Of course the ideas of the people are at the same level with their condition. No conception have they of the science of politics, of the art of ruling men so as to promote their happiness, of the engendering and diffusion of wholesome opinions, of the elevation of the masses, or indeed of the enlightening of those by whose efforts and example the masses can alone be elevated. Whatever influence is possessed by the church, is exerted to preserve the slight and doubtful foundations of her dominions. All fervour and enthusiasm are fled. A few pageants, a few gorgeous ceremonies, keep alive the melancholy reminiscences of former days. Trivial superstitions, sometimes amalgamated with those of the Indians, sometimes fabricated with the materials supplied by Catholicism, fill the minds of the rural inhabitants, while the populations of the city verge towards a rude materialism. In the country, among rich and poor, all the truths current are inculcated by legends and traditions. We subjoin a specimen related by a guide, who of course religiously believed every syllable of it:—‘In former times,’ he said, ‘three men were traversing the mountains; and evening coming on, they lighted a fire, and sat round it. It was a nasty, dark night. “Well,” said one of the men, “I don’t care for the leones” (puma)—the Chilians always call them by the name of the nobler beast, though they are infinitely inferior in size, courage, and strength, being only about the size of a large mastiff, and of much the same colour, standing perhaps somewhat lower on the legs—“I don’t care for the leones for I have a sword.” “Nor I,” said the second “for I have a lance.” “Nor I,” said the third “for I have my good faith.” Now a lion was listening all this time. “Ah,” says he to himself as the first spoke, “I don’t fear your sword. If I spring quickly, it will be of no use to you. Nor your lance” (as the second spoke): “I am active, and can avoid it: so, as I am hungry, here goes;” and he crept forward. But when the third spoke, he paused. “The sword and lance I know, and do not fear; but this good faith, what is it? It may kill or wound me. I will wait and see it.” So he trotted off, resolved to discover what this weapon was. Presently he met an old woman. “Good,” said he; “here is my chance: first I will find out from her, and then I’ll eat her. She will be tough perhaps, but my teeth are good, and my appetite very keen.” So he accosted her, saying, “Good mother, last night I sat listening to three men. One said he had a lance to defend himself with, another a sword, but the third said he had his good faith. Tell me, manita, what is this good faith?” She with great presence of mind said, “My poor dear, you ran a great risk indeed.

It is a new weapon just introduced, of so fatal a sort that only to wish ill to one who has it occasions a lingering death. Here, take this, my child"—offering a loaf—"and thank your stars you did not attack him or intend evil to me." The lion, never thinking that a poor old woman would gull him, ate his loaf, and scampered back to his family. From that day to this the lion has never preyed on human beings; he fears the good faith. Such, señor, are the miracles the blessed Virgin performs for us her humble servants who dwell in the wilds.'

Throughout South America, as well as in every other country where a heterogeneous population has been promiscuously huddled together from the four winds, the love of gambling is among the most prominent vices. Wandering creates an appetite for excitement. He who has been long accustomed to see new things every day, soon becomes satiated with novelty itself, and requires something still more exciting than the prospect of new lands and seas to gratify his craving appetite. He naturally, therefore, resorts to gambling, the last resource of minds naturally unintellectual, or exhausted by the indulgence of the passions. Extreme excitement, long continued, dulls the moral sense, and obliterates all the fine distinctions between good and evil. This indeed is the case with all absorbing passions, which hurry us on towards an object much too impetuously to allow us to reflect by the way. Mr Walpole fell in with an individual of this description at Callao. Visiting an ancient and neglected estate of the viceroy, where there was a chapel and a burial-ground, he observed a man enter, and proceed into the cemetery. It was a Frenchman, well known at Callao as a gambler, who led others into play, and consequent ruin, whose transactions were equivocal, whose conduct was loose, and whose conversation was not a little atheistical. Anxious to know the object that could have attracted such a character to this place, sacred to religion and the dead, Lieutenant Walpole followed him at a distance. He passed into the cemetery, proceeded to a little grave evidently much cared for; and kneeling down by the small headstone, first took some flowers from his bosom to scatter over it, and then bent himself in prayer. Our author left him so engaged, and the incident appears to have impressed itself strongly on his mind. This was perhaps the last link between that man and the deeper and truer feelings of our nature. In all other places and situations he was a gambler, and behaved as such, but here he seemed once more to give way to the charities of the heart.

We now transport ourselves at once to California, omitting all notice of the author's intermediate visits to various islands of the Pacific. Too much has already been written of this golden region for us to think of enlarging upon it here; but our readers will not perhaps be displeased to be introduced to a specimen of that rough militia with which the United States undertake to keep in order their outlying territories. While at Monterey, Mr Walpole came in contact with this strange legion:—"During our stay, Captain Fremont and his party arrived, preceded by another troop of American horse. It was a party of seamen mounted, who were used to scour the country to keep off marauders. Their efficiency as sailors, they being nearly all English, we must not question; as cavalry, they would probably have been singularly destructive to each other. Their leader, however, was a fine fellow, and one of the best rifle-shots in the States. Fremont's party naturally excited curiosity. Here were true trappers, the class that produced the heroes of Fenimore Cooper's best works. These men had passed years in the wilds, living on their own resources. They were a curious set. A vast cloud of dust appeared first, and thence, in long file, emerged this wildest wild party. Fremont rode ahead—a spare, active-looking man, with such an eye! He was dressed in a blouse and leggings, and wore a felt-hat. After him came fierce Delaware Indians, who were his body-guard, and have been with

him through all his wanderings. They had charge of two baggage-horses. The rest, many of them blacker than the Indians, rode two and two, the rifle held by one hand across the pommel of the saddle. Thirty-nine of them are his regular men, the rest are loafers, picked up lately. His original men are principally backwoodsmen from the state of Tennessee and the banks of the upper waters of the Missouri. He has one or two with him who enjoy high reputations in the prairies. Kit Carsons is as well known there as the Duke is in Europe. The dress of these men was principally a long loose coat of deerskin tied with thongs in front, trousers of the same, of their own manufacture; which, when wet through, they take off, scrape well inside with a knife, and put on as soon as dry. The saddles were of various fashions; though these, and a large drove of horses and a brass field-gun, were things they had picked up about California. The rest of the gang were a rough set; and perhaps their private, public, and moral characters had better not be too closely examined. They are allowed no liquor—tea and sugar only. This no doubt has much to do with their good conduct; and the discipline is very strict. They were marched up to an open space on the hills near the town, under some large firs, and there took up their quarters in messes of six or seven in the open air. The Indians lay beside their leader. One man—a doctor, six feet six high—was an odd-looking fellow. May I never come under his hands!'

Of the various islands of the Pacific visited by the Collingwood, we have little room to speak. But wherever we land, whether in the Society, or Navigators', or the Sandwich Islands, the same proofs of rapid degeneracy meet us on all sides. At Tahiti the French are greatly accelerating the process which the missionaries, with all their kind and benevolent intentions, were not able to arrest. Proofs of native vigour of character are occasionally met with, but, as a rule, the population has become languid, unenterprising, and prone to effeminacy. Even the opinions imported from Europe, which have here been found to amalgamate so readily with industry, courage, vigour, and the spirit of independence, would there appear to have contributed to extinguish the little patriotism that was left. The same causes have produced the same effect among the inhabitants of the Navigators' Islands, once among the boldest and most enterprising of the whole Polynesian race. Again, in the Sandwich Islands, the intrepidity and scorn of death which once led to great actions, now only enable the natives to perform tricks which astonish civilised visitors; while astonishing visitors render themselves more degraded and corrupt. In itself, however, the display of fearlessness, made for the most part by young women, in plunging from the tops of precipices, and committing themselves to the waters of a cataract, cannot fail to excite our admiration:—"It needed not the feats done there to make the River of Destruction worth looking at. The river ran for some hundred yards or so in rapids over rocks and stones—the banks, crags, and precipice 200 feet high, whose rudeness was softened and refined by tendrils and creepers, that hung down to the foaming water, which ill-naturedly jerked them as it rushed by. A huge rock divided the stream, one half of which dashed petulantly on, and met a noisy fate down the fall; while the other, of a milder nature, ran along a channel of sand, and fell in one heavy stream a depth of about twenty-five feet, joining the rough waters below. A little turmoil succeeded the junction; then they flowed quietly on like brothers, arm in arm, till they fell again, and soon were lost in the salt waters of the ocean.

'The great delight of the natives is to go down this fall. They sit in the channel I have described; they utter a shout, a scream of joy, join the hands gracefully on the head, and, one after another, the girls descend, emerging like sea-nymphs from the eddies below. The figure, as it gleams for an instant in the body of the water, appears to those standing below quite

perfect; and the gay shout and laughing taunt to follow has led to the death of many; for there is some secret current that not only drowns, but carries away the body too. The feat was attempted by three of our men, but none, I think, did it twice.

The descent of the lower fall is a lesser feat, and the sensation of going down it headforemost delightful. Even that, however, is often fatal; and during our stay there a man was lost merely through making a false step from the bank. The surprising agility of the women especially baffles description. One will sit by your side on the high bank, and remain so till you throw a stone into the water with all your force, then down she jumps, straight as an arrow, her feet crossed one over the other, and emerges with a laugh, holding up the stone. On first attempting to rise to the surface after going down the fall, the water seems, from the force of the current, to be matted overhead; and it is only by striking out into the eddy that you can rise: this the girls manage to perfection. They kick out their feet both together, and replaiting their hair with their hands, they float about with a grace that is beautiful to see. There the water is clear and blue, but cold, frosty, half-thawed. As lazily one watched the stream, down dropped from the ledges overhead, and cut the bright water, what soon appeared a man or woman. These ledges are fifty or eighty feet high; yet none seemed to regard it as a feat; and a merry laugh told you it was to surprise the European.

It would be rash to conclude, from the indications of decay we have pointed out, that native society must speedily come to an end in the islands of the Pacific. Probably the European element may there at least mingle surely though slowly with the indigenous races, and lead to an intellectual and moral development of which we know of few examples elsewhere. In its present aspect no population in the world is more extraordinary. The Pacific seems to be the great point of confluence at which all the families of mankind amalgamate, for there we find Red Indians from North America, Yankees from the New England States, Spaniards and half-castes from every region south of Mexico, Englishmen, Germans, Frenchmen, New Zealanders, Chinese, natives of Japan, Malays, Papuans, and Arabs. Sometimes you discover hints of singular adventures, notices of which remain on record; as, for example, where an anchor, and a skeleton with shoes on its feet, were met with on the summit of a mountainous isle: who deposited them there no one can tell. Mr Walpole apparently made no inquiries, though he states that the shoes were immediately applied to their proper use by one of the sailors. From the make of these, it might perhaps have been possible to ascertain the country of the deceased, towards which the construction of the anchor might likewise have assisted. But here the author's speculative spirit deserts him, and he does not so much as indulge in a suggestion.

In one of the islands he encountered a North American chief, who described himself as the last of his nation. Having fled, as he related, before the white men, he got on board some vessel bound for the Pacific, where he had wandered for many years, passing from island to island in the character of a minstrel, playing on a strange instrument, and relating tales of his fatherland. When old, he married a native woman, but as he had no children, his race would become extinct with him. Our readers will probably remember the story told by Ledyard of a sailor who escaped from Captain Cook's crew, allured to desertion by the beauty of a native girl; how he retired with her to the woods of the interior; and how he was pursued and captured in his retreat by the old navigator, who, though not without sympathy for the young man, was afraid, if he exhibited leniency in his case, that not a sailor would be left to navigate the ships. From that day to this, however, deserters have been numerous, so that in almost every island their families or descendants may be found. Thus is a force infused into the native character that

will probably enable it at some future day to take rank with civilised nations. Otherwise, as our dominions spread, it is evident, however melancholy may be the prospect, that they must become extinct, and leave their lands to be possessed by others.

MRS WRIGHT'S CONVERSATIONS WITH HER IRISH ACQUAINTANCE.

SCENE: A DRAWING-ROOM IN A COUNTRY-HOUSE.

Mrs Lalor. I AM so sorry for you, my dear kind friend. Your pretty boy! The fine, gay, good-natured child that every one in the country takes delight in! Is he really going to leave you?

Mrs Wright. He is indeed, poor little fellow, and very shortly.

Mrs Lalor. Now what in the world makes Mr Wright that he can never be easy till he gets shut of all his children? Why, he never leaves one with you! First one, and then another, till there won't be e'er a son at all about the house to do a hand's turn for you.

Mrs Wright. That is just the loss of having only boys. My five dear sons must each in turn leave their happy home to enter on the battle of life, and I assure you I do feel the having to part with them very acutely.

Mrs Lalor. I wouldn't do it. I wouldn't give in to any such things. It's a cruelty, Mrs Wright. And if Mr Lalor were to propose to me to part any of the children, I'd stand out against it to the last.

Mrs Wright. But what should we do with them all at home?

Mrs Lalor. Do? What do you want to do with them, but to have them about you, and to see them, and to keep them with you, and to be all happy together?

Mrs Wright. We shall not live for ever, and we must prepare our children for a future without us: think of what is for their ultimate good, and not merely indulge our own selfish affection. When we are gone, what would become of a house full of young men, poor and idle as they would then be?

Mrs Lalor. Sure Mr Wright must leave them an independence?

Mrs Wright. He will not. Not what they would call an independence. He will leave them something—a help—but not a fortune.

Mrs Lalor. Now, begging both your pardons, my dear friend, there's the mistake you've made—rearing those boys above themselves, I may say. You'll excuse me, only as we're on the subject, I'll just say out what Mr Lalor and me often say to one another—that you made gentlemen of your sons.

Mrs Wright. I am sure I hope we did.

Mrs Lalor. You did. The best of schools, a private tutor to read them through college, jaunts in the summer-time, foreign travel, trips to Dublin to see sights, a fine library collected, and frequent company. You know, my dear Mrs Wright, when there was not fortunes apiece for them, and the money wasted this way, young men with such notions will have a hard card to play with the world.

Mrs Wright. I hope not: we believed we were preparing them for the world by thus introducing them to it—filling their minds with what will hereafter be useful to them, and raising their ideas as much as possible beyond mere animal gratifications. We thought it wiser to do this than to leave them larger fortunes.

Mrs Lalor. Now, Mr Lalor and me, we gave our children a good school-education certainly; but see how we lived—scarce ever a creature within our doors, no fine servants, no extravagance of any kind, no jaunting here and there, only just laying up for those children; and very comfortably circumstanced their father will leave them.

Mrs Wright. Doing what?

Mrs Lalor. Just all living in happiness together. Ours is a most attached family, Mrs Wright. They delight in one another, and have no desire in the world, any of them, to go a foot's length from their home.

Mrs Wright. That may be very well just now. But by and by how will it do? Sons' wives, and daughters' husbands—are they all to go on living under the one roof?

Mrs Lalor. Indeed we must expect the girls to marry some day; but in the neighbourhood I hope. They'll have enough, thank God, to entitle them to the best of matches. And the boys, after a time of course, must be doing something. We've good friends, and there's little places will be casting up among all those new commissions that the country is provided with, which might be had with Mr Lalor's interest and votes in three counties, and that would keep them near us, and be a comfortable settlement. That's what we're looking to. And wouldn't it, now, be better for you to strive and do something of that sort at home for your boys, better than to send them all off this way, perhaps never to see them again? It is a duty for people to be on the look-out for their families, and not let those strangers get all the good things going. You have friends in high quarters that would push your sons on for you.

Mrs Wright. Perhaps so, and perhaps not. But I don't think my sons would be content to be pushed on by friends.

Mrs Lalor. Oh, that indeed!

Mrs Wright. Nor should we like them to accept these little, half-idle situations. We prefer them to pursue their professions; and if they succeed in the different lines they have made choice of, it is very probable they may find friends of their own making who will then assist them for their own sake.

Mrs Lalor. You're a queer woman, and Mr Wright's a queer man, and I suppose you've reared your boys in your own ways. Other people are too glad to catch at the help of a friend in these dull days. Professions require such an expense to educate for them, and take such a length of time before a guinea can be earned in return; and then there's fees, and one thing or another, and but a bad chance of success after all maybe: it's almost impossible to make out what to do with a young man, if one was ever so desirous to send him out upon the world, every sort of business is so overstocked.

Mrs Wright. Mr Wright and I don't believe in that. A large crowd, indeed, set out together on the various roads through life, but so many faint by the way, that the company thins very fast as they travel. Only the steadily industrious get well up the hill; and they are so few in comparison, that they are pretty sure of earning a comfortable provision if they proceed. When abilities are added to perseverance, an opportunity for their employment is sure to offer itself; and then good fortune, even high fortune, will be attained by the deserving—the good workmen generally finding work, you know. We have brought our children up to depend on their own exertions; and we have thought it better and wiser to devote all we could afford to what you have called a foolishly-expensive education, than to leave money behind us among those ill-fitted to employ it well. We consider that, by acting thus, we give our boys the best kind of fortune—one that they have been rendered capable of improving to any amount, and that will not melt away.

Mrs Lalor. I'll engage that none of our money will melt away either. Our children have been carefully brought up too. There's not one of them but well knows the value of a shilling. No fear but they'll keep a good account of all they get.

Mrs Wright. Will they give a good account of it? That has always been to me the momentous question. We are to answer for what we leave undone as well as for what we do. An idle life can therefore never be innocent. We have it in commission, each of us, to leave this world, as far as we are concerned with it, better than we find it, and so to consider ourselves but as stewards of all we possess in it. Money, time, abilities, temper, are all to be used for the benefit of our kind—the *Talent* intrusted to us for increase.

Mrs Lalor. Well, I never heard such strange notions. What have we to do with other people, meddling and making? Never fear, they'll look well after themselves.

Mrs Wright. When my father was a young man, he had occasion to cross over into England. It was not then, in the days of sailing packets and contrary winds, so easy a matter as it is now. In his travels he came upon an old man busy planting trees near his cottage. Stopping to speak to him, he found that this old man was childless—alone in the world, without even a near relation to inherit his cottage, and watch the growth of the newly-planted trees. 'I am surprised,' said my father, 'that at your age you take pleasure in sowing where you cannot expect to reap, when you have no one belonging to you to see that oak-sapling in its prime.' The old man looked up, and in a slightly-surly tone replied, 'An Englishman will.' The story made an impression on me as a child, but of late it has seldom been out of my mind as the key to the secret of English prosperity. We have no such *Irish* feeling: 'I for myself, and God for us all!' is our miserable motto. How can we thrive as a nation without nationality? Number one is all with us.

Mrs Lalor. Where on earth are you going on to? I know nothing of your politics, and don't wish it. All I have to beg is, that you won't be putting any of these out-o'-the-way fancies of yours into Mr Lalor's head, for he's beginning to give in to curious notions of his own, and thinks a deal of what you and Mr Wright say, and I'm determined upon this point—not to part with one of my children.

THE FRENCH POLICE BEFORE THE REVOLUTION OF 1789.

No modern institution presents a more curious subject for observation than the police of Paris. At the same time a political and civil body, it possesses an importance which no similar establishment ever perhaps attained elsewhere. Devoted to public order and salubrity, watching over the thieves and refuse population of a great capital, it is also the pillar supporting every government which has existed in France, military, monarchical, or popular. A king, an emperor, a president, a dictator, a director, is nothing without his police minister. It is therefore really interesting to have an idea of the workings of this complicated and influential machine. We find traces of it in the very earliest pages of French history; and though Louis XI. gets credit for having founded it, we discover hints about police in laws far anterior to those of this monarch. Under Louis IX., Estienne Boileau promulgated a police code which lasted until the famous Tristan—whom Scott has immortalised in 'Quentin Durward'—improved it, and laid the foundation of all the atrocities which soon were to make the institution a terror and a scourge. The post-office was invented by Louis XI. and Tristan, simply as a more sure and rapid mode of spying over the nation. This alone paints the character of their improvements, which were again added to by Catherine de Medicis. From that day until the reign of Louis XIV., the institution, demoralised and broken up by the League, remained without power or respect. Some miserable *archers*, acting solely from interested motives, hunted up or protected robbers, just as they were paid or not. The state of Paris and the country generally became dreadful. 'The citizens were regimented, elected captains, and practised arms. At the corner of every street were heavy chains, which were spread across at the first alarm. Loopholes for defence were made in every house, while the people had banners, pass-words, and places of meeting.' And this was not against a foreign enemy, but against mere malefactors. The Court of Miracles still existed—a kind of 'Alsatia' which Victor Hugo has made well known. No commissary or policeman dared enter it. All its vast population lived by beggary and crime. Marriage was

unknown in this quarter, where no authority was recognised but that of the King of the Beggars.

The first Lieutenant-general of police was selected during the reign of Louis XIV. He was Gabriel Nicolas de la Reynie. His advent was wanted. Despite the greatness of the monarch, his taste for the arts and literature, and the general prosperity of France, Paris was full of barbarism. The Cour des Miracles, the darkness, the dirt, the daily and nightly street murders and robberies, justified the saying of Boileau, 'that the most dangerous and isolated wood was a place of safety compared with Paris.' Three hundred gambling-houses, and the corporation of valets and pages who made the Pont-Neuf and the Place Dauphiné unsafe during the day, were first closed and dispersed by La Reynie. The masters grumbled. La Reynie hanged a page of the Duchess de Chevreuse and a valet of the Duke de Roquelaure for killing a student, and the murmurs ceased. A hundred fencing-shops, where men learned to commit murder at twopence-halfpenny an hour, were walled up; but the great invention of La Reynie was that of lighting the streets. The opposition of the parliament prevented his carrying this fully into effect; but he was allowed, by means of 3000 lamps, to illumine the more dangerous and obscure corners. In ten years Paris was so changed as to be unrecognisable. His mode of purging out the Court of Miracles is too original not to be recorded.

Most of the places called Courts of Miracles had gradually been destroyed; but one still held up its head in the very centre of the city, proud of its rage, of its vast population of vagabonds, of its Gothic privileges, and, above all, of its pestilential *miasma*, which kept the police at a respectful distance. Three times had La Reynie sent commissaries with detachments of horse and foot to clear the court; but each time they had been driven back. At last he went himself, determined to make an end of the intolerable nuisance.* Preceded by a company of sappers of a Swiss regiment, by 150 soldiers of the Watch on foot, by half a squadron of the soldiers of the marshalsea, by a commissary of police and some exempts, the lieutenant of police presented himself at the break of day at the door of the Court of Miracles. At the sight of the soldiers the whole of the population, women, old men, young men, children, began to yell; in an instant sharp spits, iron-shod sticks, old daggers, blunderbusses, and long knives, rose above the heads of this sinister population, in whose countenances debauchery, drink, and fury were alone visible. The soldiers, unused to such enemies, presented their arms. 'Fire not,' cried La Reynie; and then addressing the furious crowd, he said, 'I might punish you for your revolt; I might catch you all, and send you to prison or to the galleys; I prefer forgiveness, believing you to be more miserable than guilty. Listen, and be grateful: I shall make three holes in your wall, through which you may escape; the last dozen shall pay for all the rest; six shall be hung on the spot, and six sent to the galleys for twenty years.'

Terror and alarm were depicted on every face: the sappers went to work, and three holes were soon made in the dirty wall. The sappers then fell back. 'Now go!' cried La Reynie, 'and heaven defend the twelve laggards!' Never was such a rush seen before as that through the three breaches: the blind recovered their sight, the paralytic ran, lame men threw away their crutches, and in twenty minutes the whole population had vanished. An officer approached La Reynie, looking very foolish as he told that they had not caught the twelve. 'So much the better,' said the lieutenant of police; 'and lest they come back, raze the walls, and burn the huts.'

Voyer D'Argenson succeeded La Reynie, and introduced many novelties. He founded, it may be said, the secret police, the spy system, and that violation of private correspondence which has been carried on until

this day. His spy system was tremendous. He had agents everywhere, and was so successful, as to astonish the king, who asked him where he took his servants from. 'Sire,' said D'Argenson, 'from all classes, but principally among dukes and lacqueys.' The king gave an incredulous smile. 'Sire, some people cost me ten louis an hour, some ten sous!' The king laughed; and D'Argenson, piqued, promised to give his majesty a proof. A few days afterwards, the king, while dressing, and surrounded only by five noblemen of the highest rank, ventured a somewhat lively joke about an illustrious court lady. Next morning D'Argenson waited on the king.

'What is the news?' said Louis.

'Scarcely anything, sire—that is to say, at court; for at Versailles you take little interest in Paris. But, sire, I had forgotten; the retirement of Madame the Maréchale de — to a convent excites much remark.'

'Ah, ah! And what is said?'

'Faith, sire, they say, with much reason and justice, that' — and the lieutenant of police repeated word for word the joke of the king at his *letée*.

The king laughed, and promised to place implicit faith in the information of M. d'Argenson for the future. The successor of this talented individual was Michault D'Amonville, whose history is too romantic to be passed over. The Maréchal de Luxembourg was examining the brilliant lines of his army preparatory to a battle with the Prince de Walden, and was receiving with pleasure the impatient wishes of the soldiers for an engagement. Presently he reached the splendid regiment of Picardy, when a young and handsome officer, with downcast eyes, and sword bent on the ground, quitted the ranks, and demanded permission to leave the army for a few days to visit his dying father. 'Go, sir,' said the marshal with a smile—'go, and may Heaven spare your honoured father.' He then added, with a sneer to his followers, 'Honour thy father and thy mother, that thy days may be long in the land.'

The request and the answer flew along the ranks; and after the review, quodlibets fell in showers upon the young officer. He saw his mistake, and retired to his tent to think over some means of regaining his reputation for courage. A musketeer, his best friend, joined him. 'You are going home,' said he, 'at a good time. Take my power of attorney, and as you are so good a son, present my regards to my mother, that people may not say you are the only observer of the prudent commandments in our province.' A box on the ear, and five minutes afterwards a sword through his breast, was the reply which the musketeer received. 'Nocé,' said Michault, 'heaven knows I would have given my life to have avoided this; but you can now say that Michault D'Amonville is not a coward, but that he loves, before glory, before the king, before what is called honour, his father, his old father, his first and only friend. I now break my sword for ever; but count eternally on my friendship and esteem.'

Some years afterwards, Nocé became captain of the horse grenadiers, aide-de-camp and knight of St Louis. A troublesome adventure nearly stopped his career. Therese, the lovely daughter of a respectable merchant of the Rue St Denis, was the object of universal admiration. Nocé fell in love, and resolved to carry her off. One night, aided by friends, he placed a ladder beneath her window, broke a pane, entered, wrapped the young girl in her bedclothes, and descended to the street. Struggling violently, Therese succeeded in freeing her head, and shrieked. The Horse Watch came up, and Nocé was arrested with the girl in his arms. In an hour after he was at the Bastille. Nocé tried to make good his influence; but the king, guided by Madame de Maintenon, stood firm, and the parents of Therese were allowed to prosecute. Michault, now a leading man at the bar, heard of the affair, and rushed to the Bastille, where he was received with open arms by the young count. Nocé had no hope, but he gave up his case to Michault. The lawyer hastened to the Rue St Denis, and ad-

* This Court of Miracles was near the Porte St Denis, where now stand the Rue St Foie, and numerous other streets.

dressed the parents of Therese thus:—'The Count de Nocé is in the hands of justice; he merits his fate, and I neither come to defend his insolence nor his crime. But what are you about to do? To aggravate a scandalous fact by a scandalous trial. A verdict will be yours; but will this verdict repay the shame of a public examination of your child before the judges. Withdraw your prosecution. Content yourself with receiving the excuses in open court of Count Nocé before ten nobles and ten citizens.' The parents seemed moved. Michault continued, 'I am a lawyer, acting for a friend who wishes to give reparation. M. Perier,' addressing the father, 'you shall be *cohevin* at the first vacancy. Here is the written promise of the provost and the governor of Paris. You have a nephew *curé* of the little parish of St Pierre-aux-Bœufs; here is his nomination as *curé* of St Gervais. Besides, I beg to present to you your brevet as embroiderer to the House of Orleans.' Before Michault withdrew, he had their withdrawal of the prosecution in his pocket; and next year Therese became Countess-Palatine Stanislas-Lubomiska de Bandonier: she lived universally admired in Poland for sixty years afterwards. In 1715 Nocé proved his gratitude—Michault became lieutenant of police. He was, however, very incapable, and was speedily replaced by Pierre-Marc Voyer D'Argenson.

This lieutenant did much for Paris. The depraved manners of the upper classes he was compelled to wink at, encouraged as the bad state of morals was by the regent. But while the aristocratic vagabonds of the Palais-Royal and La Muette were allowed to beat the watch, insult women, and break lamps, Voyer D'Argenson made pitiless war on the thieves and poor rogues. Thousands of sham marquesses and counts went to prison, and all the scum of the capital found themselves under strict regulations. The splendid Boulevards were then dismal muddy ramparts, unsafe after dark: D'Argenson lighted them from the Porte St Honoré to the Porte St Denis, and built guardhouses every 1500 yards. The result was great. More severe than his father, he punished a fault similar to that committed by Nocé with two years' residence in the Bastille. Teschereau, his successor, had a mania for knowing all that was going on in every house in Paris. He hired regular spies, he bribed barbers, coachmen, porters, servants, clerks, and persons of the lowest description; he authorised gambling-houses, fencing-schools, and every other receptacle of vice, and spread corruption while pretending to use the means of repression. His great object was to know the secrets of families, and to have stated haunts for vagabonds, that he might easily find them. Ravot d'Ombreval, an austere, classical student, who followed him, endeavoured to introduce rules copied from the ancient republics of Greece and Rome. Some were failures, and only served as matter for the jokes of the court. But one was admirable. A gentleman was killed in a hired carriage. Ravot at once made a regulation by which no carriage could ply for hire without having a number and a license. This was the commencement of the present excellent cab system of Paris. But the ridicule of the court caused Ravot to resign, after having closed every house in which gambling was carried on. Hérault de Vaucresson, his successor, began well. Until about 1730, Paris was a labyrinth of streets without written names. Vaucresson was the first who placed names at the corners of the streets and numbers on the houses. His plan was to cut out the words in a stone tablet; and many old streets still retain durable evidence of the excellence of the plan in the presence of the very tablets placed on them by this lieutenant. He then removed all the receptacles for the filth collected in the streets to outside the city, and put an end to the stealing of bodies for the surgeons from the cemeteries: he almost cleared Paris of sturdy beggars and vagabonds; and died, after fourteen years of admirable administration, regretted by all classes of citizens save rogues and malefactors.

Feydau de Manille, who followed, began by starting

cheap and amusing theatres for the people, to draw them from the religious disputes of the Sorbonne. He then endeavoured to remove the slaughter-houses from Paris, the population of which objected both to the existence of these nuisances, and the driving of animals through the streets. But the ardent opposition of the butchers retarded this reform, which was carried out by Napoleon in 1805. After clearing many quarters of Paris, he built a splendid hotel and new quarter still called Feydau, and paved for the first time the quarters St Germain, the Faubourg St Martin, St Denis, and St Marceau. He so perfected the regulations relative to public vehicles, that not one robbery or murder was charged to the coachmen during his time of office.

Paris has always been disgraced by a vast number of carts and trucks drawn by men, which adds much to the mortality of the capital. Feydau tried in vain to abolish this system, and none of his successors have cared to try it again. Berryer de Ravenonville was too much of a fine gentleman to imitate his predecessor. The creature of Madame de Pompadour, he cared only to serve her. All the energies of the police were devoted to discover plots against the favourite, and to furnish her, from private letters broken open, stories to tell the king of his courtiers. Robbery increased; murders were committed in the open day; bands of thieves were organised; and yet the police took no care, until, in 1752, the nuisance had become intolerable. Berryer seemed suddenly to awake, and he resolved to clear Paris of its vagabond population. Men, women, and children, were seized and carried off to the Temple, and then sent off every day in bands of two hundreds to Louisiana without any form of trial—a peculiarly French system of justice and colonisation, two things even yet little understood on their side of the water. This summary process caused an *émeute*, beneath which Berryer fell. The disappearance of so many children created an absurd report that they were killed to make a bath for the Dauphin, attacked by paralysis. The people became wild with rage, rose *en masse*, attacked the hotel of the lieutenant of police, and were only prevented from killing him by his timely escape. Bertin de Bellisle was his successor. He made some good regulations, amongst which was that which prohibited milkwomen, mountebanks, and others, from using drums and trumpets in the streets. Sartines was the next, and under his rule vast improvements were made in Paris. He used to describe his duties in three words—safety, cleanliness, light; and he went seriously to work to carry out his motto. He reorganised the watch; he established street sweepers; he replaced the little lights by large lamps; he ordered all doors leading to courts to be shut at nine o'clock; purged the commissaries of all the idle and lazy; reformed the theatres; and made Paris, indeed, safe, clean, and light. Sartines carried his spy system to a vast extent. Not only did he profess to know *all* that was going on in Paris and France generally, but to be aware of all important things in every European capital. One day he received a letter from Vienna informing him that a famous brigand, who had long desolated Carniola and Carinthia, was in Paris, and requesting that he might be arrested. Sartines replied that the brigand was not in Paris, but in Vienna itself, in such a street, such a house, and at such a number. The German police made the proper researches, and found the robber hidden in the place indicated.

A servant of the pope ran away from Rome, after having stolen from the *sacristie* of St Peter a great number of sacred vases and pontifical ornaments, worth a considerable sum. The papal government supposed that the thief had embarked in a French merchant vessel, and passed into Provence. The apostolic prothonotary sent a courier to M. de Sartines, in order that he might stop the malefactor at his entrance into France. The lieutenant of police at once sent back the courier, after writing on the back of his despatches, 'The robber sought for by the Roman police has not entered France. He is hidden at Civita-Vecchia in a Sicilian

bark, whose master is called Bartholomeo Fraudi; his intention is to go to Messina, thence to pass into Turkey. Be quick, and you will catch him at sea.' The pope, on receipt of this laconic missive, armed a brig and a galley, and succeeded in catching in the waters of Messina the Sicilian bark of the master Fraudi, which bore the robber and the rich spoils of St Peter. And all this wonderful information cost Sartines less than a bad management of the police, simply because he was honest.

Sartines employed repentant thieves and reformed convicts for purposes for which no one else would have proved efficient. Many persons reproached him with this, but he replied, 'Tell me of one honest man who will be a police spy?' He had particularly about him four ex-thieves—the cleverest—whom he called his aides-de-camp. One evening during a conversation at Versailles, much was said about the cleverness of robbers, when the Prince de Beauveau contended that no man who was careful could be practised on by a thief. 'If you will dine with me to-morrow,' replied Sartines, 'I will convince you of the contrary.' 'I bet you three hundred louis that you will not succeed.' Sartines accepted, and the prince laughingly observed that perhaps he would take his purse or his snuff-box, but that that would be nothing very new. The lieutenant of police informed him that he intended his cross of the St Esprit should be taken off his breast without his knowing it. The prince, somewhat startled, still expressed his doubts, and then invited all around to witness the winning of his wager. The dinner was splendid. More than a hundred guests were present. Courtiers, distinguished foreigners, authors, poets, crowded round the board. Opposite the Prince de Beauveau sat a Chevalier de Calatrava, attached to the embassy of Spain. The conversation was general—fine arts, literature, philosophy, were treated with tact and good taste by the brilliant assemblage. The prince, enthusiastic about Italian literature, entered into a warm discussion with the Chevalier de Calatrava, who quoted largely from Cervantes, Lopez de Vega, and other Spanish writers. At last both the prince and the chevalier got warm, and their discussion was degenerating into a dispute, when Madame Sartines held out a purse, saying, in a gentle tone, 'For the poor, my lord, if you please.' De Beauveau looked at his breast: the cross of the St Esprit had disappeared. The prince smiled, and glided a bill of five hundred louis into the hands of the fascinating lady of the minister of police, who himself handed back the decoration. Everybody now asked how the thing had been done? 'I should keep my secret for myself,' replied Sartines, 'but I cannot resist so general a demand. The task was difficult, tied, as the cross was, in so tight a knot. While Monsieur the prince was discussing with the amiable and learned De Calatrava, whom you will never again see at my table, another of my aides-de-camp under the table thrice drew his napkin off the prince's knees. Three times M. de Beauveau stooped to pick it up, and three times my rogue was master of the cross. But I wanted it, ribbon and all, uncut. At the fourth fall of the napkin the thing was done.'

This kind of police is so different from anything in English manners, that another anecdote of the same lieutenant can scarcely be passed over in silence. A magistrate of Lyons once said that he was sure he could enter Paris without the knowledge of M. Sartines. 'Don't be too sure,' said the lieutenant. Six months after, the magistrate had occasion to visit the capital. He recollected his conversation. He left Lyons mysteriously, entered Paris at night, and took a lodging in a false name in an obscure quarter. At dawn of day a livery-servant awoke him. In his hand was a letter. It was an invitation to dine that day with M. Sartines! But Sartines had other qualities besides having a hundred eyes. He was bold and humane, firm and charitable. A terrible *émeute* held possession of the Place Maubert. He marched upon it with a powerful force; and after presenting arms, whispered to a young

officer, who advanced to the crowd. 'Gentlemen,' said he, using the words whispered by his chief, 'we come here in the name of the king; but we have orders to fire only on *la canaille*. I beg all honest people to retire before we act.' In five minutes not a rioter remained.

Paris owes to this eminent individual the corn market, and a gratuitous school of design for the poor, fourteen fountains, the paving of half the streets, and many other things which testify to the utility of a good police. Lenoir, his successor, occupied himself with improving the prisons and hospitals, in the latter of which, despite the wealth of the corporations, four slept in a bed. Lenoir ordered that only two should henceforth occupy one couch, which was a great improvement. He regulated the food, which was too rich and abundant, and suppressed in the prisons chains and dungeons. Before Lenoir's time, six prisoners out of twenty-eight died every year; after one year of the new régime, only twelve in one hundred died. Cleanliness and wholesome food produced the change. In Paris nearly every child is sent into the country to be nursed. Before Lenoir's time, women went about from door to door seeking babies, and carried them off to far distant parts. As often as not they brought back a child of their own when the one confided to them died. Lenoir established a regular office, with strict surveillance over the nurses. He created a body of firemen, and stopped the abominable usury imposed by Jews on the poor, by the formation of the Mont-de-Piété, which lent money on pledges at moderate interest.

Andre-Albert did much, and was succeeded by Du Crosne, who was the fifteenth and last. To this man Paris owes one great improvement. From the time of Philippe-le-Bel, the cemetery of the church of Saints-Innocent, Rue St Denis, was a burying-ground. A dark gallery, with on one side shops of fashion, on the other a wall of bones taken from the cemetery, was a dismal feature of the scene. The cemetery was the fertile source of disease to the whole crowded neighbourhood. Du Crosne obtained from the king power to destroy this nuisance, and the remains of 1,600,000 bodies were so carefully removed under the auspices of able chemists, that no evil result followed. The church was pulled down, and the splendid fountain, which still adorns the spot, erected in its place.

The police, before the Revolution, it will be observed, did, on the whole, more good than evil. They were, it is true, the instruments of very bad acts; but had the government always chosen such men as Du Crosne and Sartines, there would have been little to blame in the institution. Like most French organisations, its faults lay in its arbitrary character. There was no legal line of conduct, no bounds to the will of the chief, who was always quite as powerful for bad as for good. In a future paper, an examination of the police since the Revolution will show that the change has not been for the better.

OCCASIONAL NOTE.

COLONISATION AIDED BY LIFE-ASSURANCE.

PROFESSOR DE MORGAN, the first living authority on assurance, has said of it, that 'though its theory has as yet only been applied to the reparation of the evils arising from storm, fire, premature death, disease, and old age, yet there is no placing a limit to the extensions which its applications might receive, if the public were fully aware of its principles, and of the safety with which they might be put in practice.' Two companies have just been formed in London to employ this grand principle, which has made arithmetic the best friend of humanity in advancing colonisation. How can this be done? The company purchases lands in the colonies. A proposing settler, with a small capital, takes out a policy of life-assurance with the company for, we shall say, L.100. He settles on (say) one hundred acres of the company's lands, on the proviso of paying the company a certain annual sum till a certain period of his

life, when it becomes his in fee-simple, or till his death, when it will be the property of his representatives. If (say) thirty years of age, and he wishes that the farm should be his own in fifteen years, if he lives so long, he pays L.11, 8s. 11d. per annum; if he desires that it shall only come to his heirs, he pays L.7, 4s. 1d. per annum as long as he lives, and, though he die in the first year, these heirs will inherit the property without farther charge. The payment, as will be understood by those conversant with life-assurance, includes a rent for the land, to reimburse the company as landlord, and a premium of assurance for the sum assured, by which the purchase of the land is ultimately effected. The benefit of the system is, that a settler gets upon land without the necessity of laying out a large sum at once in purchasing it. He is enabled to reserve the bulk of his little capital to stock his acres, and to support him over the first difficulties—a matter of vast consequence to him. At the same time, as we presume, the company makes a profit upon both the land and the policy of assurance in requital of its outlay and its risk.

There can be no doubt that the scheme of the two companies, whose prospectuses we have seen, is theoretically correct and equitable; and that, with energy and good intention, it may be worked out to the vast benefit of the class of intending emigrants whose capital is limited. Recognising some names of high respectability in the lists of directors, we are inclined to look hopefully for results. One advantage, entirely incidental, will flow from the plan. The companies being presumably careful in the selection of their lands—for this is strictly their own interest—intending settlers will be able to go at once to their allotments, thus saving the large and often ruinous outlay which individuals now incur in choosing lands for themselves. In fact, by the simple expedient of a life-assurance company being brought to bear upon colonisation, it appears that we shall at length obtain, what has hitherto been so desirable, the help of intelligence and wealth to that business, free of any risk that the poor man may be victimised in the choosing of his land.

THE LOVE OF THE MINUTE.

Women certainly are fortunate in a turn for the microscopic or minute, and for those occupations which can be performed while sitting still, or which require movement in a limited circle only. Their Clarissa-like genius for weaving page after page of letter-writing, or, in other words, for that interminable piece of chequer-work, dark and formidable, the crossed-letter—ever extending it unsparingly in whatever corner the white surface of the paper shows itself, down to the crossed line of the last page—is quite an immediate blessing of Heaven; while their talent for forming friendships with birds and gold-fish—their craze for administering slop and flattery to the young of animals, as if they were young children—their incredible patience under an infliction of plants or flowers, over which they will sometimes meditate and regard as if they were endeavouring to pass the bounds of human knowledge, and to enter the mystery of vegetable life—and their great instinct for making themselves endlessly happy with the vast subjects of dress—are endowments which must be referred to the same category. These resources are their salvation in many strange situations, in which it would go hard, we suspect, with male faculties.—*British Quarterly Review*.

CALVIN IN GENEVA.

The most trifling slights and insults, such as most men would have overlooked with contempt, Calvin pursued with bitterness and acrimony. The registers of Geneva abound with instances, which grew more frequent and more severe as his power became more consolidated. In 1551 we find Berthelier excommunicated by the consistory because he would not allow he had done wrong in asserting that he was as good a man as Calvin. Three men who had laughed during a sermon of his were imprisoned for three days, and condemned to ask pardon of the consistory. Such proceedings are very numerous, and in the two years 1558 and 1559 alone, 414 of them are recorded! To impugn Calvin's doctrine, or the proceedings of the consistory, endangered life. For such an offence a Ferrarese

lady, named Copa, was condemned in 1559 to beg pardon of God and the magistrates, and to leave the city in twenty-four hours, on pain of being beheaded.—*Dyer's Life of Calvin*.

LINES WRITTEN AT KESWICK IN JUNE 1849.

NATURE awakes! bleak winter's reign is o'er,
The voice of joy is heard from shore to shore;
A thousand odours on the gale are borne
From blushing fruit-trees and the snowy thorn;
The calm blue lake is whispering to the beach
In tones more eloquent than mortal speech;
And where the sun sheds his most ardent rays,
Bright stars of gold dance in an airy maze;
And where the shadows of the mountain rest,
A tiny sail lies slumbering on its breast.
Woods fringe the lake in every green arrayed,
And I sit musing in their welcome shade.
The earth is decked with flowers of varied hue,
Gay as the dreams of hope, as transient too!
The wood anemone—that nun of flowers!—
Loves shady woods and unfrequented bowers;
Primrose and violet, gay furze and broom,
Scatter from out each chalice rich perfume;
The azure bluebells bend their graceful stems,
The fragrant cowslip every meadow gems,
The starry stitchwort 'neath each hedge abound,
And golden buttercups spring all around:
In sheltered spots or mossy bank is seen
A slender stem, with three bright leaves of green:
The flower a cup for fairies well may be,
When blithe they dance beneath the greenwood tree.
White, pencilled o'er, the sorrel: pale but gay,
Which—leaves, or flowers—are fairest who can say?
While oft we see in many a shady spot
The turquoise of the field—forget-me-not;
And pleased I watch that messenger of spring,
The gorgeous butterfly, on painted wing;
Black spangled o'er with scarlet, blue and white,
It wings from leaf to flower its mazy flight.
Sounds, too, are there—the hum of insect life;
With happy creatures earth itself seems rife.
The gush of streams, the ripple of the lake,
The ringdoves cooing in the woody brake,
Mixed with the dulcet cuckoo's voice, they float,
And every warbler adds a tuneful note—
A clear warm mist tumbles o'er hill and flood,
And scarce a zephyr whispers through the wood—
My mother earth smiles as she smiled before—
But bounds my heart with rapture as of yore?
Where is the thrill with which I used to meet
Young spring's advance, and trace her fairy feet,
When I, like nature bounding from the birth,
Tasted pure pleasure, shared the joy of earth?
Gone the elastic step, the joyous start;
The memory of its echo chills my heart:
The landscape seems unreal, sounds a dream,
And tears burst forth to mourn what I have been.
But still these tears are soft, this sorrow brief;
These are the tears which bring a kind relief.
A thousand soft emotions crowd my soul:
Alone with nature, far from man's control,
Who could be sad who looks on scenes like these?
Light in each sunbeam, hope in every breeze,
I learn to tread the dusty path of life,
Despite its sameness and its heartless strife:
Trees, flowers, and birds rejoice; then why be sad?
They whisper, join us! and I too am glad!

IDEAL BEAUTY.

THE numerous hypotheses of beauty that have been submitted from time to time to the world have not yet resulted in any undoubted theory; yet each attempt to penetrate the mystery which hangs over the subject must serve more or less to refine and elevate. Anything that withdraws us, in our reflective moments, from the materialism of circumstances, must aid the advancement of civilisation; for civilisation does not consist in the *perfectionnement* of the mechanical arts of life, but in the cultivation of the higher faculties of which the senses are but the agents and ministers. The splendid inventions and endless applications of the present age would obtain for it merely the praise of ingenuity; but the simultaneous diffusion with these of a taste for poetry, music, and art, stamps the epoch as a period of indubitable progress.

The analysis even of so ethereal a thing as beauty is no more impossible to one class of philosophers than that of light has proved to another; and the former, in all probability, depends upon laws as simple as those of the latter: for the principles of nature are few and universal. The time has gone by when the mystery of beauty was committed wholly to the researches of the metaphysician, and some inquirers seem now inclined to revert even to those earlier dogmas which placed the secret in the keeping of the exact sciences. It has long been known that the Egyptian sculptors reduced proportion within such definite rules, that the parts of a single statue might be executed by different artists; and the school of Pythagoras—who studied in Egypt—taught that the foundation of proportion, both in sculpture and architecture, was geometry. This is a question, however, too weighty and too curious to be entered into parenthetically, and we shall reserve it for a future occasion, when we propose examining at large the contributions of D. R. Hay to the philosophy of art.

Ideal beauty, a higher branch of the same subject, was still farther removed from the grasp of the judgment. Its discussion was supposed to be the province of the poets and transcendentalists; and when actually met with in high art, it was set down as the result of a special inspiration which had nothing to do with the vulgar laws of nature. Ideal beauty, however, is now pretty generally acknowledged to be a real existence, in which the efforts of nature in the creation of the perfect are merely concentrated by the master in a single figure. The same thing, we would remark, occurs in landscape painting, and is there considered no mystery at all. The artist in this case does not copy, but select from nature. He imagines such a combination of circumstances as never occurred in union, though all real in themselves, and thus produces out of actually existing materials a scene of ideal beauty.

Let us only suppose what the result would be of the introduction of a feature that was *not* natural into the ideal of the human form. The piece would be at once condemned as 'out of drawing'; in other words, it would be stigmatised as wanting in the first principle of art. Such views of the question would seem to imply that the great artist must be deeply learned in the arcana of knowledge, and it may be asked how, in this case, it happened that the ancients—of a time when learning, such as it was, was confined to a few—have been the masters of more generally enlightened generations, and that their unapproachable works are still the objects of the 'fond despair' of the modern world? The answer is easy: That inborn genius is the teacher, or rather inspirer of art. Thus Homer had no education in the common sense of the word—and neither had Burns; yet both, in certain departments of the sister art, stand unrivalled and alone. These, however, are the cases of individuals, occurring with an interval of 3000 years; and the collateral inquiry remains—under what circumstances was this divine quality developed among a whole people at one time, and what led to its decay and final extinction? At this point the work which has suggested the train of thought we are indulging comes to our assistance, and—though not without some precautions—we put ourselves under the guidance of a masterly writer, but occasionally an incorrect thinker.*

The climate of Greece is supposed to have had some influence in forming the happy disposition of the people. 'Here,' says Winckelmann, 'where a temperature prevails which is balanced between winter and summer, nature chose her central point; and the nigher she approaches it, the more genial and joyous does she become, and the more general is her influence in producing conformations full of spirit and wit, and features strongly marked and rich in promise.' In such a climate physical man acquires his fullest development, and physical beauty its richest character; and in such a climate the powers of depiction and imagination would be in equal proportion with the glorious materials they had to work with. But too much importance, we think, is attached to this idea. Climate does not in other countries generate genius, although it may develop form; and, as regards the fine arts, our author forgets that the palmy period of sculpture, if we begin with Phidias, did not last for more than fifty years; and that the painting of the early Greeks, exemplified in the works of Apollodorus, Xeuxis, and Apelles, of which not a fragment has been preserved, exists only in the traditionary praises of Lucian, Pliny, and Ausonius.

But the climate of Greece was not too cold to repress

* The History of Ancient Art among the Greeks. Translated from the German of John Winckelmann, by G. Henry Lodge. London: John Chapman. 1850.

the animal spirits, nor too warm to enervate. The people did not, like more western nations, shroud their forms in heavy clothing, nor, like more eastern, commit the manly and graceful exercises to slaves and hirelings. The richest, noblest, and wisest strove in the public games, and the taste for beauty in the human form grew by what it fed on. In their histories, they mention with applause those whom this quality distinguished as favourites of the gods; women contended publicly for the prize of beauty; the Spartan matrons placed in their sleeping-rooms the images of the most graceful deities; and even men were known by a name derived from some perfection of shape or feature. Of these last one received an appellation which has been transferred in meaning, by the different genius of English poetry, to the fairer sex:—

—* A thousand graces sat
Under the shadow of her even brows.*

This love of beauty was conjoined with gentle hearts and joyous dispositions. Kindly in peace, and humane in war, they formed a remarkable contrast to their future masters, the Romans; and when it was first proposed to introduce the gladiatorial exhibitions of the latter at Corinth, some horrified Greek observed that they must first throw down the altars of Mercy and Pity.

The attention of this beauty-loving people was early turned to sculpture as a means of perpetuating the memory of the charms they almost worshipped. Statues became the universal expression not only of admiration, but even of family affection. Mothers set up the images of their children in the temples; and whole towns and provinces joined in honouring in this manner the victors at the public games. The sculptors were the sole bestowers of that enduring fame which mortals call immortality. Philosophy and literature were subordinate to art; and to obtain a prize beyond what these could give, Pythagoras contended at Elis, and Plato appeared among the combatants at the Isthmian and Pythian games. Such statues were always portraits, and so likewise were the representations of the successful horses at the chariot-races. Even the superstition of the Greeks contributed to dignify art. The early images of the deities, whose authors were unknown, were supposed to have fallen from heaven; and even those by known artists were understood to be filled with the godhead they represented. How sensibly must the honour in which art was held have acted upon the artists! The contentions for the prizes of beauty and skill must have been tame in comparison with those of genius.

Let it be understood that the praises bestowed upon a successful artist, universal as they were, were no vulgar and ignorant outcry of fashion. The learning and wisdom of the time were comprised within a small compass, for there were few books to study, and a brief space, therefore, sufficed for all necessary culture. Men did not require to grow gray in thought before they were considered competent to lead the nation; and thus we hear of mere lads gaining battles; of a commander-in-chief of the age of twenty-four; and of the chief of the Achaean League—Aratus—being scarcely twenty. It is curious to remark the recurrence of this phenomenon in our own day in England, though arising from a very different cause. The present is the age of extraction and simplification. The multitude of books that have inundated the world are all robbed, by a process of distillation, of their actual spirit; and the result is presented to the new generation in a cheap, attractive, and intelligible form. It is almost as easy now to be wise and learned as it was in ancient Greece; and thus we see every day young men stepping forward into public life from the most uncongenial positions, and displaying a readiness and familiarity in business which were formerly supposed to be the exclusive attributes of mature years and prolonged study.

We now come to the crowning influence which carried Grecian art to perfection. This was the lofty spirit of independence which secured in most ages the freedom of the country. 'The freedom,' says Winckelmann, 'which gave birth to great events, political changes, and jealousy among the Greeks, planted, as it were, in the very production of these efforts, the germ of noble and elevated sentiments. As the sight of the boundless surface of the sea, and the dashing of its proud waves upon the rocky shore, expand our views and carry the soul away from, and above, inferior objects, so it was impossible to think ignobly in the presence of deeds so great and men so distinguished.' So long as Greece was free, or even underwent brief vicissitudes of tyranny, art continued to advance till it attained to perfection; but when the country fell permanently under the Roman yoke, art gradually expired. It is a plant to which light and air are necessary, and if transferred to a dungeon, it withers and dies.

It must not be supposed that the period of perfection of which we have spoken dawned all at once. The germ of genius was in the national mind, but it required time to develop itself; and manifold were the efforts of sculpture in the interval between the representation of Castor and Pollux by two wooden posts with a cross-beam at the top, and the production in marble of 'the statue which enchants the world.' The statues of the victors in the games, as we have observed, were portraits, and so likewise may have been those of the priests and priestesses of the temples; but the images of the gods were creations of ideal beauty, or that perfection of beauty which surpasses nature, inasmuch as it concentrates her scattered gifts in a single form. But the fine imagination of the Greeks did not stop here. They revelled in beauty with a kind of intoxication; and in the images of certain gods, such as Apollo and Bacchus, as well as in the Hermaphrodite statues, they blended the forms of the two sexes, and thus composed out of nature's own materials an imaginary being peculiarly their own. But let us hear the description of our German enthusiast of one of the ideals of the Greeks: 'I could wish in this place,' says he, 'to describe beauty the like of which can hardly have had human origin. It is a winged genius in the villa Borghese, of the size of a well-made youth. If the imagination, filled with the single beauties everywhere displayed in nature, and occupied in the contemplation of that beauty which flows from God, and leads to God, were to shape during sleep a vision of an angel, whose countenance was brightened by the divine effulgence, and whose form was seemingly an effluence from the source of the highest harmony—in such a form let the reader set before himself this lovely image. It might be said that nature, with God's approval, had fashioned it after the beauty of the angels.'

This high and holy quality of beauty has been long the subject of controversy. Men have sought to embody it in a definition, and numerous theories have been propounded, by which the authors imagined that they had solved the problem. It is natural that we should wish to know *what* it is we unconsciously admire, and *why* it is that we do so; but no explanation has as yet been made public that can satisfy the judgment or engage permanently the attention. One of the latest adventurers in this difficult field is Winckelmann himself; but although his premises are indisputable, and his sketch of the history of the beautiful in art both striking and correct, he has been no more successful than his predecessors. Indeed the question of 'what is beauty?' seems to have been abandoned as hopeless, and both Winckelmann and Haydon, after floundering from obscurity to obscurity, have been satisfied with telling us *where* beauty is. The former supposes it to reside in the youthful form, 'in which everything is, and is yet to come—appears, and yet does not appear,' and where 'the conformation is, as it were, suspended between youth and maturity.' He does not deny its existence in other periods of life; but youth is the grand central

point, and the farther from this the rays of beauty diverge, the fainter they become.

To this dogma it has been objected, that in the works of the ancients themselves—more especially in the Venus, the second daughter of Niobe—the palm is clearly seen to belong to maturity. But we venture to impugn it on wider grounds. Even supposing beauty to be confined to the human form, it belongs to all ages and states—even to declining years—even to death itself. In the latter it perhaps reaches its acmé, and the 'rapture of repose' we see in the coffin before the commencement of decay, is more lovely than the brightest flush of youth. But beauty is not confined to the human form: it is a universal principle, which pervades all nature; and the dogma which assigns it to a particular period of man's life must be tried by its application to every other object and condition which exhibits the phenomena of youth and decay. Winckelmann's idea, therefore, we condemn as unphilosophical; and for the same reason that of Haydon, who declared that beauty resides only in the female form; and that when seen elsewhere, in any individual of the whole animate world, it is in exact proportion to the resemblance of that individual to woman.

The most curious, however, of all theories of beauty is, we believe, the latest—the one propounded by Dr Knox, and now reproduced in an appendix to his translation of Dr Fau's work on anatomy.* 'All those beautiful and perfect external forms,' says he—'this decorated exterior, which nature intended man to see, concealing from him the machinery lying beneath the surface—owes its beauty to many circumstances, which I need not here further refer to, but chiefly as a *sine qua non* to the cellulo-adipose elastic layer interposed between the integument and the aponeurotic sheaths and muscles.' Here are words to conjure with! But lest the reader should turn over the leaf in dismay, we shall explain that our author means simply to say that beauty mainly consists in the concealment of the internal structures of the human frame. This theory, he says, 'is based on transcendental anatomy, and on an analysis of human feelings and instincts. Apply it to the living model, and test its truth; apply it to modern sculpture; above all, to the antique, from a profound study of whose sculptured forms I first drew the materials of this work.'

Such are the notions of a professional anatomist, to whom the play of a muscle in the graceful attitudes of youth, or the course of a blue vein over a virgin bosom, recalls the horrible mysteries of the dissecting table! But to the uninitiated such muscular movements, even when unpleasing from their extravagance, suggest nothing to disgust; and such meandering veins are, and always have been, nothing less than poetical. When a blush rises into the ingenuous face, we do not associate it with a determination of blood; a smile receives no illustration in our fancy from the demonstrations of the knife; and a tear suggests to us no hint of the analysis or organs of the secretion. Dr Knox, however, though wrong in theory, is right as to practice. In youth, the muscles and sinews are far from being obtrusive, either in the living model or the statue, and they are but little obvious in the ideal beauty of the ancients even when it refers to maturity. The reason is, that tranquillity and repose were the grand principles of the old sculptors' art. Even the dancing nymphs do their spiriting gently; Laocoon's sufferings, though agonizing, are mute; and the daughters of Niobe are as still as the death they dread. This was one of the most remarkable characteristics of Grecian art, and it is the one most commonly disregarded by the moderns, with whom all is excitement and extravagance. In Greece it arose out of the national manners, at a

time when hasty walking or hurried speaking was reckoned a vulgarity, and when a calm, self-possessed manner indicated high-breeding.

Dr Knox having told us what beauty is, proceeds, like his predecessors, to show where it resides; and here he agrees so far with Haydon, although giving it a more limited range. 'The absolutely beautiful,' says he, 'I place in the full-grown woman only, in that figure whose fully-developed proportions satisfy the most fastidious taste for form; whose expression no language can describe, yet is understood by all; in whom the emblems of ever-blooming youth—that youth so cherished, so loved, so adored—still remain, thus combining all possible attractions.' If such mean and restricted views could be accepted at all, this one is certainly the most natural and probable.

It will not be supposed that where so many men of genius have failed, we shall hazard an opinion with any confidence, or with anything but hesitation and humility. It strikes us, however, that the cause of the failure may lie in the want of elevated views both of nature and art—views apart from the enthusiasm, real or pretended, of connoisseurship; and we may venture, therefore, to offer a suggestion which has but little reference to learning or study.

The writers we have mentioned, as well as others who preceded them, describe the chief component parts of beauty as consisting of proportion, colour, and expression. But if you detach from a thing any one component part, you leave it imperfect: in the chemistry of nature, for instance, such withdrawal, in the case of the gases that compose air and water, would destroy the whole animated world. How does this apply to art? The masterpieces of the ancients, the exponents to all mankind of the idea of beauty, are generally in discoloured marble, sometimes in bronze—where, then, is colour as a component part? If expression were detached from them, is it not obvious that this would change merely the moral character, without affecting in the smallest degree the physical beauty? What remains is neither marble nor bronze: it is proportion. If so, Proportion is Beauty. If the living model, however finely formed, were, by some caprice of nature, to appear of a green colour, it would still be beautiful to the eye of taste, however abhorrent to the natural instincts. We have a strong suspicion that it is the confounding of taste with instinct which has restricted the views on this subject of so many talented men, and which, more especially, has imprisoned beauty in the youthful and female forms.

That the Greeks possessed mathematical rules of art—a supposition which is sneered at by Dr Knox—we have no doubt; and the fact is rendered probable by a circumstance adverted to by himself as well as others—namely, the absolute identity, in feature and character, of all the statues of the same god. This identity is so remarkable, that if the whole of one of these sculptures were lost with the exception of a portion of the hair, the deity represented could be at once distinguished by a connoisseur! But setting aside this question, which, as we have said, will be the subject of a future paper, it is hardly reasonable to suppose that mathematical rules could enable the artist to give the Vatican Apollo his cloudland step, or the Atalanta her gliding motion. Such rules are, as it were, the body of beauty, but genius breathed into it a living soul. We have seen by what happy combinations and coincidences this genius was able to develop itself in the Greeks; but with nations different from them in climate, constitution, religion, manners, and freedom, the process will not be the same. The feeling of ideal beauty is not an instinct. It must come by study, by meditation, by abstraction from low desires. It must come with the great truth that beauty, so far from being confined to persons and places, is universal and ubiquitous. It must come with the power to separate it from the association of a passion with which it has no necessary connection—the passion of love.

* The Anatomy of the External Forms of Man, intended for the Use of Artists, Painters, and Sculptors. By Dr J. Fau. Edited, with Additions, by Robert Knox, M.D. With an Atlas of Twenty-Eight Plates. 4to. London: Baillière. 1849.

We cannot conceive how any person capable of appreciating high art can contemplate the masterpieces of the ancients with any reference to earthly passion, or look upon the beauty with which they are clothed as any other than a portion of the beauty with which God has clothed the universe—the beauty which marks it as his own, by the consanguinity there naturally exists between the master and his work. The educated and enlightened African may comprehend this beauty, but he will not love the less fondly his dusky wife and the dark imps she has given him. Among ourselves, the lover and his betrothed may gaze enraptured, and together, upon the Medicean Venus, but no thought will arise in the mind of either as to the possibility of a dangerous comparison being suggested between the woman and the goddess. It is possible, in the progress of ages, that as the population of the world becomes more and more intermixed, the style of beauty may approximate more and more to the Greek model; but in each passing age the various races and countries will be governed in their sympathies, as at present, by laws of their own. Thus in England the chiselled face may be an object of delight and admiration, but love will far more readily be inspired by the moulded features of the Anglo-Saxon physiognomy.

To conclude: ideal beauty is simply the highest beauty in nature; and although it may be comprehended intuitively by genius, we must approach it in ordinary circumstances through the cultivation of taste. In making this approach, we rise in general refinement and enlightenment; for nothing mean or base may draw near that divine presence. Governments would do well to understand this. They would do well to familiarise the million with the works in which beauty resides. They would do well, with views analogous to those of the Spartan matrons—who set up in their sleeping-rooms an Apollo, a Bacchus, a Nereus, or a Narcissus—to place as many of the masterpieces of art as they can collect before the people, to the end that they may bring forth great thoughts and noble deeds. L. R.

THE REJECTED HEIRESS.

It is a commonplace saying that truth is frequently more wonderful than fiction; and few persons who have lived long in the world are unprepared to admit this from their own experience or observation. Yet when one of these out-of-the-way episodes actually occurred in the retired village of Sunnyside, the good folks exclaimed, 'Well-a-day! who would have believed it possible?'

Old Mrs Armitage had succeeded to a large fortune; and the Witch of Sunnyside, as some called her, was whisked away from among them in a carriage-and-four, accompanied by a man of law, to take actual possession of a grand house, situated in a distant part of the country. This was one of those extraordinary windfalls which we sometimes read or hear of. Mrs Armitage had been advertised for, and proved to be nearest of kin to a deceased miser, of whom she had scarcely ever heard in her life. She was the widow of a petty government officer, and a trifling pension was all she had had to subsist upon—her only daughter, rather more than twenty years previously, having married a farmer about emigrating to the new world. All the neighbours pitied Farmer Smith for the burthen he had voluntarily imposed on himself—the burthen of such a wife as Ellen Armitage—who inherited from her mother the shrewish propensities and scolding tongue of a handsome Shaksperian Kate, though it seemed highly improbable that her gentle, submissive husband, would ever attempt to 'tame the shrew.' Moreover, Ellen Armitage had married against her mother's consent, and they parted in violent mutual anger, never to meet again in this world; for the first accounts that reached Mrs Armitage were, that the ship in which her daughter had embarked had foundered within sight of its distant destination, and nearly all on board were lost.

Amongst the passengers who perished were Mr and Mrs Smith. The mother's grief at first was extreme; for she remembered only the part she had acted towards her only child, without thinking of the part that child had acted towards her—for so it often is when death cancels wrongs.

Nevertheless, when her grief abated, Mrs Armitage was just the same as ever—notorious for her unkindly disposition and ungovernable temper. She dwelt in a small cottage on the outskirts of the village, where she had only two fine black cats for companions; and in former days it is very certain that this circumstance, coupled with her unsociable habits, might have aided the suspicions entertained against her as a dealer in forbidden arts. The young Mrs Armitage detested; the old she quarrelled with; and she had not a friend in Sunnyside, if we except little Rollo Lilligood, the shoemaker and cobbler. But who on earth could have disliked or quarrelled with Rollo?—the merriest, kindest, best, most single-hearted soul in the universe! He was the sole privileged visitor at Mrs Armitage's solitary cottage; he read to her on a Sabbath; he bore her animadversions and scoldings with unshaken fortitude and philanthropy; and though constantly ejected from the inhospitable roof with ungracious vituperations, he always found his way back again, meek and gentle, as if sure of a loving welcome. And Rollo Lilligood did all this because, he said, Mrs Armitage was to be pitied—that we ought to return good for evil, bear with one another, and visit the widows in their affliction. 'And was not an evil temper an affliction?' said Rollo. The worthy little shoemaker of Sunnyside was a widower; and though only about forty years of age himself, he had a son—his sole treasure—who was now in his nineteenth year. Rollo had married early and improvidently; but when he lost his young wife four years after their union, he looked upon her obscure grave, and felt that life was now a weary pilgrimage indeed. The village shoemaker mourned as sincerely for his lost love as any 'gentleman' of the land might do for his; and placing all his hopes on a future reunion, Rollo devoted himself to his calling, being thereby enabled, by unfailing diligence and perseverance, to give his son a decent education. The village schoolmaster was a man of good ability and judicious management; and young Rollo amply profited by both, inheriting some natural capacity and the blessing of a sweet disposition.

The attachment of this father and son was beyond that usually evinced even by such sacred and near relationship. Young Rollo resembled his lost mother in personal appearance—being tall, fair, and delicately formed, with a winsome countenance and a sunny smile. Many a village maiden looked after the handsome young cobbler with a sigh, for he was perfectly impervious to all their charms and allurements. Serious far beyond his years, thoughtful far beyond his station, caring only for books and rambles amid the beauties of nature when the day's work was ended, he neither frequented the dance, the revel, nor the alehouse, and yet gave offence to none: for Rollo was the most generous, brave, yet resolute and mild youth ever bent on having his own way. Young Rollo was a frequent visitor also at Mrs Armitage's; but his reception was even more equivocal than his father's. Mrs Armitage seemed to have a peculiar spite against the comely, as well as against the youthful, and taunted him about his 'love-locks' and 'book learning;' but Rollo patched the crabbled old lady's shoes gratuitously in return, fondled the cats, and oft-times trimmed up the neglected garden before the cottage.

There seemed little outward alteration in Mrs Armitage on hearing the astounding tidings which created such a sensation throughout the village; her black eyes twinkled more brightly, and she planted her stick more firmly when hobbling about; but when the neighbours dropped in—gathering courage from curiosity—she vouchsafed no information, and snappishly cut short all inquiries. Mr Temple, the lawyer, whose client Mrs

Armitage had now become, was, fortunately for the ignorant and foolish old woman, a man of the highest worth and probity; the affairs of the miser deceased were entirely in his hands; and the vast wealth passing over to Mrs Armitage was under his superintendence and jurisdiction. Mr Temple soon found that he had no easy matter to manage, for the old woman was self-willed and dictatorial in the extreme, and baffled all the lawyer's tact and prudence, in his endeavours to gain her confidence and good-will, by sharp and vulgar suspicions and retorts. But ere her departure for her new residence, Walmsley Hall, Mrs Armitage was made aware that she had it in her own power entirely to will away her wealth to whom she pleased. On hearing this from Mr Temple, she struck her staff violently on the ground, and compressed her lips, as if forming an unalterable resolution, at the same time requesting Mr Temple to keep the knowledge 'to himself.' When the chaise containing the lawyer and his client disappeared on the winding road above Sunnyside (which basked in a pleasant watered valley), there was not one left behind to lament the old woman's departure, or to rejoice in her singular good fortune, except the little shoemaker, Rollo Lilligood; and perhaps he felt somewhat as a doctor may do on the loss of a fractious patient. Mrs Armitage had spoken kinder words when saying 'adieu' to Rollo Lilligood than might have been expected from her general demeanour: 'I'll send you a good round order, neighbour, when I get to Walmsley; and you shan't patch and cobble for *nothing* now,' she screamed after the little man as he left the cottage, where for so many years he had ministered with patient Christian love.

Many months passed away, and the inhabitants of Sunnyside had almost forgotten Mrs Armitage and her singular history; the cottage she had inhabited was tenanted by tidy, cheerful-working folks, and no trace remained either in the aspect of the habitation or in the hearts of the villagers to recall the cross and disagreeable old woman to their memories. Rollo Lilligood had not received the promised order, and he *was* disappointed; for, truth to tell, the humble, disinterested creature had built some castles in the air—not for himself, but for his dear boy—the extent of his hopes being limited to perhaps receiving a present of books, or something of that sort, through Mr Temple's instrumentality, that gentleman having taken great notice of young Rollo when sojourning at the Sunnyside Arms.

But Rollo was a contented man, nevertheless, and he diligently attended to his business; settling in his own mind that prosperity had had the not unusual effect of making his former neighbour forget the associates of her poverty. But he was mistaken in his surmises, for Mrs Armitage, with all her unamiable qualities, yet retained a recollection of his kindness, and had speedily evinced that she did so by notifying to Mr Temple her desire of making Rollo *senior* her sole heir! The will was drawn out in due form, Mr Temple being handsomely remembered in it for his valuable services, and Rollo Lilligood, shoemaker of Sunnyside, appointed sole residuary legatee. Mrs Armitage determined that he should not be made acquainted with his good fortune during her lifetime—he must work, and his delicate son must work; but Rollo had been her only real friend, and she had no one else in the wide world to care 'one brass farthing for,' as she expressed it. Whatever were Mr Temple's feelings on the subject, he did not disclose them—his honour was chivalrous; and had the obstinate old dame selected *him* for her heir, he would probably, in the circumstances he stood in towards her, have scrupled to avail himself of the advantage.

Mr Temple had an ample private fortune besides his professional gains; he was a widower, with an only child (a fair and amiable daughter), and when he undertook the management of Mrs Armitage's affairs, no idea of self-aggrandisement entered his honest head. His client had a vast deal of low cunning—that kind of cunning which is often apt to look upon lawyers as over-

reaching and unscrupulous, simply because they *are* lawyers; and Mrs Armitage watched all Mr Temple's movements most narrowly, little thinking that her scrutiny was observed by him, and that he was greatly amused by this development of character, making much allowance for her ignorance and consequent prejudices. He felt glad that she had sufficient gratitude in her nature to propose rewarding the tried friend of former times; and when the worthy shoemaker's son came before his mind's eye, Mr Temple determined to interfere thus far—to leave no stone unturned in trying to persuade Mrs Armitage to enable this promising young man to prosecute his studies under competent tuition, so as eventually to fit him for adorning that station to which the wealth she proposed bequeathing his father must raise him. Mr Temple had a hard battle to fight. Mrs Armitage contended that Rollo *junior* was 'learned enough already'; she wanted no 'would-be gentleman' to succeed to the inheritance; and it was to *his father*, not to *him*, that she left it.

Still, Mr Temple persevered; and beneath the magical sway of his urbanity and good management, something almost resembling equanimity began to exhibit itself in his client's sour demeanour, while order and propriety reigned at Walmsley. Suddenly, however, all Mr Temple's plans were frustrated by the unexpected arrival of a stranger on the scene of action, whose credentials admitted of no dispute, and whose influence became all-predominant. In the meantime Rollo Lilligood, fortunately perhaps for his peace of mind, was wholly in the dark as to all these proceedings and arrangements in his favour, consequently disappointment reached him not; and when he received a letter desiring his immediate presence at Walmsley *alone*, he had no doubt that Mrs Armitage was on the point of death, and wished him to read those pleasant words of comfort from the Holy Book which he used to do on the quiet evenings and Sabbaths at Sunnyside.

Very much hurried and abashed was Rollo Lilligood, on arriving at the Hall, to find himself received as a guest in so grand a mansion, and to be ushered into a sitting-room instead of a kitchen. But far more hurried and flurried he was when he found himself in the presence of two females—one of them his old friend Mrs Armitage, looking healthy, and full of spirit and vigour. She was not dying, that was clear; but why he was sent for in such haste was *not* so. During the whole course of the evening no allusion was made to the motive for so sudden a summons; as far as regarded eating and drinking, Rollo was made most comfortable; but he was ill at ease notwithstanding, and the presence of the second unknown female added unaccountably to his tremors. Mrs Armitage had named her as her daughter Mrs Smith, supposed for many years to have perished by shipwreck, but providentially rescued, and turning up 'just in the nick of time,' added the dame laughing; but it was a hollow laugh, and made Rollo shudder.

Mrs Smith was apparently a woman of middle age, much sunburnt and weather-beaten, but, excepting a pair of large black eyes, by no means gentle in their expression, it was difficult to guess what her appearance might *once* have been, owing to the disfigurement of a deep scar or wound on her face, reaching across one cheek—full of wrinkles and seams in consequence. Her voice was harsh, her manner repulsive, yet she evidently tried her utmost to be pleasant, and to appear to the best advantage; but it was when she said 'mother' that Rollo started, for the word grated on his nerves; and when the old woman was irritable and peevish, 'Ellen' looked daggers, but *spoke* honied words. Mrs Smith's eyes followed all Rollo's movements with inquisitorial curiosity; she seemed to be reading his character, or endeavouring to do so; and he, worthy little soul, grew quite abashed beneath the unwonted scrutiny, and had not the courage to respond except by monosyllables. Next morning he was closeted with Mrs Armitage at her desire, and listened to an explanation

and strange recital; ending with her expressing a wish and making an avowal which caused Rollo Lilligood to recoil in amazement and dismay. The substance of the conversation on Mrs Armitage's part was this:—It was not Ellen and her husband who had perished in the wreck, but another Mr and Mrs Smith; Ellen had been left a widow in the new world, but managed her farm alone, as well or better than with her husband's help; and on seeing in the newspapers from England the wonderful account of her mother's inheritance of a large fortune, she had come home at once. Her long silence, her long neglect of her mother, she explained by assurances that she had really written, although the letters miscarried; but then receiving no answer, she had concluded her parent's anger unabated.

'I do assure you, Rollo Lilligood,' continued Mrs Armitage, 'that if Ellen had not brought the certificates of her marriage and birth which she took away with her, I should have hardly been able to identify my own child, for even twenty years could scarcely have altered her so much. The mole on her cheek, too, is destroyed, for that deep gash is right across it: it came from an accident, she says, in felling a tree. Mr Temple behaved very oddly I thought, and was not satisfied for a long time that Ellen was my daughter; till I told him that I *knew* she was so, from proofs indisputable, because she knew things that none save Ellen herself could know. After making a good deal of fuss, looking at the certificates, and what not, *he* was satisfied as well as myself; and Ellen soon told him that his absence would be better than his presence.' Here Mrs Armitage lowered her voice, and looked round with a timid air, which Rollo had never seen her display before: she continued almost in a whisper, 'I don't know how it is, Rollo Lilligood—perhaps I am going to die—but I don't feel like a mother to Ellen. When I thought my child was dead, I mourned and fretted desperately; but now she is restored to me, I don't feel the old love—for I did love her, though she offended me, Rollo.'

Mrs Armitage then, with much circumlocution, proceeded to prepare Rollo for the tidings she had to communicate, which were to the effect that she desired his marriage with her daughter, thereby securing to him the wealth she had already bequeathed. Rollo was not wanting in sense, and he immediately said with a smile, 'You mean kindly, Mrs Armitage, ma'am, I am sure; but do you think it likely that your daughter Mrs Smith, who *must* have your money anyhow of course, would take such a little ugly fellow as the Sunnyside shoemaker for her husband, when, with such a fortune, she might pick and choose?'

'She will take you, Rollo Lilligood,' answered Mrs Armitage: 'I told her my will was already made in your favour, and that I wished her to marry you. She is a good obedient child I must say for her in this respect; for before ever she saw you, she promised to do just as I liked. I wish you to be her husband, Rollo; you are a good, honest man; I wish you to have my wealth; I wish her to have it too; and though I must say I am astonished at Ellen agreeing to my proposal so easily, yet, as she has done so, all that remains for you is to ask her to marry you at once, when you are the master of Walmsley, and I shall die happy.'

'Mrs Armitage, ma'am,' answered Rollo decisively, 'if your daughter inherited all England, and all the palaces in it, I would not be her husband.'

It were needless to repeat the violent discussions on the part of Mrs Armitage—on the determined refusal on Rollo's: one thought, and one only, he gave to his beloved son; but the father felt sure that that dear son would never wish to purchase wealth at such a sacrifice on his part. To become *that* woman's husband! Impossible! thought Rollo. Other thoughts, which he buried in his inmost heart, also crept forward. His rejection was final and decisive. Mrs Armitage discarded him for ever—he should not have a stiver unless he married Ellen Smith! And Ellen herself, what said she on hearing that she was rejected by the shoemaker

of Sunnyside? She said nothing; but her look so thoroughly alarmed and petrified the nervous little man, that he took French-leave of Walmsley instantaneously, nor felt himself secure till he stood beneath his thatched roof once more with young Rollo beside him. The latter, on hearing the Arabian-Night like details, was at first serious and attentive; but when his father came to the proposal of marriage, and his terror of the lady, and rejection of the fortune and honour together, Rollo junior indulged in the loudest and longest laugh that he had ever known since his birth. His father's flight seemed to tickle his fancy immensely; but when they talked over the matter soberly, both father and son came to the same conclusion. What that conclusion was, they religiously kept to themselves, nor did either of them indulge a regret for the wealth thus lost when almost in their grasp.

'Rollo,' said the elder, 'that woman Ellen Smith is'— Here he paused.

'What, father?' said his son, looking on the pale speaker.

'A fiend in woman's form, or I am much mistaken. But we'll "bide our time;" and be thankful I have escaped, my son!' ejaculated poor Lilligood, heaving a deep sigh—a sigh of relief. 'And we will keep all these matters to ourselves, my dear boy; for it is women only who love gossiping, and you and I are wise men, though we be but poor cobblers.'

It was nearly twelve months subsequent to Rollo Lilligood's visit to Walmsley when, on a tranquil summer evening, an aged man, with venerable silvery locks flowing on his shoulders, arrived at the quiet village of Sunnyside. He was a missionary from distant lands, and the best years of his life had been devoted to the conversion of the heathen in the new world. Now worn out, he came home to die, and to rest his bones in the churchyard of Sunnyside beside his kindred. Rollo's deceased wife had been the aged man's grandniece, and Rollo was the only one of his family left with whom the pious labourer could claim affinity. In his society—shared by the whole village—the newspapers at the Sunnyside Arms were now neglected; and it is probable that the parties most interested might not have heard the tidings they conveyed, had not the landlord happened to glance his eye over them, and being aware of Rollo's visit to Walmsley, he bustled with the intelligence to his friend the worthy little shoemaker. The country-side rang with the horrible story—a daughter had been arrested on suspicion of attempting to poison her own mother, whom she had already almost killed by a course of ill usage. Fortunately the attempt had failed, but 'Ellen Smith' was in custody, and Mrs Armitage of Walmsley Hall was her intended victim. The article entered into further particulars concerning Mrs Armitage's succession to the fortune, her daughter's unexpected reappearance, &c. concluding with an explanation of the means through which the atrocity was discovered—two of the servants appearing as witnesses against Mrs Smith, who, it was known, was to inherit all her mother's wealth, the latter having made a will to that effect.

Much was said on all sides concerning the wickedness of the world in general; and the reverend missionary, who had caught part of the conversation, descanted amply on that subject. But when Rollo told him of his own deep interest in the particular 'wickedness' in question, Mr Peckham, with ready sympathy, requested to hear the full details. Accordingly, when they were alone, Mr Lilligood commenced his narrative, leaving nothing out from first to last except his former kindness to Mrs Armitage. Mr Peckham listened attentively; but when Rollo described Mrs Smith, he inquired with evident agitation from what part of the new world she had come. On Rollo informing him, the missionary solemnly said, 'Wonderful are the ways of the Lord, and how he maketh darkness light! My son, although my memory is failing me, yet I have at this moment a perfect recollection of being

sent for to pray by the sick-bed of a fellow-countryman; and in that distant land the ties of country are almost as strong as those of affinity. He was a farmer, of the name of Smith, a man of weak intellect, and his horror of approaching death almost forced upon me the conclusion that he had led a particularly sinful life. But this was not so, I found, for he had been more sinned against than sinning; and I endeavoured to lead him to the knowledge of our only refuge for the just as well as the unjust. He was closely attended upon by his wife. Now, mark me, Rollo; he told me she was his *second* wife; that she had been a servant to his first wife and himself for some years, but a convict before then. He called her "Eliza;" I am sure of that. I remember her brutal manner to the dying man, the gash on her cheek, and her dislike to my being left alone with her husband. It was only at intervals that Smith snatched a moment here and there to speak to me of his past life; for when she was by, he appeared cowed and terrified. The last time I ever saw him in life—his wife (who appeared unusually harsh even for her) being called away for a few minutes—he began lamenting his "ill-luck," as he termed it, in having been the husband of two such viragos; for, said he, "My dead wife, Ellen, threw a pruning-knife at *this* one, and gashed her cheek as you see. Ellen was a shrew, but not so bad as 'Liza neither. Ah, sir! if you ever go back to our dear native land, I wish you would find out poor Nelly's mother, and tell the old soul that her daughter named her kindly when she was dying, for they had quarrelled." I promised willingly to do so, if spared, and requested to know the name of Ellen's mother and her place of abode. "Her name is Armitage, and she lives at"—But here Mrs Smith's return stopped our conversation; and when I returned next evening to the farm, the husband was dead.

"Oh, my dear sir," exclaimed Rollo, "my prophetic instincts were not in vain; this is wonderful indeed! I will off to London at once, and find out Mr Temple."

"But Smith is a common name, my son," said the placid missionary, "and there is a possibility that there may be a mistake in our suppositions, though I confess the coincidence is startling."

"We will leave all to Mr Temple, uncle," exclaimed Rollo. And in two days' time he was in Mr Temple's office, and telling his wonderful story.

Mr Temple speedily confronted the accused, quietly saying, "So, Mrs Smith, you have duped us all, it seems; and as Eliza Smith, formerly the deceased Ellen Armitage's servant, you stand convicted of an attempt to poison the said Ellen's mother."

Quite as quietly, and with imperturbable boldness, Mrs Smith replied, "Well, I thought I should be found out some day, and that is the reason why I consented to marry that fool the shoemaker; for if he was lord of Walmsley, I should have been lady."

"Now, madam," said the lawyer, "I think it possible you may have to prepare for a second trip beyond seas. Your unhappy victim—poor old Mrs Armitage!—has, I believe, received her death, or at least its acceleration, at your hands?"

"If I had managed better," cried the violent woman, "she would have met with it ere this. Do you think I ever forget that her daughter Ellen *did this*?" pointing to her cheek, livid with rage. "Once I was handsome as herself—people said we were like twin sisters; but I saw her die: I took her place: but oh that I could be revenged in full!"

Mr Temple stayed to listen to no more ravings, but making his best speed to Walmsley, laid before the miserable Mrs Armitage the facts of the case, and through whose instrumentality they were brought to light.

Miserable no longer, but lightened of a heavy load, the poor creature cried, "Thank God for this, that she is not my child: the *old love* never came back to my heart: I told Rollo Lilligood so. Ellen, with all her faults, never would have used her old mother as this

woman has done. Poor Nelly!—poor Nelly! So she thought of her own mother when she was a-dying?"

But Mrs Armitage's days were numbered: her spirit was utterly crushed. And once more Rollo Lilligood came to visit her, and to read the words of consolation, which she would listen to from none but him. The second Mrs Smith was transported for life, after having made confession of her fraud and imputed crime. She said that an old English newspaper, containing the account of Mrs Armitage's singular good fortune, had accidentally fallen into her hands; the scheme occurred to her, and seemed so feasible and easy, that she entertained no doubt of being able to carry it out successfully.

In process of time Walmsley Hall was well filled with Rollo's grandchildren. These fair little darlings called Mr Temple also 'grandpapa;' for Rollo the second, now a rising barrister, had espoused Miss Temple: he made himself quite sure of not being rejected by his heiress ere he ventured to offer his hand.

A picture of the good missionary, Mr Peckham, hangs in the dining-room; opposite to which is a full-length of Mr Lilligood the elder, engaged in the business of his calling. 'For I am as proud of my father,' said Rollo, 'as I hope my sons will be of me; and may my descendants never suffer those pictures to be removed!'

They were to be seen at Walmsley Hall a few years ago—the owner, a great-grandson of Rollo, bearing a wonderful resemblance to the portraiture on the canvas, while in uprightness and kindness of heart the likeness is still more perfect.

CURIOSITIES OF ROGUERY.

AUCTION GANGS—'ESTABLISHED BUSINESS' SWINDLE.

Auction Gangs.—It would appear to an uninitiated observer that property of any description, which has been consigned to an auctioneer for disposal by public sale, which is submitted to public competition, and which can be sold only with the auctioneer's consent and complicity, is pretty sure of producing, if not something like its actual value in the commercial market, at least its value to the parties present at the sale, minus that fair retailer's profit which it ought to be the effect of general competition to reduce to its minimum amount. However reasonable such an expectation, nothing is more uncertain than its realisation in the numerous auction marts in the metropolis. There exists a system of wholesale theft and robbery so widely diffused, and so universally carried into execution, that it is impossible to form any estimate of the plunder, which must be enormous in its aggregate amount, and which forms the daily and hourly booty of a set of heartless and unprincipled harpies, who grow rich and fatten upon the domestic misfortunes of their fellow-men. By the operation of this nefarious system, the apparently fair and honest procedure of sale by public roup is utterly vitiated; and the auctioneer—who in a case of unreserved sale, such as that in which the property is adjudged to the hammer under a distress warrant, has no power either to protect the rights of the unfortunate owners, or to save himself from the degraded position he is forced to occupy—is made the unwilling tool of a set of scoundrels, to whom he is compelled to assign, one after another, articles frequently of high finish and sterling value, for sums paltry in the extreme, if not merely nominal.

Those who have noticed the rapid, almost sudden, growth and expansion of certain brokering chapmen and dealers in articles of furniture, pictures, musical instruments, curiosities, bronzes, vases, and objects of *verré*, must have been often struck with surprise at their miraculously speedy prosperity. The small front shop soon bursts into the back parlour; it then *creeps up* the

then the proprietor buys out his neighbours, and overflows first on one side, then on the other, with his fast-increasing stock, till at length half the street, or the whole of it, is one huge repository of everything domestic which necessity, luxury, or vanity can demand and industry supply. The course of knavery we are about to describe may serve to moderate the surprise of the observer.

Be it understood, then, that there exists a species of federal union, never talked about, yet open to all whose trade it is to buy by auction for purposes of retailing. The primary object of this union is, to suppress and prevent that competition which it is the purpose of public sale to elicit. As a general rule it may be affirmed that of this union every broker, dealer or buyer by trade, whose principle of integrity is not sufficiently strong to resist the temptation, is, tacitly at least, a member. And indeed, however honest a dealer may be, he is often compelled in self-defence to wink at the proceedings of the gang, even though he refrain from participating in their vile gains. We must not be supposed to infer that this iniquitous confederation is organised upon any regular system—that it boasts of any rules or written documents of any kind. Such a tangible embodiment of its principles would of course be fraught with peril to the parties concerned, and is therefore avoided. The phrase ‘honour among thieves’ expresses the sole law by which the proceedings of its numerous members are regulated; and though they often quarrel bitterly over the division of the spoil, and have been seen to fight furiously for their imagined rights, they are never known to have recourse to the law for protection. From all we can gather concerning the origin of this foul conspiracy—and we have taken some pains in the investigation—it would appear that it has been of slow and gradual growth, and that it was, in the first place, the spontaneous offspring of the cupidity and dishonesty of a very limited group of confederated rascals. It is affirmed—with what truth we know not—that it was first detected in operation among the Jews of a certain locality, and that it was immediately imitated on all sides, instead of being suppressed, as it might have been by the strong arm of the law and the force of public rebuke, had the infernal machinations of its members been made known. However this may be, it is pretty certain that since its first rise, which might be dated at less than a score of years back, it has spread like a pestilence to every part of the metropolis; and that, at the present moment, it cannot be predicated with absolute certainty of any auction-room situated between Knightsbridge west and Mile-end east, or Highgate north and Peckham south, that on any given day in the year there shall be a fair sale of any specified kind of portable property. If the *gang* be present—and they are always present if the property to be disposed of offers them any considerable advantage—they will be sure to accomplish two things: in the first place, they will get most of the lots they desiderate knocked down to them at a low bidding; and in the second place, they will prevent any stranger who is not a professional buyer from obtaining any article for a sum much less than double its value.

On a certain day in the year 1847—we do not choose, for certain reasons, to be more particular as to date—we attended a sale, where, among other valuable species of property, a pretty large collection of pictures was to be sold. Our object was to purchase a clever production of Fuseli's, should it fall within the limited range of our pocket. Being pressed for time, we had not leisure to change an old office coat in which we had sat all the morning, and consequently made our appearance at the saleroom in somewhat seedy trim—to which accidental circumstance may be doubtless attributed the revelation we have to make. It should be mentioned that the property was that of a defunct dealer, and that his widow was then in the house awaiting with anxious heart the result of the sale, upon the proceeds of which her prospect of future comfort depended. We found the rostrum of the auctioneer surrounded by the *auction gang*, among whom, all unconscious of their honourable fraternisation, we with considerable difficulty shouldered our way, and obtained a standing position in front of the

revolving easel upon which the paintings were then exhibiting to the crowd of bidders.

‘Are you in?’ said a greasy, grizzly-bearded face, reeking over our shoulder.

‘Yes, thank Heaven, we are in,’ said we, mistaking the purport of the question.

‘Oh, it’s all right,’ said the questioner, turning to those behind him: ‘he’s in.’

We need not detail the whole of the conversation we overheard—enough to say that we soon discovered something of the nature of the conspiracy, and saw its profitable but villanous operation in full swing. Most of the pictures of greatest value were knocked down at wretched prices to three or four members of the gang; and once when a stranger endeavoured to secure a piece of some merit, the biddings were run up against him to an amount far beyond its utmost value, until he ceased to bid, when the lot was knocked down to one of the gang, who immediately repudiated his bidding, and swore that he did not intend to bid more than a certain sum. After some squabbling, the lot was put up again, and bought by the gang against the stranger for far more than its worth. Once when we hazarded a bidding for the lot we came to purchase, we were stopped with, ‘Shut up, you fool; that’s —’s bidding: hold your mouth—you’ll get it for nothing if you want it at the knock-out.’

‘At the knock-out!’ we mentally ejaculated; ‘what upon earth is that?’ We had heard the expression before, though casually, and it had escaped our memory; but we resolved this time, if possible, to penetrate the mystery, and learn whether it really was what we already began to suspect it to be.

‘And where,’ said we in as careless a tone as we could assume, ‘does the knock-out come off this time?’

‘Oh, at the old place; at —’s back-room up stairs.’

‘What! C— Court?’ (This was a leading question, as we knew no one at C— Court.)

‘No; at W— Street.’

‘To-night of course?’

‘To be sure—half-past eight or nine.’

We did not fail, shortly before nine o’clock, to ascend the stairs to the back-room of the house indicated in W— Street. Before the hour had struck, the whole of the gang was present, and comprehended a much larger number than we had expected to meet. Among them we recognised several owners of first-rate shops, men of property and capital—one especially, who had recently portioned his daughter with thousands, along with others of *undoubted* respectability. Seating ourselves near the door, and calling for grog on the principle of doing at Rome as Romans do, we awaited with interest the result of the proceedings. A number of the smaller and more valuable paintings—gems of the Italian and Flemish schools—a few English specimens, and several finely-wrought vases and bronzes, had been already ‘cleared,’ and deposited in the old-fashioned window-recesses, and upon tables in the room. As it was now past the hour, and all were supposed to be present, the door was closed upon the ejected waiter, and the ‘knock-out,’ which, as we had suspected, was nothing more or less than the *real sale* of the property, commenced. An individual, whom we shall designate Smash, whose vampyre-looking physiognomy is too well known to the frequenters of certain salerooms, was the unlicensed auctioneer of the evening. Catalogues being produced, all the lots bought by the gang were gone over seriatim, and now for the first time put up to serious competition. One by one they were knocked down to eager purchasers at prices varying from double to ten times the sums for which they had been obtained but a few hours before. Cash was paid down for each lot as it was sold, and deposited in a small tray in front of the seller, the lots, or an order upon the auctioneer for such lots as had not been cleared, being delivered to the respective purchasers. When the whole of them had been disposed of, the mass of gold and silver in the tray had accumulated to a considerable size. Smash then resigning the hammer, reimbursed from the heap before him the parties who had cleared the lots present—those who had purchased lots yet in the custody

of the auctioneer having of course paid to the heap the difference only between the final biddings at the sham sale and the real one. These payments concluded, a considerable sum, the produce of that day's diabolical robbery of a forlorn and widowed woman, remained to be divided among the wretches who had thus successfully combined to plunder the helpless. When the sale was over, we could not help remarking that the whole of the property rested finally in the hands of three or four persons—Smash being one of them, as he had bid pretty freely, and consigned several good lots to himself. A few of the articles which had been run up to a high price, in opposition to parties who, not being in the gang, had presumed to bid against it, hardly realised half the sums they had cost; but the loss upon these was compensated tenfold by the gain upon the remainder. And now came the division of the spoil, which was eventually managed upon a principle too complex to be fathomed by a casual observer. We noticed, however, when Smash read over the schedule, which occupied some time in preparing, that the individuals who had paid most money were to receive the largest share; and that those who bought nothing, and most probably never intended to buy, were to be paid at a lower rate. We did not witness the final distribution of the cash. Having no desire to pollute our fingers by the touch of such ill-gotten gain, we feigned a sudden excuse for quitting the room; and requesting our grizzled friend to take charge 'for two minutes' of our untasted grog, we quitted in sovereign disgust this den of ill-doers, who wanted only the virtues of personal courage and outspoken sincerity to elevate them to the level of the burglar and the highwayman.

It is some years since we became thus aware of the existence of this atrocious system of plunder, and we have since frequently detected it in operation where we little expected to meet it. At book-sales it is a perfect nuisance. There are several scores of petty scoundrels who pass their lives at book-auctions, rarely bidding, and never buying if they can avoid it, and whose sole means of subsistence is this meanest of all possible modes of plunder. From inquiries we have cautiously made—for it is not an easy matter to obtain reliable information from the parties implicated—we are induced to believe that the majority of the real buyers would be glad to abate the practice, or put it down altogether, if possible. They find that where, as is generally the case with regard to books, the separate purchases are rarely of any great value, the trouble and inconvenience the practice entails are not compensated by the profit it affords: but the miserable wretches to whom such stolen scraps are daily bread, stick too hard upon their skirts to be readily got rid of.

It is a melancholy thing, and one that speaks volumes upon the demoralising effect of bargain-hunting upon the character, that among these plunderers of the weak, the friendless, and the prostrate in circumstances, should be numbered names of respectable standing in commerce—names well known and trusted among connoisseurs and collectors of works of art, relics of antiquity, or objects of vertu. But there is unhappily no margin left for doubt upon the subject. It would be in our power, on any given day, in the course of a few hours' visit to some of the finest collections of the first-class dealers in such matters in the metropolis, to pitch upon a score or two of valuable specimens which have come into the possession of the present owners through the scandalous medium of the 'knock-out.*' These men, be it remembered, have not the plea of necessity to advance in mitigation of their acts: they are surrounded with the materials and appliances of luxury, and have wealth at command, and might reason-

* We have this day seen a very valuable painting, bought by one of these gangs at a late sale of the property of a deceased proprietor, for a sum hardly covering the cost of the frame and the materials used in painting. What it realised at the 'knock-out,' and what was consequently the amount of plunder shared among the gang, we were not able to ascertain. One thing we can state with certainty, and that is, that the present custodian of the picture (it would be an abuse of language to call him the proprietor) demands above a thousand guineas for it; and, considering its rare quality and transcendent merit, seems not unlikely to obtain the sum he demands.

ably be expected to set an example of honesty in the pursuit of a profession which is sadly in want of it.

The 'Established Business' Swindle.—Just on the same principle as the American backwoodsman locates upon a plot of savage territory, fells the forest timber, burns the lumber, ploughs and sows the reclaimed land—then sells the whole clearing, stock, lot, and coming crop, to some wandering emigrant in search of a settlement—so in London there is a class of men (and, we may add, of women too) whose favourite occupation it is to open new shops, and dig out, as it were, new channels for the currents of commerce, in the yet untried neighbourhoods of the ever-increasing metropolis; selling their newly-formed establishments so soon as they are set a-going, and in a fair way of success, either to new-married couples, country immigrants, or other parties whom they may suit. Against such a mode of gaining a livelihood, however singular it may appear to some, nothing can be justly said. These parties are often of essential service to the community, to whom they frequently introduce the conveniences of retail trade in localities which, without their speculative enterprise, would long remain strangers to them. They are the pioneers of traffic, whose mission it is to clear the way for the commercial host which has in due time to follow in their footsteps. They owe their success (and most of them are successful) to the possession of a rare tact and discrimination in reference to business matters, as well as to a considerable amount of that constitutional energy and restlessness which so remarkably characterise their prototype of the 'far west.' But as everything successful in London is sure to give birth to its counterfeit, so in this peculiar walk of life there are hundreds of unprincipled knaves who make a prey of the stranger and the inexperienced by the sale, under lying pretences, of mock establishments, whose pretended returns have no existence save in the records of a set of plausible account-books, artfully made up for the purpose of defrauding the unwary.

We shall more effectually expose the *modus operandi* of this sort of swindlers by a brief recital of what actually occurred to a friend of our own who unhappily fell into their clutches, than by any formal description that could be given.

In the year 184-, Walter S— found himself, at the demise of his last surviving parent, under the necessity of seeking a livelihood. With youth, health, and a tolerably good education, and with £600 in his pocket, he left his native place, and came to London to prosecute his fortune. After pushing his inquiries in town for near three months, without finding anything to suit him, he began to turn his attention to the morning papers, and to con the advertisements with a degree of interest which can only be appreciated by those who have been in similar circumstances. At length, lured by the prospect of a good income in return for very moderate exertions, he applied personally at the office of a house-agent in Oxford Street, who had advertised his business for sale. The office was a sort of semi-shop on the ground-floor, at the west end of the street; and though bearing a remarkably neat and genteel appearance, had withal a somewhat worn and business aspect. This he thought looked well. Having made his purpose known to the single clerk, that functionary touched a bell, which brought out the principal from an inner chamber—a sober, rather sad-visaged, well-dressed individual, of about five-and-thirty, in deep mourning. Upon making known the object of his visit, and referring to the advertisement in the 'Times' of that morning, the advertiser demanded whether it was the intention of his visitor to purchase the business for himself, or was he merely making inquiries on behalf of another person? S— replied that he was acting solely on his own account, and that, if the business bore out the terms of the advertisement, it was his intention to make him an offer.

'I could easily satisfy you,' said the other, 'that this business would have justified me in employing much stronger terms of recommendation; but the fact is, that although I have doubled the returns since I bought it myself, I have no wish to recover more than the money I paid for it—the death of a relative having released me

from the further necessity of any business occupation at all. But I fear you are too late; I parted with a gentleman not an hour ago who has all but decided upon taking it. It is a pity you did not apply before: I cannot say anything decisive on it at present. Good-morning, sir.'

'Good-morning,' and S— had already reached the door, disappointment in his face, when the other cried, 'Stop; you may give me your address. It is possible the first applicant may not conclude the affair. It strikes me, from some remarks he let drop, that he may not have the cash at hand, in which case I will let you know the day after to-morrow. By the way, we may as well understand each other—you will allow me to ask you if you are prepared to pay cash down, or at what date, supposing we should do business together?'

'Why,' said S—, 'I had not resolved to offer you the exact amount you demand; but I will say this, that if, after full investigation of the business and returns, we should deal, it will be for cash.'

'In that case,' said the agent, 'you shall have the preference if the party who has just left does not conclude the purchase. Perhaps you will look in at eleven the day after to-morrow, and thus save time.'

S— promised he would do so punctually, and departed, not without hopes of becoming yet the proprietor of so snug a concern.

At eleven precisely on the day appointed S— opened the office door. The principal was standing at the desk in earnest, almost angry discussion with an elderly man of gentlemanly garb and manners. He nodded to the new-comer, and motioned to his clerk to show him into the private room, which was so situated that S— could not avoid hearing every syllable that was uttered in the office. He soon became aware that the stranger was the first applicant whose rivalry he had so much dreaded; and he heard with secret satisfaction, that though eagerly desirous of securing the business, he was not in a condition to pay down the required sum upon taking possession. He pleaded hard to be allowed to make a deposit of part of the purchase-money, by way of binding the bargain, offering three hundred pounds in cash, and the rest in bills of short date. This the agent would by no means allow, and upbraided him with having deceived him in that particular at their former interviews. The stranger retorted, and the discussion grew almost into a quarrel, both parties becoming less ceremonious as the dispute waxed warm. It ended at last in the agent bowing out his would-be successor, who departed muttering his dissatisfaction in no measured terms.

The coast was now clear for S—, with whom, after apologising for the warmth of his language to the stranger, and remarking that it was a singular coincidence that S— should have arrived just in time to witness their disagreement, an arrangement was entered into for examining the books and testing the present state of the business. References having been exchanged on both sides, that same afternoon the books of the last two years were gone over cursorily, but carefully, and checked with the annual audits, in a manner, and with a result, perfectly satisfactory to the incoming proprietor. During the examination two parties called and paid L.5 as per-centage on houses let by the agent. Before leaving the premises, at sunset, S— had agreed to spend the ensuing fortnight in the office, as well to test the average returns, as to learn the simple routine of management. The fortnight passed pleasantly enough. The books were left in the hands of S—, who conned them carefully, and never conceived the slightest suspicion of their genuineness. The clerk proved a rollicking out-spoken fellow, fond of cigars and bottled ale, and made no scruple of abusing his employer for not having raised his salary beyond a paltry hundred—affirmed that to his exertions and attention the success of the office was mainly due—and hoped that S—, on assuming the government, would have the liberality to do him justice. There was no lack of business during the period of probation. Parties dropped in with notices of houses and premises to let, for the registry and exhibition of which on the office show-boards they paid willingly, according to a liberal scale of charges. The

principal was absent for hours together every day, and once for two whole days, during which S— had the luck to let a mansion in a neighbouring square for L.180 a year—accompanied the incoming tenant in the examination of the premises, and received from the landlord 5 per cent. upon the first year's rent. In addition to this, business was transacted of a less important character, but which yet yielded a comfortable profit to the agent. As the fortnight drew to a close, it appeared plainly enough that the profits averaged altogether, after paying expenses, nearly L.10 a week; and S— began to think it was a pity that he had not struck the bargain before, and pocketed them himself. When the time was up, and the agent asked him if he was satisfied with what they were doing, and was disposed to conclude the affair, he was but too ready to do so; and the next day a lawyer was called in, an agreement drawn up in due form, and signed by both parties; L.450 was paid down by S—, and bills at short dates were given for L.150 more. The 'agreement for a lease' of the offices, and the landlord's receipts for rents, together with all books and documents connected with the business, were made over to the new purchaser; and before starting for the north to 'take possession of his newly-bequeathed property,' the agent secretly advised S— to get rid of the clerk. 'You will find that you can easily manage the whole affair yourself,' said he; 'and you may as well save the expense of such a fellow, who is likely to prove an annoyance to any one who does not know how to manage him as I do.' This recommendation proved in the result quite unnecessary. S— took up what he now considered his permanent quarters on the ensuing day, and hired a sleeping-room close by for the better convenience of business. But no clerk made his appearance. This did not at first trouble the new proprietor, who attributed his absence to some convivial irregularity, and felt pretty sure of his speedy return. Two, three, four days—a whole week passed, and no clerk—and what, alas, was a thousand times worse, not a single customer! S—, now a prey to awful suspicions of foul play, lived upon tenter-hooks. Another and another week elapsed; and though the stream of population rushed incessantly past the office door, there were hardly more signs of business in the deserted rooms within than in the silent mummy chamber of an Egyptian pyramid. At length, when nearly two months had passed away without the realisation of a single shilling, and S— had become gradually awake to the completeness of his victimisation, a stranger called with a demand for two quarters' rent, and threatened to seize it if it were not paid immediately. S— produced his receipts up to the last quarter, which proved to be mere fabrications, signed with a name the same in sound, but differing in spelling from that of the real landlord. From explanations that ensued, and from reference to neighbours, and to the inmates of the upper part of the house, the whole machinery of the abominable fraud, which had been brought to so successful an issue, was made fully apparent. The agent himself, the clerk, the 'prior applicant,' the customers, the gentleman who had taken the house in the square (which house, by the way, belonged to the landlord of that of which the office was a part, and was still unlet), the pretended landlord, who had paid the per-centage on letting—the very lawyer, or supposed lawyer, who had drawn up the agreement—all were partners or creatures of one swindling gang. The books were a set of documents cooked up for the purpose of delusion. Among the scores of notices exhibited on the show-boards, only one was genuine, and that one was in reference to the house in the square, which had been made to play so important a part in the swindle. The others, it is true, indicated houses, shops, and chambers which were actually to let; but they had been copied from similar announcements displayed in other parts of the city, without the sanction of the owners of the premises, and for the purpose of carrying out the fraud. As a termination to this villanous affair, poor S— was fain to evacuate the theatre of his delusion, resigning the furniture and fixtures in consideration of a discharge in full of the landlord's claims for rent, and

to recommence his researches in London for some career upon which he might enter with empty pockets and a little dear-bought experience.

The above is an 'ower true tale,' and is but one of a thousand which might be supplied from the private histories of multitudes who have fallen victims to conspiracies of the same class more or less extensive. Every recurring week brings to the metropolis adventurers from the country in search of a location in town, and desirous of investing their hardly-earned savings, or long-expected inheritance, in some established business, or fair speculation, which may offer to honest industry the prospect of competence and respectability. Such will do well to remember that the land-sharks are here on the look-out for their prey, which they will be prevented from gorging only by the exercise of the utmost vigilance and precaution on the part of their intended victims.

THE PHILOSOPHY OF BUN-EATING.

AN Englishman is considered, in foreign countries, as a sort of philosopher of every-day life. He is supposed to be cold, calm, self-possessed; to pass along the stage of the world with the imperturbable gravity of a Red Indian; to be able to stand up to be shot at, or even married, with the most solemn decorum; and to carry off even his blunders and simplicities with a lofty air of good faith which sets ridicule at defiance. Such is the Englishman as he is commonly represented, for instance, on the French stage; but, although we are by no means disposed to challenge the general resemblance, we conceive it to be a point of honour to admit that in one particular it is defective: it does not truly characterise the Englishman in the act of eating a bun in a pastry-cook's shop.

Every one who is accustomed to resort to such places for something to stay the appetite, which otherwise would rage or languish by dinner-time, must have observed the singular embarrassment betrayed by the customers. It is painful to detect the expedients they are obliged to have recourse to in order to carry off some portion of this awkwardness. One gentleman, fortunate in being near the door, scans curiously the crowd passing along the street, as if he were looking for some one whom he wished to see. Another, farther in, feels a profound interest in a lemonade advertisement hung over the counter, which he has read fifty times before in similar circumstances. A third finds something demanding careful attention in a row of sauce-bottles or preserve-jars on the opposite side of the shop, till, having at length finished his regale, he all at once revives to a sense of the utter worthlessness of his object, pays his bill hastily, and rushes out into the street, delighted to have escaped from so humiliating a position. Dashing young dogs who come in for a shrimp sandwich and a glass of sherry and lemonade, may carry off matters by a gay conversation with the nymph of the counter, whom they rally about the sparkle and effervescence of the beverage, which they wittily conceive to bear some resemblance to the female character. Young ladies, too—usually taking care to enter in pairs or groups—have it in their power, while they absorb their respective jellies, to keep up a colloquy among themselves, rushing into a critical discussion of the merits of the last new novel, or the last miracle of the Opera, or something else intensely abstract and irrelevant to the matter in hand. It is all very well with such fortunately-situated persons; but for the stranger, the unit—the Englishman—who comes in alone to allay a craving appetite, the situation is a trying one.

The pastry-cooks, for their own sakes, should look to it. If they wish to cultivate the stand-up line of consumption, they should get their shops furnished with

something better than lemonade advertisements and rows of pickle jars for the study of their customers. A continual stream of new pictures hung up in proper situations within gazing distance of the lunching public, would, we are convinced, prove an immense attraction. They should not be pictures of single figures or small groups which tell their story at once and away; they ought generally to contain a multitude of figures, and to carry out a somewhat elaborate narrative, as is the case with the works of Hogarth, Callot, and similar geniuses. Not one should be capable of complete perusal in less time than is necessary for the demolition of a common-sized bun. The necessity of a considerable number of such pictures, and of their frequent renewal, must be evident, for a gentleman would soon feel the awkwardness of appearing before the public as taking an ever-fresh interest in one or two particular works of art, however excellent, every day of his life. There must be at least a dozen, and these ought to be changed at least every two months. Many artists would be glad of the opportunity of exhibiting their pictures in this manner, and therefore there could be no great difficulty in effecting the desired alliance between the rival powers of pastry and art. We can even imagine picture-dealers glad to pay a rent to a fashionable bunnist for the privilege of hanging up their wares with prices affixed in such a situation. On this point, however, we do not profess to speak oracularly. All we aim at is, to impress the necessity of something being done for the relief of distressed bun-eaters.

ADDED BY ANOTHER CONTRIBUTOR.

The plan here suggested may be very good as a temporary expedient, but I believe that the only right and thorough remedy for the evil complained of is to be found, where the remedies of so many other things are looked for—in education and the progress of the national mind. We entertain a firm conviction that, with good management, the awkwardness itself will disappear by and by, and the Englishman will be able to eat his bun with all the nonchalance which distinguishes him in the other predicaments of life. Why should this not be so? What is there in a bun, philosophically speaking, which should not be as surmountable to an Englishman as to a Frenchman? In the meantime, however, the Frenchman has the advantage. Look at him, as he enters the shop, sweeping the counter with the severe and lofty glance of a connoisseur! Having made his selection, he goes deliberately to work. He divides his attention between his bun and the company, scrutinising each in turn. He does not stare, however, but look; he does not bolt, but munch; and it is easy to see, by the approving air with which, ever and anon, he turns his eyes upon the diminishing bun, that he is satisfied with the mental analysis he has formed of its composition. He finishes with a gentle sigh of content; smoothes his moustache with the gravity which this act demands, and invariably receives; pays his *trois sous* politely; draws on his gloves with deliberation; touches his hat to the lady of the counter with an *empressement* proportioned to the charms of her face or dress; poises his cane majestically; and walks slowly out into the street.

The cause of this national distinction is, that in England eating is a vulgar necessity, while in France it is a fine art. In the latter country it is associated even with ideas of the soft passion; for when a lover treats his mistress, it is always to something to eat. In the class lower than the gentry (if there are any lower classes in the French Republic), when the gallant walks out with his lady-love, he inveigles her tenderly into the restaur-

rant. If they have anything to drink, it is merely a little *vin ordinaire* and water, as an accompaniment to the fricassée. If the day be Sunday, which is the most probable day in the week, it is à *rigueur* that the promenade ends with a quadrille; and this likewise takes place in a restaurant, and a restaurant, too, à *cent couverts*, where the master, even when asked only for a little hot water, to sophisticate the English stranger's *petit verre*, summons his head cook by shouting in a voice of proud command—'Chef!'

With us, on the other hand, eating has no grace, elegance, or dignity—drinking taking its place as the first of social exercises. When promenaders of the same rank as those just mentioned go forth to enjoy themselves, *solus cum sola*, they may walk for miles and hours without any other refreshment than beer or spirits and water. If they break bread at all, it is merely a stale biscuit as an accompaniment to the drink. As for a sister signalling the visit of her brother, who resides in a neighbouring town, by preparing some miraculous piece of cookery for him, to be eaten in an arbour in the garden, with the children round the table—that is a scene we smile at as so like the mounseers! Last holiday we met a couple of Modern Athenians, male and female, going forth into the country for a day's pleasuring. They were genteelly dressed: the lady, more especially, was very lady-like—

* They both were young, and one was beautiful!

The gentleman, we saw, had prudently provided against the casualties of travel, for a quart bottle protruded undisguisedly from the breast of his handsome coat like a black nose-gay!

But look at honest Mr Bull as he goes into a tavern to refresh the inner man, and tell us whether you detect any of the awkwardness you have just witnessed at the pastry-cook's? He surveys the room with the air of a monarch. He establishes himself with quiet majesty in his seat; he sips deliberately, critically, and perseveringly; and looks the world in the face the while like a man conscious of the performance of a meritorious action. Does not this show that Mr Bull has the pluck in him, if it were only properly directed? Are we too sanguine in thinking that the day will come in the progress of this onward-moving age, when he will be able to dispense with pictures at the pastry-cook's? Is there anything wild or visionary in supposing—as we do—that by and by, when called upon to perform publicly the munching of a bun, he will acquit himself with the philosophic calmness he exhibits in the other exigencies of social life?

AN EASTERN INTERIOR.

THE late Mr Charles Heath persisted for about a dozen years in sending an author and an artist to rummage continental Europe for materials, literary and scenic, for one of his splendid annual volumes. One great difficulty was, that the author and artist, having other matters to attend to at home, could not make it convenient to travel together; but even if it had happened otherwise, it is hardly probable that two men of different characters and professions could have seen the same objects with the same feelings, so as to give the requisite harmony to the descriptions of the pen and the pencil. Here is a volume, however, equal in interest as well as appearance to any of the bygone annuals, and written and illustrated by a single individual, skilful to the same degree and in the same way, both as an author and an artist.* Mr Bartlett would have been a

treasure to Mr Heath, and his saving of treasure even in travelling expenses might have prolonged for many years the prosperity of the 'Picturesque Annual.'

The 'Nile-Boat' is one of the most agreeable of all literary picture-books. Its information, though not new, is well selected, and conveyed in a way that gives it the value of novelty; while a brief historical introduction enables the reader to understand the subject without the trouble of study. In short, whether as regards the literature, or the numerous pictorial illustrations, this is emphatically a drawing-room book, and presents an excellent specimen of those intellectual luxuries of the age which are now brought within the reach of families of very moderate means.

We have said that the information conveyed by the book is not new; but this must not be rigidly understood. The author himself, indeed, disavows all claim to originality; but in point of fact the work is a volume of travels, and written by one too intelligent and experienced to follow blindly in the steps of his predecessors. There is, more especially, an 'interior,' as the artists say, which forms a very novel as well as agreeable picture. We have been told much of the difficulty, and, till very recent times, of the danger of a European gentleman visiting the harem of a Mohammedan; but a revolution would now appear to have taken place in Oriental manners, of which Mr Bartlett has been among the first to experience the advantage.

'My visit,' says he, 'had fallen on good, and not on evil times—upon an era of change indeed remarkable and momentous, not only for its immediate, but for its far-stretching consequences, and distinguished for the first insertion into the old Mussulman fabric of the wedge of European civilisation. The Turkish power was broken; the Egyptian flag waved upon the walls of Damascus; planted there, too, far less by the brute valour of the troops of Mehemet Ali, than by the tactics of those French generals (an ominous circumstance, and well deserving the closest attention of our statesmen) who had originally formed, and who in reality commanded them.

'When the rapid victories of Ibrahim Pasha had made him master of Syria, and given him the sudden possession of Damascus, and when he came to establish there his impartial system of administration, by which the Christians could no more (as by immemorial usage had been their lot) be trampled upon by the haughty Mussulmen, it was deemed a fit season to establish, if possible, an English consulate in so important a station. After much opposition, Mr Farren at length entered upon this post with every mark of honour from the local authorities, and by his conciliatory manners, soon contrived to render himself extremely popular among the higher classes. Still, the state of Syria was uncertain and convulsed; a reverse of the pasha's success would bring back into fierce reaction all the Mussulman intolerance; and sudden reprisals on the Christians were apprehended, in whose fate Europeans would naturally be involved. They were thus in a constant state of jeopardy; and although the consul had a town-house, he lived in the suburb of Salaheyih, whence, in case of a popular outbreak, he might easily make good his escape to the mountains. The day after my arrival we visited the city. As our horses clattered through the narrow streets, the crowd sullenly made way for us, and curses, not loud, but deep, were no doubt muttered in the choicest Arabic. Many a filthy dervish, pale with suppressed hate, looked daggers as we passed him by.'

* The Nile Boat; or Glimpses of the Land of Egypt. By W. H. Bartlett, author of 'Forty Days in the Desert.' London: Arthur Hall, Virtue, and Co. 1849.

There was not much to hope for, it might appear, from this state of affairs; but our author found that while the prejudices of the lower ranks seemed to have increased, those of the upper had sustained a change in an opposite direction. 'While such was the sullen fanaticism of the populace, only restrained by the arms of Ibrahim, another spirit was gaining ground among certain of the higher classes. The notorious indifference of the pasha himself to the Moslem institutes, and the liberalism of his European officers, which had infected also the native ones, began to influence certain of the Mussulman aristocracy; and, as extremes commonly meet, while the populace were ready to tear to pieces the Giaours who dared to insult their streets in the odious hat and European dress, some of the higher illuminati took a secret pleasure in showing their emancipation from the prejudices of their forefathers. Of this class principally were the visitors to the consul's house. I was on one occasion engaged in drawing the costume of a native female servant, when a man of some distinction entered—a Moollah of high descent, claiming as his ancestor no less a personage than the father of Ayesha, the favourite wife of the prophet himself. His demeanour was exceedingly grave and dignified, and, as I afterwards remarked, he was saluted in the streets with singular respect. His amusement was extremely great as he saw the girl's figure rapidly transferred to paper; he smiled from time to time, as if occupied with some pleasant idea, of which at length he delivered himself, expressing his wish, to our infinite surprise, that I should come to his house in company with the consul, and take a drawing of his favourite wife.'

This extraordinary invitation occasioned of course great expectation and excitement, and the tryst was anxiously kept. 'At the appointed hour we repaired to the old Moollah's abode. Externally, unlike the houses of Cairo, it presented nothing but a long dark wall upon the side of a narrow dusty lane; within, however, everything bore testimony to the wealth and luxury of its owner. The saloon into which we were ushered was spacious and splendid, marble-paved, with a bubbling fountain in the midst, and a roof supported on wooden beams, highly enriched, and gilt in the arabesque fashion. A large door, across which was slung a heavy leathern curtain, which could be unclosed and shut at pleasure, similar to those adopted in Catholic churches in Italy, opened on the court, from which another communicated with the mysterious apartments of the harem. We seated ourselves on the divan: our host shortly entered, smiling at his own thoughts as before; he doffed his turban and pelisse, retaining only his red cap and silk jacket; he rubbed his hands continually, his eyes twinkled, and he seemed to abandon himself entirely to the merry humour of the moment. A few words had hardly passed before the curtain was gently pushed aside; the lady, like a timid fawn, peeped in, then closing the curtain, advanced a few steps into the room, watching the eye of her husband, who, without rising, half laughing, yet half commanding, beckoned her to a seat on the divan, while we, our hands on our bosoms in the Oriental fashion, bent respectfully as she came forward and placed herself between the old Moollah and Mr Farren. Speaking Arabic well, the latter was enabled to commence a conversation, in which, after some slight hesitation at this first introduction to mixed society, the lady appeared to bear her part with much ease and vivacity. This delighted her husband, who could hardly help expressing his satisfaction by laughing outright, so proud was he of the talents of his wife, and so tickled with the novelty of the whole affair.'

In an Eastern harem, however, there are usually more than one lady of the house; and the reader is doubtless impatient to know what has become of the other members of the family. 'While this was going forward, I observed that the curtain of the door was drawn aside by a white hand, but so gently, as not at first to attract the attention of the Moollah (who sat with his back towards it), and a very lovely face,

with all the excitement of trembling curiosity in its laughing black eyes, peered into the apartment; then another, and another, till some half-dozen were looking over one another's shoulders, furtively glancing at the Giaours in the most earnest silence, and peeping edgewise at the old fellow to see if they were noticed; but he either was, or affected to be, unconscious of their presence, while the consul and myself maintained the severest gravity of aspect. Emboldened by this impunity, and provoked by the ludicrous seriousness of our visages, they began to criticise the Giaours freely, tittering, whispering, and comparing notes so loudly, that the noise attracted the attention of the old man, who turned round his head, when the curtain instantly popped to, and all again was silent. But ere long, these lively children of a larger growth, impelled by irresistible curiosity, returned again to their station: their remarks were now hardly restrained within a whisper, and they chattered and laughed with a total defiance of decorum. The favourite bit her lips, and looked every inch a sultana at this intolerable presumption; whereupon the old man gravely arose, and drove them back into the harem, as some old pedagogue would a bevy of noisy romps. Delivered from this interruption, the lady, at a sign from her liege lord, proceeded to assume the pose required for the drawing. She had assumed for this occasion her richest adornments: her oval head-dress was of mingled flowers and pearls; her long, closely-fitting robe, open at the sleeves and half way down the figure, was of striped silk; a splendid shawl was wreathed gracefully around the loins, and a rich short jacket was thrown over the rest of her attire; her feet were thrust into embroidered slippers, but the elegance of her gait was impaired by her walking on a sort of large ornamented pattens some inches from the ground. It may be supposed I did not keep the lady standing longer than was absolutely necessary. When I had finished, our host, with a smile of peculiar significance, directed her attention to a small carved cupboard, or cabinet, ornamented with pearl, from which she proceeded to draw forth—*mirabile dictu!*—a glass vessel containing that particular liquor forbidden to the faithful; and pouring it out in glasses, handed it to us all; then, at her husband's suggestion, helped herself; and as we pledged one another, the exhilaration of our pious Mussulman entertainer seemed to know no bounds. At the loud clapping of hands, a female slave had entered with a large tray covered with the choicest delicacies of Arab cookery—chopped meat rolled up in the leaves of vegetables, and other and more *recherché* dishes of exquisite piquancy of flavour; this was placed before us on a small stool, together with spoons for our especial use. To complete our entertainment, we were favoured with a specimen of the talents of an Almech, or singing-woman, confounded by so many travellers with the Ghawazee, or dancing-girls. In long low strains she began to chant a lugubrious romance, probably some tale of hapless love and wo. Her monotonous cadences would have driven Hotspur mad; worse than

"To hear a brazen can'tick turned,
Or a dry wheel grate on an axletree;"

but as the story proceeded, the lady appeared rapt, the tears filled her eyes, and she exhibited every sign of the deepest emotion; so different are the modes by which the same universal feelings may be affected.'

Such was Mr Bartlett's peep into an Eastern interior, and it will be admitted that it represents the whole *ménage* in rather an interesting light. What seemed specially odd to him was, that the favourite wife was by no means equal to the others in those personal charms which are supposed to be all-important with an Oriental. It proved, however, from the information received from the Moollah, that among the Mussulmans, as elsewhere, talent takes the precedence of mere beauty. The hostess *par excellence* was the only individual among them on whom her husband could rely for the invention of amusements to fill up the otherwise dreary monotony

of hours that must be passed without intellectual companionship. She alone could converse with him; and she, therefore, was the *wife* in the only rational meaning of the word.

LONDON GOSSIP.

'HOMAGE to the mercantile genius of Great Britain!' thus exclaims a French writer in a recently-published article on the export provision trade from the channel ports of France. 'Cargoes of apples were ready to be shipped for London, when orders came to pack them all in chests of uniform dimensions. So, with seven boards, a stroke of the saw, a few nails, and sundry hammer blows, chest after chest was made; and the stowage on board became as rapid as regular. In all this there is nothing that strikes you as beyond the comprehension of continental apple merchants. But John Bull has ordered his fruit-boxes of such dimensions as are required for a corpse of average stature. No sooner are they emptied, than he hands them over to the undertaker; the latter shapes them, makes the old nails serve again; and 300 per cent. is gained in the matter of cheap funerals. Provisions from all parts of the coast are now forwarded under this ingenious envelop, and each season of the year bears to the consumers of London its tribute of eatables and of dead-boxes.'

One would almost fancy this a compliment paid to some of Sam Slick's clever compatriots, rather than to the plodding and unimaginative race who respire under the shadow of the British lion. But it is true, nevertheless, as I have seen with my own eyes; and as the relaxed tariff brings us thousands of rabbits and heaps of cherries from Ostend, tons of butter and cheese from Rotterdam, millions of eggs and bushels of apples from Dunkirk, so there is no lack of coffin-wood to be put underground, and dug up again a few months afterwards by enterprising sextons for firewood. And in this way, as you see, the business connects itself with the question of burial in towns; and this must not be dismissed without a word or two on the Report just issued by the Board of Health 'On a General Scheme for Extramural Sepulture.' This document contains 172 pages, with a map, the latter showing the relative positions of the several metropolitan cemeteries, and indicating some of the remedial projects. The evidence on which the Report is based is similar to what has been before given; no one dreams now of disputing it, except here and there a sprinkling of obtuse entities. The pith lies in a small compass. 'There are,' say the Board, 'in London, situated at various distances from each other, and each differing in extent, 200 centres of more or less pollution, each pouring off unceasingly, day and night, its respective contribution of decaying matter; but the whole together, reckoning only the gases from decomposing human remains, amounting, as we have seen, in one year, to upwards of two millions and a-half of cubic feet.' So much of this deleterious gas remains to be inhaled, that the Board 'submit, therefore, that a case is made out for the total prohibition of interment in the metropolis, on account of the injury resulting from the practice to the public health.' This brings us to the conclusion, that 'if interment in the metropolis is to be wholly discontinued, provision must be made for the removal of 52,000 corpses a year, or of 1000 a week and upwards, to considerable distances from the places at which the deaths occur. Provision must also be made for the decent, orderly, and impressive interment of this number of the dead.'

The Board are entirely of opinion that the present system of funerals, where the undertakers' cry is, 'first come, first served,' should also be suppressed, and the whole management intrusted to one responsible commission of five members, of whom one to be paid. Then it is recommended that it shall be declared 'unlawful to inter in any other place than the public burial-grounds within the prescribed precincts;' 'that the chief metro-

politan cemetery should be in some eligible situation, accessible by water-carriage;' 'that it be unlawful to inter in any burial-ground more than one corpse in one grave;' 'that the price of funerals be regulated according to a series of scales or classes; and that the whole expense of each funeral be included in the charge fixed for its class, and be paid for in one sum.' A most eligible spot (said to be at Erith) is pointed out for the chief cemetery. It is on a dry sandy soil, and can be readily approached by railway or steamboat. Then, to insure speedy removal of corpses from dwelling-houses, it is proposed that 'reception-houses' should be built on both sides of the river, so as to include the parishes from Wandsworth down to Deptford and Blackwall. In these houses the bodies would lie under proper care until the time fixed on for burial. Of course there are details about hearses, coaches, funeral-steamboats, &c. and compensation to the clergy and others who may be exposed to loss by the change. One result of it would be to prevent infanticide, which prevails to some extent under the present system; as infants said to be 'still-born' are buried under cover of night, 'and no questions asked.' The new project presupposes a stringent registration of all births, whether dead or alive; and devoutly is it to be wished that parliament will give the measure the authority of law.

I don't like taking up your time with these sanitary matters, of which you must be well-nigh weary; but so much depends on them, that it is not easy to forbear; and there is a part of the subject which has generally escaped without due attention. It is that of the cow-yards, or 'dairies,' as they are called, so numerous in London. Each one of these is a Smithfield in miniature, a focus of noxious exhalations in quarters where you would least expect it, from courtly St James's to Bethnal Green. Mr Rugg, a surgeon, has lately published 'Observations on London Milk,' and traces many of the evils which afflict poor metropolitan humanity to the adulteration of that essential aliment. What would you think of keeping cows in underground vaults constantly lighted with gas? Yet such is the case. No wonder that London milk is said to give people consumption. Cowhouses generally are dark and ill-ventilated; the insufferable odour of a London dairy is but too well known—a compound of animal and vegetable effluvia of the most noisome kind, with the sour smell of distillers' wash. The adulterating substances are whiting, flour, starch, treacle, annatto, sugar of lead, and brains. Mr Rugg says—'When they (the dairy-keepers) cannot procure sheep's brains, they get those of the ox or cow, and others even from those hotbeds of disease—the knackers' yards. The way they use them for this detestable purpose is by rubbing them up with their hands (which are not the cleanest one would wish to see) with some warm water, and a white, milky-looking emulsion is the result. This is stirred up with the quantity of water which they intend to add to the milk.' This account is enough to make one forswear milk for ever. It appears that the process was imported from Paris, where, as well as in London, rich and luscious cream is prepared in the way here described. The bringing of milk by railway, which now prevails so largely, ought to have the effect of checking this evil. The price paid to country graziers by the town dealers is twopence or twopence-farthing per quart; they retail it at fourpence; so that, when the adulterating diluent is considered, their profit is enormous. I met a farmer in Berkshire lately who sends milk to London daily by the South-Western Railway; he told me that the charge for carriage was ninepence a hundredweight, and that he had opened a retail dairy in Leicester Square. On my asking him whether he put water into his milk, his reply was, 'I am obliged to do it, because if I didn't, it wouldn't be fair to the other dealers;' so that *unfairness* to the consumer appears to be no part of the question. Mr Rugg proposes to 'register' every milk supplier 'in town or country;' whereby, 'taking London to contain 2,000,000 inhabitants, and supposing

each individual to consume, on an average, half a pint of milk per day, it would require 50,000 cows, producing ten quarts per day each, to maintain the supply of 500,000 quarts per day, or 182,500,000 quarts per year; the rate on the 50,000 cows, at 2s. 6d. per head, would amount, independent of the registrations of the sheds and retail dealers, to L.6250 per annum.' Interference with trade is always objectionable, but it is a question whether some attempt might not be made to put an end to this system of fraud by appointing government inspectors of milk as they have in Holland.

Craving your indulgence for enlarging on this grievance, I pass now to the Astronomer-Royal's lecture at the Royal Institution on the 15th. The subject was terrestrial magnetism, and most luminously was it discussed. It would indeed be hard to find a lecturer to match Mr Airy in this respect; he makes the matter so clear, that it is your own fault if you do not understand it. He showed the present state and prospects of magnetism as a science, defining science to mean, not a knowledge of facts, but a knowledge of the causes—especially the mechanical causes—of observed phenomena; and commented on the simultaneous movements of magnets at observatories widely separated—at the foot of the Ural Mountains, at Greenwich, in Van Diemen's Land; and on the various theories of Hansteen, Gauss, and others, by which the different phenomena are to some extent accounted for. Mr Airy considers that no more expeditions for magnetic observation are necessary; that we have a sufficient collection of facts; and that the most likely means to arrive at a knowledge of causes would be to take any one of the sudden disturbances which occur in the movements of the magnets, and endeavour to trace it to its source, to find out its starting-point, and thus by a tentative process discover what is now so great a mystery. Here terrestrial magnetism rests for the present: the attempts hitherto made to reduce its extraordinary effects to distinctness of form and order, reflect the highest credit on all concerned, and the ascertaining of its causes will be one of the most startling and pregnant discoveries that could well be made.

Among miscellaneous matters is the invention of an 'Air Screamer,' to be fitted in ships, for use as signals in foggy weather, and thereby avoid those fatal catastrophes of running down at sea, one or two appalling cases of which, as you will remember, occurred last year. This instrument can be heard at a distance of four miles. Besides this, it is said that red glass is eminently serviceable in enabling a gazer to make out distant objects in a fog, and may thus become available in the prevention of accidents. The statements on this point require further testing; the explanation offered is, that the bright or white light of fog which wearies the eye, is relieved and neutralised by the coloured glass, so that the full power of sight remains for the examination of what is remote. The North Kent Railway Company are building carriages which will contain ninety-six passengers; according to theory, large vehicles can be moved with less expenditure of power than small ones. It is to be hoped that the comfort of passengers will not be lost sight of; for on some of our lines the space allowed between the seats is so cramping and confining, that it is a misery to travel on them. Your north of Tweed carriages are more conveniently constructed in this respect—in those on French lines you can sit with some degree of comfort. Besides these domestic items, there are two or three from the United States: a railway suspension-bridge over the Niagara river close to the Falls; it is to be hung on 16 cables, of 6000 wires each, laid straight, and 'served,' as sailors say, with thinner wire. The supports will be stone piers, and the structure, when completed, is to carry 6000 tons without flinching. Jonathan will then have something to boast of, as well as we of our Britannia Bridge. Next: the great national hero Washington is to be commemorated in a granite and marble monument, to be erected at Richmond in Virginia, for which

the state legislature has voted 100,000 dollars. Besides this, there is the elaborate and costly monument to the same personage now being erected at the central seat of government—Washington. Good opportunities for transatlantic sculptors: meantime chisellers here talk about them, and wonder what they will look like. And last; rumour is again busy with a discovery said to have been made in New York—that of producing light and heat by the decomposition of water at so trifling an expense, that the cost of warming a house would amount to less per week than to supply its mistress with gloves. I would not advise the English public to give credence to this rumour just yet.

Further accounts have come from Africa of the lake which I have already mentioned as discovered by Mr Moffat junior and some hunters. It is situated in longitude 24 degrees east, and latitude 19 degrees south, and its limits appear to have been undiscernible. According to the natives, however, it takes twenty-five days to travel round it. The vegetation on its banks is tropical, and palms are abundant, but it contains no crocodiles, alligators, or hippopotami. It is approached by a river, which for some distance is of small size, and which, as it nears the lake, becomes as large as the Clyde. There are no islands, except at the mouth of the river, and these are thickly inhabited by a race differing from those on the mainland. Fish is said to be abundant, pelicans also, and a breed of small elephants. Will it be safe to predict that steamboats will be running on this lake before ten years are over, and emigrants busily cultivating its shores?

Among other scientific gossip is the report presented to the Académie by three French chemists on the existence of lead, copper, and silver in sea-water, though in very minute quantities. They find the latter metal also in vegetable tissues; and being desirous to know whether vegetables of the ancient world contained a similar proportion, they experimented on coal, and came to the conclusion that its presence is most clearly demonstrated in modern vegetables. From plants they went to animals, and detected silver in the blood of oxen. Professor Unger, of the university of Vienna, has published 'Physionomic Pictures of the Vegetation of Different Periods of the Primitive World.' This is 'not a series of systematic tableaux, but real landscapes of great beauty, in which regard is had to all the known and presumed circumstances in relation with the subject; due attention is paid to the species of vegetables, to the atmospheric and climatologic conditions, and to the character of the lands and seas of ancient periods, as well as to the terrestrial and marine animals of each epoch.' Such a work as this, passing from the chiaroscuro of the carboniferous period through all the changes up to the tertiary, will be acceptable to general as well as scientific readers; especially to those who are best instructed by the eye.

But I must hasten to a conclusion, or I shall exceed my limit. Another poet has spoken, and we have new poems by Robert Browning, a writer less popularly known than he deserves to be. Tourists, who will begin to be on the alert with the advent of spring, will be gratified to know that the repairs at Caernarvon Castle are complete, and that several others of our favourite Welsh ruins are to be similarly restored at the royal charge. Visitors to London, too, will learn with pleasure that a talk is again brewing about the obnoxious high prices for viewing St Paul's. And apropos of visitors—working-men's clubs are being formed in some of the provincial towns, to raise subscriptions for a trip to town in 1851 to see the much-talked-of National Exhibition—a very praiseworthy project. Not less noticeable are the 'Penny-Banks.' In the one at Hull, 5541 depositors lodged pence in the bank to the amount of above L.1200 in 182 days; at Greenock, too, there has been equal success. Artisans and operatives could not lay out a portion of their savings better than in travelling a little, and so enlarge their knowledge and experience. And here a passage

so much to the point occurs to me, that I quote for the winding up: it is taken from the recently-published reports of Mr Airy's lectures on astronomy at the Ipswich Museum. The lecturer had arranged that 'persons concerned in the mechanical operations of the town' should be present; and he especially invited the attention of working-men to his remarks, stating that 'the subjects of the lectures would not be beyond any working-man's comprehension. Everybody who has examined the history of persons concerned in the various branches of science has been enabled to learn, that whereas, on the one hand, those who are commonly called philosophers may be as narrow-minded as any other class, and as little informed; so, on the other hand, those who have to gain their daily livelihood by handicraft, may associate their trades or businesses, whatever they may be, with accomplishments of the most perfect and the most elevated kind.'

THE SENSES AND THE IMAGINATION.

It was about this time that coffee began to be generally introduced. Instead of adopting the new beverage, Mr Chalmers invented one of his own—an infusion of burnt rye—which he not only used constantly himself, but urged upon all his guests, strenuously affirming its equality with the best Mocha coffee. Upon one occasion, at Kilmany, Mr Duncan, who had no great relish for his friend's beverage, so stoutly denied this position, that Mr Chalmers declared that the next time he came to Dundee he would subject the matter, in Mr Duncan's own presence, to an *experimentum crucis*, and triumphantly vindicate his own invention. The time for the experiment soon arrived. Mr Chalmers appeared in Dundee, bringing with him a quantity of rye coffee, as he called it, of his best manufacture. The trial between it and its rival was made at Dr Ramsay's, to whose sister the performance of the important experiment had been committed. It was agreed that a select company of connoisseurs should assemble; that Miss Ramsay should furnish each, first with a cup of her best Mocha coffee, and then with a cup of 'the genuine Kilmany;' that each guest should announce his opinion, and that by the verdict of the majority the question of their respective merits should be decided. In the meantime, however, before the trial commenced, Miss Ramsay received certain private instructions, upon which she acted. In due time the company assembled. The coffee being handed round, met with general approbation. The second cup was next presented; by one after another an adverse verdict was pronounced, till it came at last to Mr Duncan, who emphatically exclaimed, 'Much inferior, *very much inferior!*' Mr Chalmers burst into laughter as he replied, 'It's your own Mocha coffee; the second cup is just the same article as the first.'—*Memoirs of Dr Chalmers.*

STRANGE TASTE IN ANIMALS.

It is singular to find, that while in animals each peculiar species has its distinguishing characteristic—as speed in the greyhound, courage in the bulldog, intelligence in the shepherd's colley, and acuteness in the Highland terrier—that there are now and again strange aberrations met with in their tastes, and such as are totally opposed also to natural habits and dispositions. I had a French poodle which would drink grog until he got drunk; but in his latter days he became reformed, for a stupid scoundrel gave Philip a glass of undiluted whisky, scalded his mouth, and from that moment he turned a teetotaler. In 1799, at the Angel Inn at Felton, the landlord had domesticated a hedgehog so completely, that he came when he was called 'Tom,' and made an excellent turnspit. Forty years ago, when Mr Allgood hunted the Tindale country, a guinea-hen, which had lost her partner, took to fox-hunting to kill grief. She regularly went to a field with the pack, kept a respectable place throughout the day, and always was in at the finish. It was believed that a conjugal bereavement, such as generally drive widows to the altar again, influenced the sporting bird.—*Marcell's Hill-side and Border Sketches.*

GOODNESS OF NATURE.

Goodness I call the habit, and goodness of nature the inclination. This, of all virtues and dignities of the mind, is the greatest, being the character of the Deity; and without it man is a busy, mischievous, wretched thing, no better than a kind of vermin.—*Bacon.*

EYE-MEMORY.

BY CALDER CAMPBELL.

WHEN the present all around me
Forms a picture of fair things,
That awake bright thoughts within me—
Fairy shapes and seraph wings—
Then I quench my thirst at fountains,
Fountains of eternal springs.

Fancy sheds o'er all the sunshine
That is bred of pleasant thoughts;
And with pulse that beats unfevered,
Fancy every object notes,
Till each individual aspect
In a sea of beauty floats.

Then the present is before me,
Standing in its field of power,
Till at last the past steals o'er me
As from clouds the falling shower,
While its memories restore me
To another scene and hour.

One brief glimpse at things familiar
To the visions of our youth—
One quaint view of objects common
To our early sense of truth—
One glance at the alien corn-fields
Bringeth back our boyhood's ruth!

Oh it is a mystic wonder
This same memory of the eye,
That with no loud sound of thunder
Pierceth our humanity,
But with force that keeps time under
Rouseth up old sympathy!

One small flower, whose shape and colour
Noteless to all others is,
Brings a vivid recollection
Of some bygone vale or bliss:
Here a bier, and there a bridal—
There a tear, and here a kiss!

Even upon yon wall the shadow,
As it falleth, calls to mind
Shades of woods where I, a truant,
On the thick green boughs could find
Joys that had no taste of sorrow
With their fruitage intertwined.

Often, as we linger idly
O'er new paths, we come upon
Something—field, or hill, or streamlet,
Windmill, glittering in the sun—
That we knew by frequent visits
Long ago, ere youth was gone.
Yet these scenes are strangers to us,
Though their forms are old and dear;
And Eye-Memory, through and through us,
Runneth like some liquid clear
That is poured from jewelled chalice
By a spirit hovering near.

It were well if recollections
Of the past were always drawn
From the eyes, whose retrospections
Have no tempest in their dawn:
Happy he whose calm reflections
Pass not the paternal lawn!
Happier still if our Eye-Memory,
After travelling far, bring home
Sweet experiences—telling
Of the sadness and the gloom
We have aided in dispelling
From some fainting neighbour's room!

CHAMBERS'S INSTRUCTIVE AND ENTERTAINING LIBRARY.

To this series of BOOKS FOR THE PEOPLE has just been added,
LAMARTINE'S TRAVELS IN THE EAST.

VOLUME I.

Price 2s. sewed, 2s. 6d. cloth boards.

To be completed in Two Volumes.

s Volume II. will be issued on the 1st of June.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also
sold by D. CHAMBERS, 29 Argyll Street, Glasgow; W. S. ORR,
Amen Corner, London; and J. McGLASHAN, 21 D'Olier Street,
Dublin.—Printed by W. & R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 331. NEW SERIES.

SATURDAY, MAY 4, 1850.

PRICE 1½d.

SOCIAL LIFE IN FRANCE.

A COUNTRY TOWN—A BATHING-PLACE.

MADAME LA COMTESSE DE SOLMANIE, one of the many who lost all by the first Revolution, came to live with us when I was four years old, under the pretence of being governess to me; the only mode my parents could devise, without hurting her feelings of sensitive delicacy, to induce the kind-hearted being, from whom, in happier days, they had received much attention, to take up her abode in their house. She spoke her own language with purity and elegance, and every motion was grace; but more than this she could teach nothing, except perhaps embroidery, inasmuch as, beyond reading and writing moderately, and spelling very incorrectly, she had been taught nothing herself. She and her daughter Caroline, however, remained as part of the family until the Restoration, six years afterwards, enabled her to return to France, and die where she first drew breath. We two children, much about the same age, loved each other like sisters, and parted in despair; and Caroline's first action, after her marriage to a young employé of noble family who had obtained a very good place in a town I shall call Tourloville, was to beg and implore of me to come and stay with her. This at the time I could not do; but a few years afterwards, Colonel and Mrs Mellerton, who were travelling by a circuitous road to Paris, dropped me *en route*, and we had the happiness of meeting once more.

Madame de Vorinfort was a thorough Frenchwoman, while upon me, ignorant of everything French but the language, the impression made by customs and manners so unusual was so great, that I think I can call to mind even the slightest circumstances distinctly. The house in which the De Vorinforts lived was at the lower and more fashionable end of the principal street, which was narrow, paved with painted pebbles, and *sans trottoir* of course—Paris itself in those days (though not very distant) being equally ill off in this respect. Lamps 'few and far between' were swung across on ropes; and the gutter was in the middle, where the inhabitants every night deposited in heaps all things that the want of proper drainage prevented from being carried off in a manner less conspicuous and more agreeable to the senses. After eleven in the day, however, nothing of this last nuisance was very perceptible; and the picturesque forms of the irregular old houses much delighted me, as did also the quaint, old-fashioned appearance of everything around. M. de Vorinfort's house, *entre cour et jardin*, made rather an imposing appearance from the street, owing to the length of the front; in depth, however, it was so deficient, that a corridor and a room, neither of them very wide, were all it could contain. The numerous windows, with their espagnolettes of clumsy woodwork, the ill-seasoned, shrinking,

skirting-boards, and the ill-fitting doors, made it very cold in winter; for the elegant folds and festoons of the side draperies were more thought of than the comfort of ample curtains of more homely stuff; and as for carpets, there were none. In my progress down the *grande rue*, followed by two porters with my luggage, I met a diligence; and while I was staring at the enormous wagon-like vehicle, covered with the dirt that had adhered to it from the day it was first used, drawn by strong, shaggy, ill-groomed horses, three and two abreast, piled up to the clouds, and thatched (a sight never to be seen now), a gentleman's carriage, with an earl's coronet and a common rope harness, passed. The loud smacking of the whips, the shouts of the respective postilions, in jack-boots and queues, so confounded my weak mind, that I did not observe a donkey with huge panniers on either side, upon which sat a lady with her feet in one of them, who, bowing politely, apologised for pinning me up tight against the wall, while some rude children called out 'Ah ha, Madame G—— D——n! c'est une Anglaise, bien sur—regardez son chapeau!'

This chapeau, of the shape called a French cottage, had originally come from France, in consequence of which I had had it cleaned, turned, and trimmed to travel in, by this ingenious proceeding hoping and expecting to escape observation. I did not then know that fashions four-years old were with our volatile neighbours as little worn or remembered as those before the great revolution; and as the humbler classes do not wear bonnets at all, they are as much surprised at an unusual shape as their betters. At the present day, however, fashions change less rapidly, and the difference between the costumes of the two nations is also much less observable than it was then. I gazed with interest at the shops, many of which had no windows at all; the goods being displayed on a sort of stall, over which was a wooden or canvas awning, to the former of which shutters were attached at night. The shopkeepers seldom wrote their names above their doors, as ours are obliged to do; but painted upon the walls of the house the articles they principally dealt in, as was, I believe, formerly the custom in Scotland—of which country, indeed, I was continually reminded. The tones, some of the words, and many of the habits, were completely Scotch; and I have also, in some of the out-of-the-way villages, seen old women whose caps closely resembled 'mitches,' carrying 'stoups,' and screaming to one another as like my own dear countrywomen as possible. The appearance even of the interiors of many country cottages was quite what I had often seen at home, and *soupe à la graisse* and 'kail' are surely cousins-german—both equally bad. I have been a long time travelling down the *grande rue* with two tall porters at my heels, so I must not keep my readers long at the door. It was promptly opened by a *valognaise* in the high peacock-

tailed cap, which is so becoming individually, as well as collectively (not the case with all Norman caps). She wore also the long dangling gold earrings, and heart and cross, called now-a-days a 'Jeannette;' and instead of the gay-coloured handkerchiefs which I had observed in the streets adorning the necks of the women, a lace tucker of frill reached to her collar-bone.

'Montez,' said she uncereemoniously; 'madame y est.'

'Pay the porters,' answered I, putting my purse into her hand, and commencing my voyage of discovery. The first door I opened led into a long lofty room with yellow damask chairs ranged close to the wall on one side, and the same number of crimson ones upon the opposite. It contained, moreover, a *canapé*; two handsome mirrors; a chandelier, which hung from the centre of the ceiling; and on a sort of sideboard, as also upon the chimney-piece, were bunches of artificial flowers in China vases, covered with glass shades, and a pendule representing Cupid sharpening his arrows. The light-brown painted and waxed floor shone like a looking-glass, adding to the cold, uncomfortable appearance of the whole; but as this was evidently *not* the apartment where madame was, I opened the next. The floor here was of brick, like the stairs and passages. A common deal table stood in the middle, and under it circular straw-mats for the feet. White cotton window-curtains, with red cotton borders, an *armoire*, a *secrétaire*, a buffet, more flowers under glass shades, another mirror, and another pendule. What could this be? Not a gentleman's dining-room certainly, yet scarcely a servants' hall. My third attempt was the right one. There sat Caroline—I remembered her perfectly, as she did me, although I had arrived two days before I was expected; for in an instant we were in each other's arms; and after we had cried heartily, and begun a great many unfinished sentences, sometimes in French, sometimes in English, our national language coming naturally uppermost, we drew our chairs close to the fire, and commenced some more coherent inquiries.

In a short time Mariette called her mistress out of the room, and I had then leisure to glance around at its furniture. The fireplace was lined with white Dutch tiles; an enormous *bûche* reclined against a high bank of ashes; and one or two bits of wood, like stakes cut in three, rested on dog-irons, giving more heat than one would have imagined, but constantly requiring replenishing, and consequently as troublesome as dull, for I soon found it not good economy to be perpetually keeping up a blaze, and wood is not now to be had for a trifle. Two very high, very broad, very uncommon-looking sofas next attracted my attention, having never before seen anything that resembled them. A drapery of yellow silk, appended to a huge gilt ring fixed to the ceiling, hung over both; two round, hard, bolster-shaped cushions of the same material were at each end, over what appeared to me something very much like a yellow silk counterpane, trimmed, like the curtains, with handsome brown and yellow fringe, and hanging nearly down to the floor, only *just* showing a carved mahogany board, that all but touched it. At the further end of the room was a large gilt angel, holding a circular looking-glass, to which the expanded wings formed a sort of outward drapery, if I may so express myself, whilst folds of the richest lace were festooned immediately below; a *secrétaire* and *commode en marqueterie* with yellow marble tops, and two elegantly-formed tables, supporting alabaster and China ornaments, were against the walls; while the everlasting pendules and

flower-globes ornamented the chimney, and completed the furniture of the room, the floor of which was waxed, and presented nothing nearer a carpet than a wolf-skin-rug. An ivory workbox stood upon the *commode*, a knitting-table by Caroline's chair, and I was busily examining the progress she had made in a shawl when she returned. I expressed my admiration at the several things I had been looking at, particularly these 'curious sofas.'

'Sofas, ma chère amie! They are beds. You will occupy one of them to-night, for I am not satisfied that the couch destined for you is yet sufficiently aired, and monsieur's room is undergoing repair, so he will sleep at the Cheval Tricolor. I don't allow the embroidered pillow to be placed on them, being too much of a Parisienne to admire anything so provincial; but now I recollect that in England the beds are all *lits à quenouilles*, I don't so much wonder at your mistake.'

'We have,' answered I, 'what are called French beds in our dressing-rooms, and in all small rooms in newly-furnished houses; but *they* are not exactly like these. How do you manage at night?'

'Look here,' said she, lifting up one of the before-mentioned silk coverings, and displaying underneath a well-made bed all ready turned down. 'And now, come this way,' opening, as she spoke, a dark closet, where square plain pillows, common tufted quilts, wash-stand, towel, &c. were seen. 'When I have done dressing, and gone to breakfast (we breakfast at twelve, and coffee will be brought to you at eight), these things are all removed, beds made, windows opened, floors sponged or waxed, and all is ready to see company. I receive twice a week—Tuesdays and Fridays—although *my* day is properly Tuesday; for Madame Charenton has taken Friday, and as she almost always has dancing, no one comes to me but in the morning.'

'But, Caroline, do you always sit in your bedroom?'

'Always, except sometimes upon Tuesdays, and when we give our two annual dinners and *bal prié*. People of our fortune all do so—it is much more comfortable and economical. Mariette would grumble sadly if we used more rooms.'

'Is Mariette your own maid or the housemaid?'

'We have just two servants, ma belle: Louis, who is cook, footman, valet, and chambermaid; and Mariette, who dresses and sews for me, dusts my valuables, makes my bed, and opens the door.'

'How different from England!' exclaimed I.

'And from English fortunes,' answered Caroline. 'We have just 15,000 francs a year (L.600), and one house. Little Philippe, who is already ten years old, is at college (I wish it had been Philippine, but one child is enough with our income), and we are pinched enough, I assure you, to make a proper appearance. But I hope Auguste will be promoted soon, for he has the promise of at least a good sous-prefecture. Ah, here he comes!—how pleased he will be to know my dear Dora! Dinner will appear in five minutes.'

'But,' cried I, 'we are not dressed!'

'Dressed, ma bichette!—no one is coming to-night!' answered Madame de Vorinfort with a look of surprise.

From the low bows and elaborate compliments and speeches with which M. de Vorinfort greeted me, I should never have guessed him to be the affectionate, warm-hearted creature I afterwards found him; and I half wondered to see Caroline upon such familiar terms with so fine-spoken a gentleman, of whose face I could only distinguish a pair of black eyes and the end of a

high nose, so completely was the remainder of his countenance buried in a profusion of dark hair.

'Diner est servi,' announced Louis, opening the door, attired like a very respectable butler. Half an hour ago I had caught sight of him in a white suit, with a tufted nightcap on his head, busily pounding in a mortar.

'We have had no time to make any addition to our family fare, Dora, so you must pardon a very bad dinner. Your journey will have provided you, I hope, with that best of sauce—a good appetite.'

We sat down in the brick-floored apartment before described at a round table, upon which was laid, on the cloth, a very long loaf. A tureen stood in the middle, with the cover inverted, containing a cabbage. The soup was clear, light-coloured, well-tasted enough, but poor; and I declined my portion of cabbage, which looked, however, hard and round, about the size of a large apple, and of a pinkish colour: not at all like the vulgar English vegetable bearing the same name. Then came the *bouilli*, which I was told always to call bœuf, as the word *bouilli* was provincial, and vulgar in the extreme. A *civet de lièvre* followed, and then a beefsteak from the fillet, lightly done, touched with Lucca oil, and surrounded by bits of fried potatoes the size of hazel-nuts. Afterwards appeared whittings, with a very nice sauce; and four bits of feathery paste and a Savoy cake formed the dessert, and finished the repast. Each dish was served separately, in order to be hot; but cold plates were set down for us to eat from, which seems a strange contradiction. I may mention here that, generally in unpretending houses like the De Vorinforts, the same knife, fork, and plate served for two or three things, bread being used to wipe the two first upon, and to gather up every vestige of gravy or grease left upon the latter; but upon my second visit, some years later, I rarely perceived such habits practised by any respectable people. The universally-prevailing one also of pocketing sugar, legs of fowls, rolls, &c. which happened to be left after the travelling-breakfast or dinner at inns, is now quite on the decline, although not yet entirely abandoned; for I have even observed it practised at Paris, so late as 1847, by people whose exterior would not have led one to expect such a thing. Caroline drank *eau rouge*, but the sour, astringent vin ordinaire I thought quite weak enough to be swallowed undiluted; and in hot weather it is neither unpleasant nor unwholesome, although I consider it to be both when the glass is below 60 degrees Fahrenheit. After partaking of a small cup of coffee, very strong, without milk or cream, additions which are never given but at breakfast, we returned to Caroline's room, where we sat chatting until bed-time sent M. de Vorinfort to the hotel, and brought Mariette to prepare matters for our couches, by conveying the ornamental pieces of furniture to the dark closet, and substituting the more useful ones I had observed there in the morning.

Madame de Vorinfort, although young, and possessing a very tolerable complexion, thought it necessary to rub well into her face, neck, and arms, for the purpose of softening the skin, a pomade composed of *beurre de cacao*—white wax and almond oil—which was washed off next morning with *lait virginal* to strengthen it. For the benefit of economically-disposed female readers, I will describe how this pomade is made. Gum benzoin, storax, nutmeg, and cloves, all reduced to powder; put two ounces of this to a pint of the strongest spirits of wine; keep it exposed to a gentle heat for a fortnight, shaking it every day; then let it clear, and bottle it. A pint of good white-wine vinegar added to this turns it into *vinaigre de toilette*, which is said to be still more efficacious, as it prevents or cures sunburn. This cosmetic ceremony almost every Frenchwoman goes through night and morning, especially when she nears that time of life when saucy young men begin to count our ages as they do at piquet—eight-and-twenty, nine-and-twenty—sixty; and many, as time further advances, add an issue on the left arm for the benefit of

their *teint*, which fact I record for the benefit of such of my fair countrywomen as are fond of following French fashions. No other washing did I ever see, a bath once a week being thought sufficient. I myself heard an exquisite, greatly admired in second-rate circles, say to a friend as he left the bath establishment at Cherbourg, 'Me voila degreissé pour la semaine!' The nightcap Madame de Vorinfort slept in was exchanged for another clean one, of the same form and material; a piece of 'unnecessary and unusual extravagance,' Mariette said—'Quand on ne voit que son mari et son amie'—['When there was nobody to see but one's husband and one's friend']; no stays; the feet were thrust into slippers; and a dressing-gown was worn, until, as it was receiving-day, Caroline attired herself with simple elegance, and led the way to the dining-room, where the breakfast was served, while Mariette prepared her room. *Café au lait* and rasped rolls, but no butter, were upon the table; a bottle of wine, sweet-bread *en fri-cassée*, pears, apples, omelette, and a very nice dish made from the entrails of a pig, the name of which is illegible in my journal, were what was served up; and every day it was much the same sort of thing. I declined being presented to Caroline's friends that morning, in order to unpack my things and make my room comfortable; and as, I found, we were to go to Madame Charenton's in the evening, where there was to be dancing, I had my dress to arrange.

The carriage being announced, I hastened down stairs, and was astonished to find Caroline in the same violet silk dress she had worn in the morning, nothing in her beautifully-dressed hair, and gold bracelets and brooch her only ornaments. She looked for an instant at me, I thought, with a vexed expression of countenance, but said nothing. Judge, ye ladies, of my feelings of shame and annoyance when I found myself the only person *en toilette de bal* in the room, the only one having bare arms, low dress, white shoes, and flowers in my hair—for even the youngest girl wore long sleeves, pelerines, black shoes, and hair without ornament, although evidently arranged by an experienced coiffeur. But although I must have appeared very absurd and over-dressed, such was the politeness of all present, that no one seemed to see I was different in any way from themselves. They complimented my dancing; the materials of which my unfortunate dress was composed—it being thought not rude, but the contrary, to remark what your friends wear; and all present seemed to try how they best could show their kindness to the foreigner: no smiling, no staring, no whispering, even from the youngest. The girls, after dancing, returned to their places beside their chaperone, and every one appeared to keep the place she had at first taken or been handed to. No flirting, walking about, or sitting apart, did I perceive; no introductions took place; every person admitted was supposed to be upon an equality for the time being. Any gentleman asked any lady, although no one spoke if not previously acquainted, at least to an unmarried girl. This acquaintance, however, did not sanction a bow in the streets—in France, by the by, it is invariably the man who bows first; and indeed, unless a gentleman is very old, or infirm, or ill, it is not even thought quite proper for a demoiselle to make inquiries after him. Every two dances or so, *eau sucrée* was handed round; and this, by the way, is not the rapid, insipid stuff people find it when they merely put three or four lumps of sugar into a glass of water. You must fill your tumbler nearly half-full of sugar, with a dessert-spoonful of treble-distilled *eau de fleur d'orange*; fill it up with fresh water, and let it stand *quiet* until nearly melted; then stir it briskly round, and drink it off, and I think you will vote it a spirited, agreeable draught. During soirées of course it is made previously, and is carried round with almond milk, and negus made from vin ordinaire, little light cakes, *marrons glacés*, or some such slight confectionary; and near the end of the evening, hot, sweet, strong punch, which the exhausted dancers

(and we really *do* dance in France) find very invigorating.

The music at Madame Charenton's was contributed by ladies on the pianoforte, and gentlemen who accompanied them on the flageolet, flute, or violin. We broke up about twelve—many having disappeared quietly before. No form, no ceremony, no trouble: everything seemed an every-day affair; for it is in their manners and address that the French—the provincial French particularly—are so ceremonious: in their *habits* they are easy—very different from our stiff English mode of labouring through our amusements, even in the best society. Madame la Comtesse de la Buntalrie was there, the Vicomte and Vicomtesse de Rochecourt, La Marquise de la Tarellerie, the Comtesse de Quincampoix, and several others really noble—an important distinction, for mere titles were in France constantly assumed on not only loose grounds, but frequently on no grounds at all. But I should never have discovered, from their behaviour to others, or that of others to them, that there was any difference of position between them and the townspeople, many of whom would not have been permitted to enter a drawing-room *chez nous*.

Almost every lady here had her *day* for receiving, and saw company morning or evening, but upon no other day. Then house, hostess, and *bonne*, were all dressed out in their best, and it was marvellous how well people contrived to look, for that one day at least, on their poor five thousand francs a year (L.200). However slight the material of which their dress was composed, it was fresh, and fashionably made; however ceremonious the *abond*, the matter and the manner of the phrases were all *selon les règles*, for which there are manuals published and *studied*; and there was among them, in spite of this appearance of being got up for the occasion and the day, an absence of pretension to be greater than their station, which formed a pleasing contrast to the manners of little people in our own land. At few of these Tourloville soirées was there any dancing. We took our work, and sat in a circle, while *ces messieurs* played at *écarté* apart. Sometimes there might be a little music, vocal or instrumental. Every person did what he *could* when asked, and all were thanked and complimented, as well as listened to. Society was made a pleasure to those who composed it, and a few candles, cakes, and glasses of *eau sucrée* formed all the expense. No one dressed, according to our acceptance of the word, except for *bals priés*; and then the new toilettes made the often-worn, smart dresses of *les Anglaises* who were invited look very ill-fashioned. Freshness and simplicity are the chief aims of the French, richness of material and expense that of the British; and where both cannot be had united, surely the former is preferable.

At last 'rosy May cam' in wi' flowers,' and most of the higher classes visited Paris for a month or so before betaking themselves to their country-houses or farms, some of which were situated not much above a mile from Tourloville. Others, especially during the heats of July and August, repaired to a small bathing-place about seventeen miles distant. Among the latter were the De Vorinforts, who engaged the upper flat of a cottage, containing three tiny rooms, for two months. We dined at the table-d'hôte, where the cookery was exquisite; danced at the Ranelagh, where the music was good; sat knitting or netting under the lime-trees, or in some of the arbours erected on the promenade, *always* in public. This love of society foreigners carry to an extent that is inconceivable to us home-keeping islanders; but the following manner in which it was manifested at the time I am attempting to describe is now, I am happy to say, upon the decline everywhere. Being ordered by my medical adviser to bathe, I went to order a gown and cap.

'Madame has forgotten the trousers.'

'No, it was not a forget, for in England we do not wear them; but pray make me a pair.'

'French ladies,' said the *conturiere* with a look of stern morality, 'would be shocked at the very idea of bathing without them.'

At Penne de Piedford there were no machines; but little wooden buildings on the shingles served to undress in. The first time I went I was early, and the beach was without visitors on my arrival; but when I opened the door of my *baraque*, I saw, to my horror and dismay, two gentlemen in the costume of New Zealanders (to speak modestly), and three ladies muffled to the throat, their heads covered with square black oil-skin caps, edged with blue binding, all dipping and diving, whilst others were proceeding to join them. I stood irresolute; but Madame Charenton, taking my hand, drew me into the water, whilst M. Charenton, an enormous aldermanic figure, followed in the costume described with his young daughter in his hand, laughing, and both in the highest spirits.

'Ah, you are sadly timid!' cried Madame Charenton. 'Monsieur Agamemnon will take care of you.'

'Avec plaisir!' exclaimed M. Agamemnon. 'I will make a courageous bather of mademoiselle, and teach her to swim!'

There was nothing for it now but to dip once or twice, and affect a terror I did not feel; and this Caroline helped to make public, promising to keep my secret, and not expose me to the derision of her country-people, who could not be made to comprehend my feelings of disgust at the primitive appearance they made. To my dying day I shall never forget M. Charenton as he ran down the declivity; indeed during the whole exhibition I was speechless: but no one ever found out that my conduct did not proceed from fear or illness. A young lady, and the gentleman to whom her parents had arranged she was to be married in six weeks, formed part of the above company; and yet it would have been considered quite *inconvenant* had they been left in a room together for five minutes. She knew no more of his habits, disposition, way of thinking, or character, than she did of those of her new footman, who had been recommended as honest, sober, and civil; and until the marriage was over, he never approached her without low bows, addressing her as 'mademoiselle,' and treating her altogether with more ceremony than is practised in England to a properly-introduced new acquaintance. I was present afterwards at her marriage, which was delayed a little time, in consequence of M. le Curé not finding Monsieur May in a fit state to receive absolution, which is necessary before taking the sacrament, an indispensable part of the marriage ceremony. To every one of the acquaintances of either family printed letters are sent, announcing that Mademoiselle Mélanie Alphonsine Charenton is about to contract an alliance with M. Hercule Emile May; and also from M. and Madame May, and their nearest of kin, *all named*, informing you that their son, Monsieur H. E. May, is going to espouse Mademoiselle Mélanie A. Charenton. Similar letters are written to announce death, invite to funerals, and to anniversary masses; and sometimes the list of relatives is very long. We went to see the *trousseau* and *corbeille*; and many were the compliments and expressions of admiration they gave rise to, the intended bride and her mother sitting in state to receive visitors. The wardrobe displayed appeared to me rather extravagant for the position of the parties—a sugar-manufacturer's daughter and a timber-merchant; but such, it seems, was the custom.

'Well, Mademoiselle Mélanie,' said I, 'allow me to congratulate you; you are full of hope and happiness, very much in love, and'—

'In love!' interrupted the young lady, greatly shocked. 'No, not at all; and were I so, I hope I have been too well brought up to show it. But indeed I should have preferred Monsieur Duval; and I certainly liked Monsieur Auguste Favrier quite as well, and he is much better-looking; but neither of these gentlemen could have allowed me to live *près de maman*; whereas, by

marrying Monsieur May, I am just next door. It will be so nice, won't it, maman? particularly when we have a *poupon* to play with!

The bride was a pretty, innocent-looking creature, barely seventeen, and on her wedding-day looked truly beautiful. Her dress of white satin and muslin, richly embroidered, and trimmed with expensive lace, set off her fair skin and unchanged bloom to advantage; and her veil, falling behind, was fixed in her exquisitely-arranged hair by a coronet of orange blossom. This, when taken off in the evening, is always placed under a glass-case, and never resumed until fifty years have passed, when the old couple (in the lower grades of middle life) go to church in their wedding paraphernalia, and a family feast is held. They very much ridicule our fashion of wearing orange flowers for a month—a custom, too, of recent origin; and no English bride who goes to spend her honeymoon *abroad* should ever practise it, unless she is indifferent to being made the subject of coarse jests. Mais revenons à nos moutons. The wedding finery, boots, shawl, fur even, should it be winter, ornaments, prayer-book—everything the bride wears is white, although the other ladies of the *noce* dress in colours and morning costume, wearing bonnets, &c. Mademoiselle Charenton, with the exception of her cherry lips and cheeks, like the inside of a shell, or the outside of a new-blown rose, was as white as what she wore—too beautiful for real flesh and blood. I felt so irresistibly inclined to touch her—to make sure of its being a living woman, not a wax-doll!—that I feared I should do so *malgré moi*; and in order to resist the temptation, fell behind. She put me in mind of a swan; while little Hercule, by her side in black, looked as if he had already put on mourning for the fate that awaited him.

Their names and ages had previously been put up at the *mairie*, and papers attesting their birth, the marriage of their parents, and fifty unnecessary pieces of information besides, were to be seen there, for three weeks before the ceremony, by every boor who could read. The civil marriage, in *this* instance, took place five days before the religious ceremony; but in good society you are not considered as properly married until the church has blessed the rite, so that the lady usually continues under the roof of her parents till then. At the religious celebration there is a great assemblage of friends and neighbours, and much to be done: happy are the beggars who watch at the church-door, for they invariably get liberal alms; happy are the children, especially the two who support the *poêle* over the heads of the devoted victims who kneel under it, for they come in for bonbons enough to disorder their stomachs for a year; happy the brothers and sisters, and the *gens d'église*—they all get presents; but unhappy 'the husband, who has to pay all.' It requires some courage to be married in England; but in France I really wonder any one is intrepid enough to go through the business from first to last. After the Mays returned from church, there was the dinner, the ball, the supper to be endured; and then the receiving and returning the bridal visits. It was strange to see one who, as Mademoiselle Charenton only a week before, never ventured even across the street unaccompanied by her mother or her *bonne*, never spoke, was seldom spoken to, and passed as a person of no consequence—three days afterwards, as Madame May, going where she pleased, seeing whom she fancied alone, spending money, giving her opinion unreservedly, and scarcely noticing her former companions, who were indeed sedulously kept from her by their parents.

When the *poupon* did make its appearance, Caroline's husband was the godfather; and the presents to the mother, godmother, child, nurse, *gordé*, the *curé*, *beadle*, *suisse*, and the beggars even, exceed belief; he had even to provide the carriage, neither the Mays nor himself possessing one; and all the time he was supposed to consider himself a highly-favoured person in being selected to answer for the little urchin. Surely this must be altered; and indeed already several people of

distinction have made their servants present their child at the font, to save their friends from so much unnecessary expense.

SKETCHES IN NATURAL HISTORY.

THE FROG AND TOAD FAMILIES.

THE Batrachians, notwithstanding some unreasonable prejudices against them, form a most interesting order of the Reptile class. In them we have an animal which at one period of its life is a fish—an animal whose organs of respiration are formed solely for breathing water, whose circulation precisely resembles that of a fish, whose digestive organs are exclusively adapted for the assimilation of vegetable substances; and anon, by a gradual and almost imperceptible change, it has become a true air-breathing creature, endowed with limbs fitted for crawling or leaping on the land, and with a most voracious appetite for flesh.

In the spring-time these changes are daily going on in every ditch or shallow pool beneath our eyes; and yet in how small a degree can we explain or comprehend a metamorphosis which so intensely excites our admiration. We see, indeed, the little tadpole, urging his way through the water with a wriggling and fish-like motion; and we watch him as he slowly loses his long tail by absorption, while his limbs as gradually protrude from his sides. We know that all this while a far more wonderful alteration is taking place in his internal structure; and we see him leave what *was* his native element, and become a denizen of ours. In some instances, as in the newts, we find that the fishy tail is only absorbed in a very slight degree, and the development of the limbs is proportionally feeble; hence we know that these creatures are intended to spend a greater portion of their time in the water, and to visit the land but seldom. Here, however, our knowledge stops, and we must in all humility acknowledge the inability of the human intellect to follow the inscrutable ways of Him 'who doeth great things and unsearchable—marvellous things without number.'

The frog is the prettiest and pleasantest of his order. Notwithstanding his cold blood, he is very capable of attachment; and will, when he has once lost his fear of man, become one of his quaintest and most familiar companions, and hop and frolic in his presence with as much glee and as much awkwardness as if his human companion were merely one of his fellow-frogs. Dr W. Roots had one which domesticated itself in his kitchen. Every evening, when the servants went to supper, froggy would peep out of his hole, as if to reconnoitre, and presently he would hop out, and bask on the warm, bright hearthstone, until the hour at which the family retired to bed. What makes this circumstance still more singular, is the fact, that a mutual friendship sprang up between the frog and an old cat, who shared the fire-side with him, and appeared most solicitous to avoid disturbing her little friend.

The frog has a curious way of showing his emotions, whether of fear, pleasure, or pain; namely, by means of his chameleon-like power of changing—not, indeed, his hue, but its intensity: becoming pale with terror, or displaying his spots and markings in all their brightness and distinctness when he is well and happy. He never appears so handsome as when, in a cool and dewy autumn evening, he hops forth for his evening walk. Then he may be seen in the damp grass, occasionally darting forth his long and folded tongue, and seizing some hapless insect, which he instantaneously devours, though in an off-hand way, and as if he did it accidentally while thinking of something else. Then perhaps he will sit for some moments, apparently in a most philosophic state of thought, which is interrupted by his suddenly executing three or four frantic and ecstatic leaps, ending probably in a headlong plunge

into some neighbouring ditch, where he exhibits swimming powers which might excite the envy of a Leander.

Nor, if we seek him in the early spring, shall we be disappointed of our anticipated interest and amusement. We know that he lurks in the marshy pool; but ere it has dawned on our sight, we hear a dull, though not unpleasant, croaking sound. At first the noise seems so ubiquitous, that we scarcely know on which side to seek the croaker; presently, however, a louder, more defiant croak becomes our guide, and cautiously advancing, we descry about two hundred staring eyes, and half that number of tuneful mouths, in our immediate vicinity. But we, too, are discovered by these watchful eyes; and by a simultaneous movement the marsh seems deserted, and we are almost tempted to believe that our eyes and ears have been 'fancy led;' yet we pause until we can assure ourselves of the fact, and presently discover first one pair of the staring orbs, and then another, just peeping and dipping down again; then one tremulous and inquiring croak is heard, but still we remain immovable; this gives confidence, and the croak is answered. In a short time all the heads once more emerge, and all the throats are once more strained for croaking. And thus the chorus continues, until by moving—nay, almost by breathing aloud—we again reduce it to silence.

Professor Bell well describes this croaking as being, 'when heard in the calm of a still, mild evening, far more pleasant and soothing than many a more fashionable and dearly-bought musical entertainment'—words written in a spirit very different from that which made the feudal lords of the ancient régime of France employ their vassals in beating the waters of their castle moats, when the evening drew nigh, in order to terrify the frogs, so that they might not disturb their evening repose. This custom continued in some districts, it is said, up to the period of the first Revolution.

The frog has been much distinguished in literature; as examples of which we may adduce the celebrated Frogs of Aristophanes, and the various fables of Æsop and others, in which he sustains the part of the principal character. Then Homer himself, having sung the wars of Achilles and Agamemnon, thought it not beneath his dignity to record in verse those of the Frogs and Mice. And last, though not least, we may point to the pleasant and well-known history which tells us how 'Froggy would a-wooing go.' We should like to ask the giants of natural history, and the great physiologists of the day, if they would *gravely and honestly* say that they had ever written a more characteristic and descriptive portrait of the animal than that contained in the line—'a gaping, wide-mouthed, waddling frog?'

Nor is the frog without its superstitious associations. Among the ancient Egyptians it was a sacred animal, probably for the same reason that it is still considered by the Virginians as a kind of genius, to whom their fountains are sacred—namely, on account of its purifying the waters. One of the ingredients in the witches' caldron in 'Macbeth' was, as our readers will recollect, 'toe of frog;' while Soane, in his 'New Curiosities of Literature,' gives us a charm which consists in tearing out the tongue of a living frog, taking care that no other part adheres to it, and then throwing the poor wounded creature into water. This tongue you are then to lay on the heart of a sleeping woman, who will thus be compelled to return a true answer to whatever you ask her. We would recommend the charmer in this instance to inquire of the sleeper what she thinks of the kindness of his disposition.

The old stories—scarcely yet extinct—of showers of diminutive frogs originated, as is well known, in the myriads of young ones sometimes seen, whose metamorphosis has just been suddenly completed by the genial moisture.

A correspondent of the 'Zoologist' gives a very interesting account of some frogs which gathered round his window, crawling up the sun-blind, and peeping into

the room, each in his turn. Fancying, however, that they were merely attracted by the light, he took no notice of their movements; but on the following morning he discovered that all their anxiety was caused by the accidental imprisonment of one of their companions between the window and the blind. Many instances are given of the occurrence of the frog in trees, blocks of stone, &c. but the evidence is not so conclusive in these cases as in those relating to toads; yet it is well ascertained that, in addition to the power of respiring through the lungs, the frog—like the toad—obtains air, or aerated water, through the pores of its skin, so that atmospheric moisture will keep it alive for a considerable time, even when all access of air to the lungs is prevented.

Professor Bell, in the year 1839, described two species of the frogs as natives of Britain—namely, the common frog (*Rana temporaria*), and the larger Scottish frog (*R. Scotica*), which is recorded as occurring in Forfarshire, and in the neighbourhood of Edinburgh, as well as near Loch Ransa in the Isle of Arran. This frog was for some time regarded as the edible frog (*R. esculenta*), though that animal is scarcely so large as the common frog, while it presents a striking difference of appearance from either of the above. In September 1843 Mr Bond discovered the true edible frog in the fens of Foulmire in Cambridgeshire. This announcement caused a warm discussion; which, however, we must regard as decided, when we find that in the following year Professor Bell, the highest authority, stated that he was 'enabled to designate it positively as the true *Rana esculenta*.' And the only question now remaining seems to be, whether or not these frogs were originally introduced into the country by some fricassée-loving monks of old. That they have been long known to the peasantry of Cambridgeshire, is proved by the names—descriptive of their shriller croaks—bestowed upon them, of 'Cambridge nightingales' and 'Whaddon organs.'

We do not mean to describe the *Hyla*, or tree-frogs, none of which are British; but we cannot resist a passing glance at the exquisite construction of their webbed feet, which are furnished with cushions, forming suckers, by means of which they firmly adhere to the under side of the smoothest leaf—just as the fly walks, head downwards, on our ceilings.

The common frog, notwithstanding an existing opinion to the contrary, is as much eaten in France and Germany as is the true edible frog. The taste for frogs does not appear to have been general until a late period, as the author of 'Devis sur la Vigne,' writing in the year 1550, describes his amusement at seeing them brought to table; and Palissy, thirty years after, says that in his time few were found who were 'willing to eat tortoises or frogs.' The ancients, however, ate them, and, moreover, valued them in an extraordinary manner, as specifics in a list of diseases much too long to be inserted here.

The toad is a hapless animal, which has been most ungenerously treated by man; for, not contented with deriding its ugliness, he has associated it with all vile things, and condemned it, for its want of beauty and grace, to become the emblem of evil; and he has, furthermore, endowed it with a poison so intense, that Aelian declares that it can—basilisk-like—slay by the very power of its eyes. 'It is a serious misfortune,' says Buffon, 'to resemble detestable objects;' and carrying out the spirit of his own observation, he has loaded the poor toad with every epithet which disgust and misapprehension could dictate.

We have handled many toads, and we know that they are not poisonous; ugly we will grant them to be, but beautifully adapted to their office in creation; and, moreover, personally useful to man in keeping in check the insect legions which, even in this mild climate, would, if unmolested, speedily become a positive evil. If gardeners knew their own interest, they would by every means in their power encourage a reptile which devours their

slugs, worms, and wood-lice, and saves many a tender plant from destruction. We have seen them kept in greenhouses or frames with the greatest advantage.

This reptile is, as is well known, very easily tamed; and Pennant's history of Mr Arscott's affectionate toad must be too familiar to our readers to be here repeated. We once knew a toad which came every evening after sunset, throughout a summer, to saunter leisurely up and down our veranda, though he not unfrequently found it already occupied by the children, whose presence, however, did not appear to annoy him in the least. He was somewhat of a sentimentalist; and when the silver light of the moon fell, like an angel's path, on the sea, he seemed more intent on the picture before him than on procuring his evening's meal; however, when lights were brought into the drawing-room, the moon and the sea were alike forgotten, and he turned to gaze on the brighter and nearer light. Before rain he was unusually active and gay, and bustled about in a remarkable manner.

Mr Bell had a toad which would sit in one of his hands while it ate out of the other. Like all its congeners, this animal refuses food which is not living; and, moreover, requires the ocular demonstration of seeing it move before it seizes it. Like them, too, the common toad (*Bufo vulgaris*) sheds its skin at stated periods; but its hybernaculum is different. Instead of nestling in the mud, it retires alone to some sheltered hole or hollow tree, and there sleeps until the spring sun once more renews its activity.

We cannot quit our subject without alluding to the accounts of living toads which have been discovered in stones, trees, or coal-beds, though the possibility and probability of the case have been so amply discussed, that it must be familiar to all. Jesse mentions one which he found in a mulberry-tree, which by its annual layers of wood was fast enclosing the poor animal. And we could cite instances innumerable—and apparently well authenticated—of toads which must, if they were enclosed at all, have been enclosed for hundreds, perhaps thousands of years. From these instances we cannot altogether withhold our belief; yet we must receive them with caution; for though a toad will live *for months* in a box enclosed in plaster of Paris, it will do no more: yet even in this caution we must bear in mind what has been already said of the cutaneous respiration of the frog, and which perhaps applies in even greater degree to the toad.*

The toad was fabled to bear in its head a precious jewel; yet it was deemed so malicious, that even when dying, it would, if possible, swallow the gem, in order to prevent any one from profiting by it. This jewel afterwards degenerated into a simple stone, which, however, was still valuable on account of its medicinal properties; but even these have faded away, and the much-sought stone has turned out to be merely the fossil tooth of some species of shark or dog-fish. Yet we can forgive the superstition, and also the ugliness of the animal, for the one beautiful moral—

'Sweet are the uses of adversity,
Which, like the toad, ugly and venomous,
Wears yet a precious jewel in his head.'

The limbs, the juice, and indeed every part of the toad, have at different periods been employed medicinally. And 'though few,' says Griffiths, 'would knowingly eat a toad,' great numbers of their hind-legs are annually sold in France to eke out the supply of those of the frog.

Our only other British species of toad is the natterjack (*B. calamita*), which, curiously enough, is placed by Buffon amongst the frogs. It varies in very many particulars from the last kind; but perhaps the most conspicuous difference may be found in the bright

yellow line along its back, and in its movement, which consists of a quick run; the eyes are also much more prominent. It is not a common species, but abounds in some districts.

A PLOUGHMAN'S FORTUNES.

'Some are born great, some achieve greatness, and some have greatness thrust upon them,' says Malvolio. The hero of the following sketch, by a union of energy and good fortune, fulfilled literally the two last clauses of this sentence. In the church at Bunbury, the tourist is attracted by an exceedingly beautiful monument and effigy, both of the purest white marble; remarkable also for the exquisite neatness and care with which they have been preserved—'Owing,' the sexton will tell you, 'to the generosity of Dame Mary Calvely of Lea, who, in 1705, left the interest of a hundred pounds to be distributed annually among the old women of the parish, on condition that they attended divine service while they were able, swept the chancel, and *cleaned the monument*.' He who sleeps beneath this magnificent tomb was born of free, but poor parents, in the neighbouring hamlet of Calvely. I say *free*, because his birth occurred at the period when England was still a feudal country—that is, in the reign of our third Edward (the precise date is unknown)—and he might have chanced to be a serf: as it was, he was not bound by other ties than those of habit and poverty to his native place; and the spirit of adventure soon caused him to break these in order to 'seek his fortune,' like the heroes of those romances and legends which the wandering minstrels had made popular throughout the land. It would take some effort of the imagination in these days of locomotion to conceive the difficulty with which the boy Hugh effected a journey from Calvely to London. He walked, and worked, doing every now and then a day's labour for the refilling of his wallet; occasionally receiving hospitality from the female peasantry, who were touched by his youth and good looks, and amazed at the marvellous daring which was leading him to distant London; or accepting thankfully, and without shame—because the church gave it—the dole of food daily distributed at the gates of the monastic buildings he passed. At last the bells that proved of such good augury to Whittington greeted his ear. He had arrived at the great city of which such marvellous accounts had reached him in his distant birthplace.

The ploughboy's imagination had perhaps conjured up a vision of greater splendour and beauty than London in the olden time presented; still, there was much in the scene around him to awake his rustic wonder. The booths, far exceeding those of Bunbury Fair; the number of people moving about; the stately procession of monks bearing the host, that glided past, followed shortly afterwards by a knight and his attendant lances, excited to the full his boyish admiration. He wandered for three days about the capital—getting a meal daily at the gates of the monasteries—with still unsatisfied curiosity, but with hourly-decreasing hopes of making his fortune in a place where he was totally unknown, and where his rural skill could be of no avail to procure him employment. On the fourth morning he found himself in Southwark, before an inn bearing the sign of the Tabard. A band of pilgrims, bound for the shrine of Thomas à-Becket, was in the act of issuing from its courtyard—we may fancy it the very same of which Chaucer has left us such an animated picture; but if so, one personage was omitted by the poet—we mean a tall, stalwart man in armour, well mounted and armed, who rides last in the procession: not a reflection of the 'courteous knight' in advance, but a grim soldier with a scarred brow, and the look of one accustomed rather to the camp than the court. This worthy is struck, as he passes him, by the powerful figure but juvenile countenance of the young spectator of their departure; he pauses, asks him in a brief, quick tone of command some few questions, and on learning from the simple lad that he had come to London to 'seek his fortune,' laughs aloud and heartily. Hugh looks not only confused, but angry; and the soldier, becoming

* In an article in No. 369 of the Journal, old series, it is suggested that the frogs may have been enclosed in the forming rock when in a torpid state, and retained in that condition during many ages, there being no circumstance to revive them, no waste in their bodies, and consequently no need of nutrition.

suddenly grave, assures him that it is in another land men of mettle win their way to wealth and power. In short, he offers the ploughboy a place in his own bold company of 'Tard Venus or Milendring,' a species of banditti then existing on the continent, formed of the disbanded soldiers of different nations. He was, he said, on his way to fulfil a vow at the shrine of St Thomas of Canterbury, from thence he should proceed to Dover, and then to France; if Hugh liked, he might accompany him. The proposal chimed in with every wish and fancy of the wanderer, and was eagerly and gratefully accepted. Thus our hero became a Free Companion, and speedily added to the skill he already possessed in wrestling, quarterstaff, and archery—horsemanship, and the perfect use of the weapons of the age. Old Fuller speaking of him, says, 'It was as impossible for such a spirit not to be, as not to be active,' and accordingly we find that he was soon distinguished above his companions. The Free Companies of English, though living by plunder, preserved in a remarkable manner their love of their native land and their allegiance to their sovereign: they were always ready to espouse the national cause against France, and at Poitiers served under the banner of England, and did good service; amounting in number then to 40,000 veteran troops.

The extraordinary military skill and prowess exhibited by Hugh of Calvely in this battle procured him his knightly spurs, and the command of a large company of the Free Lances. We next find him at Auray under the Lord Chandos, turning, by his individual valour, the fortune of the day, in which the great Du Guesclin was taken prisoner. The captivity of the French leader led to an intimacy between him and Sir Hugh; and after Du Guesclin's liberation, his influence induced the English knight to join him in his expedition into Spain, to dethrone the tyrant Peter the Cruel, and place his brother Henry in his stead. The enterprise was successful, and the favour of the new monarch promised to assure the fortunes of the adventurer; but our hero's high sense of loyal obedience appears to have always outweighed that of his own interests, and on receiving through Lord Chandos a positive command from Edward III. to forbear hostilities against Peter of Castile, he deserted the quarrel he had espoused, and joined the Black Prince as soon as he appeared in Spain. The battle of Najasa followed, and the valour of Sir Hugh de Calvely is said to have greatly contributed to the victory obtained by the English, which replaced Peter on the throne of Castile. On the recall of the Black Prince by his father in 1367, Sir Hugh was consequently left in command of all the Free Companies. Thus far he had 'achieved greatness;' now he was 'to have greatness thrust upon him,' and in the very manner of which Malvolio dreamt.

There dwelt not far from the head-quarters of the Free Companies in Spain a royal widow, Donna Leonora of Arragon. This lady had heard much of the courtesy and valour of the English commander, and honouring the qualities then held in the highest esteem, invited Sir Hugh to her castle. He went, and probably for the first time in his adventurous life mixed in the society of ladies. It was no marvel that Leonora of Arragon, though many years his senior, engaged the fancy of Sir Hugh de Calvely, especially as her avowed partiality for himself flattered his vanity. Her exalted rank placed but a slight barrier between them, for it was the period when

— 'A squire of low degree
Marrying the king's daughter of Hungary.'

was no impossible occurrence. So Sir Hugh de Calvely took heart of grace, and wooed and won the Queen-Dowager of Arragon, obtaining thus a royal bride of mature years, and an immense fortune. From this period he ceased to lead the Free Companions, but dwelt in all honour with Donna Leonora at her Spanish castle, till her death, which took place some few years afterwards. In the last year of Edward III. he returned, a wealthy and honoured knight, to his native land, and was appointed governor of Calais. Two years afterwards, he plundered and burnt Le Bas Bretagne, and destroyed

several vessels that lay in its harbour: he also retook the Castle of St Mark, which had been lost by neglect.

In 1379 he resigned the government of Calais to the Earl of Salisbury, and was appointed by Richard II. *admiral of the fleet*! Surely the wildest fiction never invented a tissue of more wonderful changes of fortune than those which marked the real existence of Hugh of Calvely.

During this period of active service to his country he found time again to woo and win a bride. This lady was young, fair, and wealthy, the daughter and heiress of Lord Mottram of Mottram. 'By her his line was continued.' In 1382 we find him governor of Guernsey and the adjacent isles, from whence, at the end of his appointed period of lordship, our adventurer returned to dwell in the neighbourhood of his former home, towards which, doubtless, during all the vicissitudes of his wonderful life, his heart had often yearned. How years must have changed that quiet hamlet since he had left it! There was the same armourer's forge, the same village green and maypole, the same mill, and trees, and fields, and stiles, as of yore, but the old people were all gone—the middle-aged grown hoary—the children become men and women, as busy and as self-important as the generation gone by. We cannot, however, suppose that the leader of the Free Companions was a man given to sentimental regrets. He doubtless thought with gratitude of the good Providence which had actually granted him the fortune he idly sought, and with some pride of the exertions and energy which had (humanly speaking) secured it. We *know* he built a lordly home near his humbler one, and proved a kind lord to his dependants, and a good father to his children, to whose filial piety he owed after his death the beautiful monument in Bunbury church. He lived to extreme old age, even into the reign of Henry IV., for Rymer mentions his name in a suit at law then to be determined, but observes that he was 'weak of body;' after which history and tradition are silent respecting this favourite of fortune. The marble tomb tells us the rest.

CHLOROFORM,

ITS TESTS AND MODE OF PURIFICATION.

[This paper, which has been obligingly furnished by a very high authority—Professor Gregory of Edinburgh—we take leave to recommend to general attention, as it may assist in removing those objections to the use of a drug truly dear to humanity, which have arisen solely from the failure of the southern pharmacopologists to produce a pure article.—Ed.]

CHLOROFORM may be obtained either from alcohol or from pyroxylic spirit, by distilling them with chloride of lime (bleaching powder) and water. As the pyroxylic spirit of commerce is a variable mixture of several liquids, one only of which yields chloroform, there is necessarily obtained from it a variable amount of chloroform, mixed with several of the original impurities of the spirit, and with some new oils containing chlorine, which are generated in the process. With alcohol the chloroform is obtained in nearly uniform quantity, and contains no impurities except oils, analogous to, but probably not identical with, those formed from pyroxylic spirit. When derived from either source, chloroform *must be purified*; and although that from pyroxylic spirit is at first much more impure, yet when both are fully purified they are absolutely identical in all respects.

Chloroform is commonly purified by rectification, by washing with water, or by the action of sulphuric acid. These methods are employed by different makers, but the purification is rarely if ever complete, and has often been most imperfect. This is extremely dangerous, because the oils above-mentioned are very deleterious when inspired, causing migraine, sickness, and vomiting. These effects may be produced by chloroform containing but a small proportion of the oils—the vapour of

which comes in contact with the internal surface of the lungs—and even when the chloroform is of a quality much better than has often been used, especially in London and other parts of the country. A larger proportion of oils, such as is sometimes found, may produce very serious results; hence the absolute necessity of perfect purification, which, as we shall see, is easily effected.

It is essential that every medical man should be enabled to ascertain readily whether any given specimen of commercial chloroform be pure. The specific gravity was formerly recommended as the best test, and that of 1.480 was considered a guarantee for its purity. But this is too low a standard, our best Edinburgh makers having for some time sold it of density 1.494 to 1.497—the highest then known. We have lately ascertained, however, that pure chloroform has the density 1.500, and it is now sold of that density by the Edinburgh makers. For common use the specific gravity character is rather too troublesome, from the necessity of attending strictly to temperature (since *one degree* makes a marked difference), and of having delicate instruments. We therefore recommend two tests, which are easily applied, very delicate, and give, when combined, positive certainty, although even one alone will in most cases suffice:—

The chloroform should be well shaken in a closely-stoppered (not corked) dry phial, with from one-fourth to one-half of its bulk of oil of vitriol, colourless or nearly so, and of density not under 1.835, better 1.840. One-fourth is usually quite enough. If any trace of oils be present, the acid becomes immediately more or less yellow; and when allowed to stand, a darker line often appears at the junction of the liquids. When, after shaking, this no longer appears (and by this time the acid is more or less brown), the chloroform is poured off into another phial, where it is again shaken with a new but smaller portion of acid. If this, after a time, remain colourless, the oils are destroyed, and it only remains to remove from the chloroform the sulphurous acid formed by the action of the oils on the sulphuric acid. This is easily done by pouring the chloroform into a third dry phial, and there shaking it or allowing it to stand with a little peroxide of manganese, till its smell is quite free from that of sulphurous acid, which is very soon the case. It is then of specific gravity 1.500, and absolutely pure.

It will be seen that, for the sake of brevity, we have here combined with the account of the first test that of the application of it to the perfect purification of chloroform. In fact these are joined in practice, for until the chloroform no longer discolours the acid, it is not pure; and out of twelve recent specimens of commercial chloroform recently examined by us, only one stood this test.

The other test is perhaps still more delicate. If a little chloroform be allowed to evaporate from the hand, it leaves, when pure, *no smell*. But if a trace of oils be present, they, being less volatile, remain, and present their disagreeable aromatic odour. This odour is generally in proportion to the effect in colouring the acid; but the test is more delicate, inasmuch as, besides all the others, even that specimen which did not colour the acid left a barely perceptible odour, showing that even it was not *absolutely* pure, although for use it is to be regarded as pure. We have obtained chloroform which left no smell whatever on the hand; but the test is so delicate that it is difficult to procure the drug of this quality. When of a quality at all below first rate, chloroform leaves a strong and distinct smell of the noxious oils, and of course colours the acid.

These tests are so easy, that we expect every purchaser to try one or both, and we advise him to reject all chloroform which decidedly colours the acid or leaves a strong smell. This is no hardship to the maker, for we have given him as easy a mode of puri-

fication. But no consideration of this kind should be allowed to interfere.

Here we may state that rectification, after the first distillation in which the chloroform is produced, is, at least as far as our experience goes, unnecessary. The first product is simply washed by shaking with water till it no longer diminishes in volume. It is then treated with oil of vitriol as above, and no rectification is required.*

Pure chloroform produces none of the distressing and persistent sensations that may be caused by that which is impure (even although only slightly impure); at least, in numerous trials on ourselves and others, we have never seen those symptoms which often occurred in similar trials with unpurified chloroform of different qualities. We find from the information supplied by Dr Simpson, that even pure chloroform occasionally causes vomiting, but we believe this to depend on the fact, that it is administered on a full stomach; and we understand that, as in our experiments, its use is not followed by persistent migraine and sickness, or febrile acceleration of the pulse, all of which effects we attribute, when they occur, to the oils present in the chloroform of commerce.

But the effects of decidedly impure chloroform are very disagreeable. As no absolutely pure chloroform has yet been sold, so far as we can ascertain, by any maker out of Edinburgh, while a large majority of the makers have sold a very inferior article, it is not surprising that its use should have proved less satisfactory, for example, in London than here. To give an idea of the fact, we may state that we have examined recent specimens which contained only 3-4th, $\frac{1}{2}$, 1-4th, 1-5th, and even so low as 1-20th of their volume of chloroform. They were charged with the poisonous oils, and generally also with the original impurities of pyroxylic spirit. Nay, one specimen, labelled 'Pure Chloroform,' hardly contained a trace of that liquid, and did not even possess its smell! It was so full of free hydrochloric acid as to corrode the cork. What evil effects might not be anticipated from the use of any of these kinds of chloroform! We do not publish the names of the makers, because we believe they acted ignorantly, knowing neither the danger, the presence of impurity, nor how to get rid of it. But we cannot acquit them of want of due care and inquiry as to the properties of the drug. The specific gravity varied from 1.365 to 1.475 in the better sorts of those just mentioned, while in the worse it was far lower. It is not creditable to our country that persons so destitute of chemical and pharmaceutical knowledge, as some of these makers must have been, should be permitted, without let or hindrance, to set up as makers of such potent drugs.

Fortunately for Edinburgh and for chloroform—we may add, fortunately for suffering humanity—the Edinburgh makers have always taken the best means and the greatest pains to produce good chloroform; and have always kept pace, as they do still, with the progress of our knowledge of this remedy. This is one, perhaps the chief cause, why fatal cases from the use of chloroform are here unknown.

To illustrate the bad effects of a small amount of impurity, we may mention that on one occasion Dr Simpson received a bottle of apparently good chloroform from a maker—not in Edinburgh—who, to our knowledge, did his utmost, according to his information, to purify it. As long as Dr Simpson used this chloroform all his patients suffered from persistent acceleration of pulse and other febrile symptoms, so as to keep him and his assistant for a week or more in a state of continual anxiety. At last he suspected the cause; and returning to the best Edinburgh-made chloroform, was no more annoyed by these troublesome symptoms. Now

* Distillation or rectification with sulphuric acid is not effectual, because the chloroform distils from its surface, as it would from mercury, and is not purified, from want of contact. If well agitated with the acid, the purification is complete, without rectification, after the removal of the sulphurous acid.

we are also told, that during the whole time of using that chloroform, the handkerchiefs employed were quite offensive from the smell left upon them, which even washing did not remove! We know that that chloroform was not purified by sulphuric acid, and these facts prove the importance of what we have stated above. Yet that specimen was considerably above the average in quality.

But there is another cause why chloroform in Edinburgh has not been attended, in so many thousand cases, with fatal effects: it is the care and judgment with which it is used, and the great experience which the Edinburgh practitioners, with Dr Simpson at their head, have acquired in this matter. It would be invidious here to specify cases, but we know that elsewhere chloroform has not always been judiciously or cautiously employed. When this is attended to by an experienced practitioner, it may be used, and is used, with great freedom and boldness; but a trifling neglect, or ignorance on the part of those who assist, of the signs which indicate that enough has been given, may easily lead to very distressing results.

As medical men, however, will generally use so powerful an agent with due caution, we are inclined to believe that, had only pure chloroform been used in London, there would by this time have been no prejudice against its employment there; and that, as we have now put it in the power of all to procure it absolutely pure, chloroform will soon be as extensively used as it deserves to be.

WHAT I SAW ONE NIGHT IN INDIA.

THE annual inspections and reviews being over, I had obtained a month's leave of absence from my regiment, at that time occupying the lonely fort of Chanda, the capital of a district of the same name subject to the Marhattas, and some eighty-seven miles distant from Nagpore, which was indeed the nearest station to us where the sight of a British face or the sound of a British voice could delight our eyes or ears. Chanda, situated amongst jungles, and overlooked by the remote Goand hills, continued but a short time to be garrisoned by the Honourable Company's troops; prevailing fever made it unhealthy, and frequent visitations from cholera of a singularly fatal character led to its evacuation. But in 1820, when we were sent there to protect the surrounding country from the aggressions of migratory bands of marauders—the remnants of the broken-up Pindaree and Goand armies—prosperous was that officer deemed who, by any circumstance apart from death or dishonour, was prevented from joining his corps within the seven miles of walls that enclosed the old straggling city and fort of Chanda. The produce of the district consists principally of rice, millet, pulse, and some sugar-cane; but the agricultural classes possess also large flocks of goats and sheep; and from the milk of cow and buffalo great quantities of *ghee*, or clarified butter, are prepared for the market. This *ghee*, which, in its best condition, and when fresh, is white and firm as curd, and perfectly inodorous, is far superior to the rancid butter and lard of European kitchens, and is carefully packed into huge *dubbers*, or kegs of hardened leather, and thus conveyed for sale to the towns and villages in the neighbourhood. Scarcely knowing whither to direct my course, in the total want of any objects of interest within a convenient distance, I resolved on making a shooting excursion towards Nagpore; and if wearied of myself and my gun, I decided on remaining at that gay station for the full period of my leave. About twelve miles from Chanda there was a small village called Bassim; thither, then, I forwarded my tent and regimentals over-night, intending to ride out there the next morning with two comrades, who, like myself, were anxious to verify the reports that had reached us of the prolific nature of the adjacent jungle in the provision of game. We accordingly reached Bassim to breakfast, and found it very prettily imbedded in a

series of woodland tracts rather than jungle; nor were our sporting expectations baffled, for we found so many birds—from the pea-fowl that supplied the *fond* of our soup at a late dinner, to delicate floriken and stately bustard—that when, on the following morning, they bade me 'God speed,' I made up my mind to remain where I was for another day or two.

The beauty of those woodland tracts, as, in the diminished glare of a July sun I wandered amongst them that afternoon, could not be surpassed in the whole range of sylvan scenery. On leaving my tent, pitched in a little grove of mangoes near the village, I told my domestics not to expect me before dusk; and having ascertained that no tigers lurked amongst the fastnesses of the *near forest*—in which, here and there, large patches of cultivated land, redeemed from the jungle, proclaimed the gradual progress of agriculture—I fearlessly plunged into a tract of *bush*, which, having neither the density of large trees nor the intricacy of close-creeping underwood, was in nowise sombre or menacing. It was, in fact, more like the long-neglected park of a gentleman's residence in some woodland county; and frequent open glades of grass, whose verdant hues were becoming renovated from the first showers after the hot months, were beautifully, if irregularly intersected by tiny brooks; rocks of small size, but of quaint shape, fantastically covered by parasite plants; and snug little dells, whence now an antelope, and next a hare, and again a scowling, cowardly hyena, darted out. I carried a fowlingpiece, as in duty bound, but truly I made little use of it at any time, and on this occasion rather considered it an encumbrance, for I felt a greater inclination to scramble about in search of wild plants and their fruits and flowers, than to attack the peaceful inhabitants of the wild wood.

At length, fairly wearied, I flung myself down beneath a glorious tree of the wild fig, or *Ficus glomerata*, in the axilla of whose dependent branch grew clusters of crimson fruit. Alas! like the apples of the Dead Sea, they but feasted the eye; for though they turned not 'to ashes on the lip,' I found them pregnant with 'insect life;' they were, in fact, nests swarming with little black-winged flies, to whom *Acheta Domestica*, in his charming 'Episodes,' could have assigned a category and a name. However, contenting myself with a few ripe jujubes that grew near me, I drew out my pocket-book, and, in the act of pressing into it a little unknown flower of exquisite beauty, fell fast asleep.

My awakening was not of the most agreeable nature, for I was roused by a painful blow of something on the bone of my leg. At the instant I neither remembered where I was nor what had led to my situation there; but gaining a sitting position, beheld with a start of terror a harpy-faced creature stooping towards me, and fixing a pair of red menacing eyes upon me. Again it struck me with its beak, and then I uttered a loud cry, which had the good effect of infecting my assailant with my own fears; for it receded, and I saw what it was. A few paces backward had fluttered a huge bird; one of those ghastly, bald-headed vultures of Hindoostan which are found congregating wherever garbage and carrion spread out their fetid banquets on the face of the land. Peering at me, its fishy eyes imbedded in red sockets of what seemed raw flesh, its dingy-white wings extended and flapping, as if preparatory to attack, it gave a harsh scream, and, as I imagined, was about to pounce upon me. Whether such was its intention, who can say? However, I seized my Manton, which lay beside me, and levelling it at the gluttonous-looking creature, shot it through the head. It was at anyrate the only bird I had shot that day, and immense was the excitement my success seemed to create around me. A flock of noisy green parrots, and chattering, dark-feathered minas from the tree above me, spoke discordant plaudits as they burst from its green recesses; while two squirrels darted frantically past me with sharp chirrupings, and from a neighbouring bush sneaked out a sly crouching creature, which I took for a civet cat.

At all events I had now leisure to observe that a change had crept over the face of the heavens; the sun was at its setting: I must have slept more than an hour. I had no watch, but the lengthened shadows and the purple and golden haze which clad the woodlands apprised me of a fact that was at least probable: I might chance to be benighted in those woods, which, if safe and pleasant for day-pastime, were not enviable for night repose. In some hurry and confusion I started up and away, and had walked a considerable distance straight forward ere I was aware that the sun, or rather its declining radiance, was still in my face, as it had been when I set out, and that consequently, if I wished to return to Bassim, I should now turn my back upon it. I did so, but got quickly puzzled; and soon remarked, from the increasing size of the timber, that I was getting more deeply into the forest. I could distinguish no path, though hitherto there had been perceivable several of those tiny, well-worn tracks that pierce through and intercross each other in most of the jungles near a town or *steading*, and which are so aptly named, in the dialect of the natives, *chow-rusta*—that is, thief-tracks. Again I turned back, striving as much as possible to keep the sun behind me; but the sudden gloaming of Hindoostan fell upon me as I hurried on through brake and brier, and there was scarcely a gleam of daylight left to direct me, when all at once I saw in front of me a little tank, or lake, I knew not which, on the borders of which arose the dark walls of an edifice.

Hurrying up to it, my disappointment was at the full to find it to be the ruins of an old pagoda, evidently long neglected, and almost entirely covered in by long trailing lianas. A solitary idol crumbled in front of it—the mouldering janitor to the dismantled temple! No floral offerings of moogra or chrysanthemum evinced recent devotional visitor; no benzoin, no scented gum, announced sacerdotal presence. As I stood, plunged in reflections that were not very exhilarating, a loud growl from the jungle was heard; and at some distance from where I watched their advent, two creatures—a she-bear and her cub—trotted towards the water. I was now fairly 'in for it!' Should I wait their approach, or take flight in the darkness? My ammunition was not of a description to protect me from such assailants if attacked. Meanwhile they seemed perfectly unconscious of my proximity, and drank very peaceably of the water, playing a hundred clumsy antics, which the increasing obscurity made dimly visible to me. At length, however, they retreated as they had come; and as to my left the jungle appeared more thin and low, I began to look about for a path. None could I find; and at last I really deemed that the best thing I could do would be to remain where I was until the first dense darkness of night receded before the coming stars, and the moon, which I knew must ere long make its appearance.

The front of the pagoda facing the tank was a heap of ruins; but as I carefully reconnoitred it, I found that to the rear, where it looked upon the jungle, an archway and a few pillars remained in tolerable repair. Here, then, I seated myself on a fragment of stone, and waited with what patience I could muster for Cynthia and her train. As I sat there, all the various and strange sounds of night grew and grew, until I could have guessed the season by my ear alone, even if I had been blind. There was no wind, but the whirring of myriad insect beings, aroused from day-sleep, caused a sort of under sound akin to air. Mosquitos from the woods and the water fastened on my face, and kept my handkerchief in constant play to drive them off. Night birds—the owl, that ever and anon hooted by, and then pounced down upon some shrew, mouse, or rat; the rice bird, snapping its bill as it caught at the fetid green bugs which careered around; and presently, deep in the brush, the bark, short and sharp at first, of a jackal, speedily taken up by another, and then another, till a whole pack gave forth the fearful howl, prolonged

as it proceeds, that so often startles the silent watcher of the night in India. Hisses, too, were in my ears; and more than once I fancied that a whole legion of snakes was approaching me; and then from the tank ascended a concert—the harsh and many-toned voices of a million frogs, those enormous bull-frogs whose discordant utterance makes itself heard for more than a mile in the silence of the night. Most welcome sound of all came at last the piercing tones of a Kulera horn, and then the beat of tom-toms—for I knew they must proceed from Bassim. They were right behind me, so that, in fact, my path lay beyond the tank; but more light was absolutely necessary to search for it with any chance of success.

And light, too, I soon had in front of me; but a light so fairy-like, so fleeting, so spiritual, that I gazed on it with an admiration the same spectacle had never failed to excite. At the foot of a range of bushes I first beheld what seemed to be a spark of fire, the glitter of a gem; presently there broke out another, which rose in the air, and thereupon a whole host of gleaming mote-sized cressets leaped up and down, and whirled over the tree-tops, and twisted in mazy dance through the boughs, and gemmed every leaf with all the most dazzling tints of red, and topaz, and amethyst. Oh those beautiful fire-flies! Yet almost as suddenly as they had come they vanished; or, by some mute confederacy, did they but put out their body-lamps to reserve their lustre for some future occasion? Scarcely had they disappeared, ere a real star shot out into the heavens; a faint, but no longer dubious light, like the first errand of dawn, stole over the sky; and by and by I could see that the moon was about to show herself.

At that instant voices from the jungle struck upon my ear, so near at hand, that I was on the point of hailing the owners, when a presentiment—men use that word so vaguely!—a sense of caution came over me, and I remained silent, retiring behind the pillared archway just in time to conceal myself from the comers. They were two men, in the ordinary costume of respectable Mahratta travellers, wearing white garments and turbans, with swords stuck in their belts, and each his shield. But their hands were engaged in dragging what to me appeared to be a dead animal. Within a few yards of me, but round a corner of the pagoda, to view which I found it necessary to leave my recess, and lean across a dismantled fragment of the building, they halted; and then—for now the moon was actually up—I saw that their burthen was no animal, but a dead man. It was a large and heavy corpse, dressed in rich raiment, for I could plainly distinguish the brocaded trousers, the gold-hemmed robes, the silver-mounted creese in the burnished belt. And then one of them spoke in the common *rehkta*, or mixed dialect of Hindoostan—at which I rejoiced, for I understood neither Persian, nor Mahratta, nor Telogos, nor Tamul.

'Take off the *roomal* (handkerchief), Kahoo; it has done its duty once more: it is the seventh time, and must therefore be now discarded. Burn it we must, and place it before the idol of Kalee. This fat unwieldy hog's son must be disposed of. Now for his girdle and turban.'

I saw them untwist a long noose-like piece of linen from the corpse's neck, on which the bald head fell loosely back. He had been strangled by Thugs, and the Thugs were close to me! They divested him of his girdle, which made a clinking noise as it struck the ground.

'Do not rip it open, Kahoo; said he not that he had a hundred ashrafies of gold, and four dozens of earrings and nose-rings about his person? Look to his turban; they are safer where they are.'

They undid the windings of the turban, from which I saw them take many jewels; which, with the girdle, they stowed away amongst their garments. I raised my Manton: a strange desire came over me to kill those wretches; but I remembered that what might kill a vulture, might but scratch a man. Had I slain those

murderers of the murdered, would it still have been murder? Be sure that it is God's to punish! And when, many years thereafter, I saw at Guntvor, in the Northern Division, no fewer than 160 convicted Thugs working in chains, I thought that it was very possible those two men were amongst them.

Presently one of the men withdrew into some nook of the ruins, the other dragged the body nearer to the tank, and I heard him tell his comrade to fetch the *hodali*, or pickaxe. I could now no longer see them, but I heard the stroke of the pickaxe, and knew that they were digging a grave; and by and by I also knew, by the sound of trampling, that they were pressing the earth compactly over their victim. A crackling noise succeeded, and from the bright reflection that shone all around, I guessed that they had lit a fire over the grave—their common practice.

A complete silence, that lasted for more than an hour, convinced me that they had either departed, or had fallen asleep; and I was on the point of stealing from my hidingplace, when loud voices in the distance beyond the tank reached me. I heard the shouting of men; and amongst the advancing voices there was one that was familiar and most welcome to me.

'Sahib azeez! Sahib, kehan hue toom?'—'Master, dear master! where art thou?' Yes, sure enough it was the voice of my faithful Sooliman! And then gliding cautiously from my retreat, I looked for the Thugs. They were not visible; but a large fire lay smouldering near the lake, and some burnt rags were strewed before the hideous idol. Were the Thugs sleeping in the temple? I knew not, neither did I care; for now flashing across the water I perceived the glare of many torches, and with a loud voice I hailed my servant. In a few moments thereafter he was at my side, kissing my hands, and thanking Allah and the Prophet that I was found.

It may be as well to say that although information was given to the head man of Bassim, as well as to the proper authorities in high places, as to what I had witnessed, no discovery of the murderers was made; nor were any traces of them found in the ruined temple. There was a buried body, and that was all.

Tales for Young People.

HILDA'S SECRET.

HILDA was very busy indeed. She sat on her stool at the window with her French book in her hand, and a dictionary on her lap, studying hard. She allowed nothing to distract her attention. The kitten could not understand what was the matter. It put up its little paw and patted her, and mewed, and then scampered off, and came back again, rubbing its dark face against her knee; but it was of no use, and Puss had to roll herself up, and sing her sleepy song at her young mistress' feet. At last Hilda jumped up, and clapping her hands, ran to a lady who was sitting at the other end of the room writing. 'I can say it now, mamma,' she cried. 'I have found out every word, and can't think how it was so difficult yesterday.'

The lady, whose name was Mrs Mowbray, smiled and took the book, whilst Hilda first repeated a short French fable, and then translated it into English. 'You are a dear good child,' said her mamma when she had finished. 'You do not know how much I love you when I see you so industrious and anxious to please me: I, too, am anxious to please my little, dutiful child. I will take you with me in the carriage to-day wherever you choose. Tell me where shall it be?'

Hilda thought for a little, and then said, 'Well, mamma, if a fairy were to come and say, "Hilda, you are a good girl, and I will give you what you most wish for," I should answer, "Thank you, Mrs Fairy; take me, if you please, to the Pantheon Bazaar, and give me whatever I choose to ask."'

'Whatever you choose to ask!' said her mamma laugh-

ing: 'why, then, Miss Hilda, I suppose you would wish every pretty thing you saw?'

'No, no, mamma,' answered Hilda gravely. 'I am not greedy or covetous; I only meant *one* thing—any *one* thing, you know.'

'Oh, that is very different: I think I may manage to afford that. Ring the bell, dear, and then make haste to get dressed, as you generally take so long.'

Hilda joyfully hurried away, and with the assistance of her maid was very soon ready. The day was beautiful, the carriage was comfortable, mamma was pleased, and Hilda was happy, so that everything went on well. They first drove round the park, and as it was in the height of the season, Hilda was very much amused by seeing so many different carriages and such a number of beautiful ladies. Then they left the park, and driving down Oxford Street, soon reached the bazaar. Although there were many beautiful things to choose from, Hilda had no difficulty in fixing. Her mind had been made up long ago, and she had been only waiting for an opportunity of darting upon poor papa some day when he appeared capable of being melted. She led her mamma to a stall near the door which generally attracts the notice of little girls. It was covered with the most beautiful wax dolls of all sizes and descriptions. The one which Hilda's heart especially warmed to was the Princess-Royal in a glass-case.

'Is it not lovely, mamma?' she whispered. 'See, it is just like a baby: it has real hair on its head, and real eyelashes and eyebrows; and just look at the dimples in its beautiful arms!'

'It's a real model, miss,' said the person who kept the stall: 'it's the most perfect thing of its kind that has ever been made.'

'What is the price?' said mamma, who began to be afraid.

'One guinea, ma'am, without its clothes; twenty-six shillings if dressed.'

One guinea was a great deal of money, mamma thought; but Hilda had really been a very good child lately, and mamma had been long thinking of giving her a present, so she decided that Hilda should have it. 'I will have this doll,' she said to the stall-keeper, who had been watching her face as anxiously as Hilda. 'Put it up carefully, and take it to my carriage if you please.' Hilda was inexpressibly delighted, and pressed her mamma's hand gratefully. 'I am now going to call upon Lady Harewood in Cavendish Square,' Mrs Mowbray said. 'You will find a young friend there, for Selina is home from school at present.'

'Oh that will be delightful, mamma; it is so long since I have seen Selina, and she is such a clever, funny girl.' To Cavendish Square they drove. Lady Harewood and Mrs Mowbray had not seen each other for some time, so that they had a great deal to talk about. Selina accordingly drew Hilda away to her own little boudoir, and they were soon occupied in talking too.

'What book were you reading, Selina, when we came in?' asked Hilda.

'Oh it is such a delightful book,' Selina answered. 'I have finished it now, and was only reading one of the stories over again. It is called "German Mysteries," and is full of all kinds of horrors—ghost stories particularly.'

'Ghost stories! How I should like to read it!' cried Hilda.

'I will lend it to you, dear, if you like.'

'But I am not sure, Selina, if mamma would like me to read it: she never would let my maid tell me any ghost stories, although I have always wished to hear them more than I can tell you.'

'But you need not tell your mamma, you know, Hilda. If you don't show it, nobody will ever suspect.'

'But, Selina, I never have any secrets from mamma,' said Hilda hesitatingly.

'Is it possible you are such a baby?' cried Selina laughing. 'Why, you are nearly eleven years old; but any one would think you were about three and a-half. Oh, my dear girl, you have no idea of the secrets I have had in my life. At school the scrapes I got into when things were found out—Oh, you never knew anything like them! In my room, where the best girls slept, we used to have suppers every night—fires, too, in the winter, and everything comfortable. We often had books, too, from the library, and—'

'But were you never found out, Selina?'

'Oh yes—once; but we promised never to do so again; and no more we did, till Helen Ames persuaded us to

begin again. But one night, as ill-luck would have it, Helen let a dish fall, and it made such a noise, that Miss Swift came flying up stairs to see what was the matter. Helen was very impertinent, and said she didn't care a bit, and so she was expelled. Oh she *was* a girl indeed! Since she left us, we have had no fun at all.

Of course Hilda was very anxious to hear more about school-life; and Selina, who was delighted to have so interested an auditor, told her everything she could think of, mixing plenty of fancy with fact. At last Mrs Mowbray rose to go away, and Selina stuffed the book hastily into Hilda's pocket. 'We shall be sure to call next week,' she said, 'and then I can get it, you know. In the meantime, be sure you don't let your mamma see it, as she would tell my mamma, and then there would be such a business!' Hilda was rather frightened, but she gave the required promise, and I am sorry to say she rather liked the business on the whole. The fact was, she had long been desiring to have a secret to keep, and one of her own if possible. She had two cousins, a good deal older than herself, who generally spent a few weeks every Christmas with her. Now when Amy and Agnes came, they were continually talking together confidentially; and if their little cousin happened to be in the room, they retired to another part of it, and whispered. Of course Hilda did not like this exclusiveness; but when she used to ask them what they were speaking about, they used always to answer, 'We are talking secrets, Hilda. We can't tell little girls like you what we are saying. You could not keep a secret, you know.' Therefore Hilda had always longed to have a secret of her own. She felt it would make her a person of importance.

When Hilda reached home, she immediately flew to her own little room, and taking the book from her pocket, began eagerly to read it. It was a very improper one, indeed, for her or any other young person, being full of stories which would have terrified a much wiser person than Hilda. Hilda had never in her whole life had an idea of such fearful things. She was quite paralysed with horror, and was now of course more afraid than ever of her mamma seeing the book, knowing how very much she would disapprove of it. Then a new fear occurred to her—where should she conceal it? She had neither lock nor key to any of her boxes or drawers, and she knew that her mamma frequently came to see if all her things were tidily put away. The only thing to do was always to keep it about her person; but as it was not a very small book, that would be, to say the least of it, inconvenient. Hilda began to find out that to have a secret was not so agreeable after all. For the first time in her life she was afraid to sleep alone. The moon, which was shining full upon her bed, was for the first time unpleasant. It cast such fearful shadows upon everything, that Hilda became afraid to move. When she at last fell asleep, her dreams were disturbed, and one time she awoke with a scream, which brought Mrs Mowbray in to see what was the matter. Instead of being soothed, as usual, by a caress from her dear mamma, Hilda was in an agony in case she should, by accident, discover the book, which she had placed under the pillow. She was even thankful when her mamma kissed her and left the room.

In the morning it was all she could do to keep the book hidden from the prying eyes of her maid. She seized an opportunity, when her back was turned, of pulling it from its concealment, and pushing it into her pocket. When she went down stairs, she was afraid to take her usual place at the breakfast-table, close to papa's side, for she thought, 'What if he should feel it in my pocket, and should ask me what it was?—I could not tell him.' However, she artfully contrived to get upon his other side, and then she felt safe. During her hours of study she tried all she could to attend to her lessons; but it was impossible. Strange figures seemed continually flitting before her, and she became afraid of having the book about her, feeling as if a whole world of spirits were confined in her pocket. Mrs Mowbray was not pleased with her. She did not know a word of her French verb, although she had frequently repeated it before without a mistake. Geography was still worse; and she quite forgot whether Queen Elizabeth was the mother or daughter of Henry VIII.

'I see you are thinking of the doll, Hilda, and not of what I am saying to you,' said Mrs Mowbray; 'therefore I will put it away, and you must not see it until you pay more attention to your lessons, and are perfect mistress of them.' Hilda was very sorry to see her mamma so dis-

pleased, and she had almost a mind to confess the whole; but then she felt that would implicate Selina, and get her into a scrape, and, besides, she had promised not to tell.

Hilda was to go out to a party of young people that evening, and she was in the greatest perplexity as to where she should hide the now detested book. Take it with her she could not, for of course her thin white muslin dress had no pocket. To leave it was dangerous; but that she must do. Accordingly, when the time came, she wrapped it carefully up in a handkerchief, and laid it at the very back of her linen drawer.

The party was a very gay one indeed. It was the birthday of the little son of the house, and everything was in grand array. The garden, which was very large, and exquisitely laid out, was decorated with coloured lamps, hung on the trees and shrubs; and as it was in the middle of June, and a very lovely evening, the children were able to enjoy themselves as much out of doors as in. There were fireworks too, for which the little son had especially pleaded; and, in short, everything was charming, and every child but one was perfectly happy. This one I need not say was Hilda. Although she had looked forward to this party for a month at least, she could not enjoy herself at all. Every now and then she said to herself, 'Suppose mamma should have gone to see if my drawers were tidy, and discovered the book: what *should* I do?' This made Hilda very unhappy. She was continually wishing to be at home, to see if all was right. The lady of the house was quite distressed to see her so dull, and came up to her, saying kindly, 'My dear Hilda, are you quite well to-night? Won't you join this quadrille? Alfred is very anxious to dance it with you.' Alfred in the meantime standing a little behind, and looking uneasily, as if he didn't know anything about it. But Hilda's heart was too heavy to allow her to feel any pleasure in dancing even with the fascinating little Alfred; and she was unspeakably thankful when the carriage was announced, and she found herself seated next her maid driving rapidly home. She was quite in terror, however, as she got near Bayswater, where her papa and mamma lived, and begun to sound the maid, in order to get an inkling as to the state of affairs at home.

'Is mamma quite well, Susan?' she began. Susan looked surprised.

'Quite well, miss?' she said. 'Why, miss, she's just the same as when you left.'

'I mean does she seem happy and pleased, Susan?'

'Happy and pleased, miss? Yes, I think so. But what have you taken into your head now, Miss Hilda?'

'Oh, nothing, Susan; I only thought mamma would be dull without me.' This was not true: Hilda's secret had led her into falsehood.

A glance at her mamma's face convinced her all was right.

'Have you enjoyed yourself, my darling?'

'Yes, mamma.'

Another falsehood—Poor Hilda! Again the book was the companion of her pillow, and again her sleep was disturbed. The most frightful figures seemed to be constantly moving about her, and she suffered very much. Cordially did she detest that burthensome secret now; and no one knows how ardently she longed for Selina's coming to take the book away.

Next morning Mrs Mowbray said to Hilda, 'I wish you to be very nicely dressed to-day, my dear child, as I expect your godmamma; and as she is very particular, you must be neat. I think you had better wear the pink dress she sent you lately. It will please her to see you have kept it well.'

Hilda said, 'Yes, mamma;' but wished she had fixed upon any dress rather than that. The fact was, it had no pocket; and as Hilda could not leave the book for a minute, as she knew Susan was of a prying disposition, she was quite puzzled to know where to put it. At last she bethought herself of tying it in a handkerchief, and fixing this handkerchief to her side under her frock. This she did, and then went and sat on her stool at Mrs Mowbray's feet, waiting for her godmamma's arrival. In due time godmamma came, and was very much surprised indeed that Hilda did not, as usual, run to the gate to meet her. She did not know that Hilda was obliged to move as little as possible, as, whenever she walked, the book kept bumping in a most tell-tale manner against her knee.

'Well, how has my little Hilda been since I saw her?' began godmamma kindly. 'A good child, I hope, eh?'

Hilda blushed deeply, which godmamma perceived; and

thinking it was a 'sweet bashfulness,' she drew her close, and was going to take her upon her knee, when Hilda hastily drew back.

'Oh, you think you are too old now, Miss Hilda? Well, perhaps you are.' But Hilda saw, to her sorrow, that the old lady was evidently vexed. 'Perhaps you are not too old, however, to take a present from your old friend? Mamma wrote and told me how good and industrious you have been lately, and I have got a book of beautiful tales here, written expressly for good amiable children.'

Hilda blushed deeper than ever, and feeling how unworthy she was of such kindness, she could not hold out her hand to receive it. This time godmamma was really angry, and looked so: mamma was amazed; and Hilda, looking from one to another, got bewildered, and at last burst into tears.

'My dear Hilda, I am afraid you are not well?' said her mamma. 'She has not looked well for a day or two,' she continued to the old lady, who was really distressed; 'but she will not confess it.'

'Confess what, mamma?' said Hilda, drying her tears, and looking frightened.

'That you are ill, my child.'

'But I am quite well, mamma; only I couldn't help crying just now: godmamma is so kind.'

Godmamma looked convinced, but Mrs Mowbray was far from being so. She saw there was something upon Hilda's mind, but she felt it would be better to wait for her confidence rather than ask for it.

A walk in the garden was proposed; but this, which was generally Hilda's especial delight, was now no pleasure at all. She did not care in the least to show off her own little garden, of which she was in general so proud. The weight on her mind prevented her finding enjoyment in anything. She wondered where her peace of mind had fled. 'I was happy before I had that horrid secret,' she thought. 'Oh I never, never, so long as I live, will conceal anything from my dear mamma again. How miserable I am!' Godmamma at last went away, wondering what blight had come over the usually gay spirit of the little Hilda.

Next week came, but did not bring Selina. Hilda was gradually working herself into a fever: she was now quite afraid to go to bed, and lay trembling in the dark every night. She knew she durst not tell any one, for never before had she felt the least afraid in the dark; and she felt certain that her mamma would think there was something very wrong indeed if she heard Hilda had become so silly all at once. Her lessons were no longer well done, and accordingly the Princess-Royal was kept locked up. She had also a habit of forgetting what was said to her; and Susan could not understand how 'Miss Hilda was always tearing of her frocks just at the pocket.'

'Well, Hilda, what do you think?' said Mrs Mowbray when Hilda came into the breakfast-parlour pale and spiritless one morning: 'a letter from godmamma—such a kind letter, with an invitation in it. I will read the part about you, dear:—"I hope you will allow my little goddaughter to come and spend the whole of next week with me? I thought she looked pale when I was last in London, and I am sure a week of good country air will bring back the healthy colour to her cheeks. I do not mean that she should pine alone in my ancient castle with an old woman like me, as that would do her no good; so I have invited a party of young friends to meet her, and I have no doubt they will all be very happy together, if they will not quarrel. All I require of Hilda when she comes is, that she will wear a pinafore, be kind to my dogs, and not break my old china. I shall expect her on Monday."'

Hilda's eyes brightened. 'Oh, mamma, how kind—how delightful! May I go?'

'Certainly, Hilda; I see no objection: only I hope you will be more industrious than you have been lately in return for so much indulgence.'

Hilda's eyes fell again: she recollected that, till she got rid of the book, she could not give her undivided attention to her studies. She felt she would have given everything she possessed to have seen Selina at that moment.

It was arranged that on Monday morning Mrs Mowbray should take Hilda in their own carriage to Walthamstow in Essex, where godmamma lived; and Hilda had arranged in her own mind that she would ask her mamma to call upon Lady Harewood on their way, and then she could give Selina the book which had so much disturbed her peace of mind. So when Monday came, Hilda asked her mamma

if she might call upon Selina on their way, as she wished to see her very much. Mrs Mowbray consented, and with a lightened heart Hilda took her place in the carriage by mamma's side, and they drove to Cavendish Square. Hilda's heart beat as the footman opened the door. Suppose Selina should be out!—what could she do then?

'Lady Harewood is not at home, ma'am,' said the servant, returning; 'and Miss Selina went back to school last Saturday.'

'That is a pity,' said Mrs Mowbray. 'Now to Forest Castle, Walthamstow, John; but stop for a moment at Houbigant's in Regent Street. You must have some gloves you know, dear,' she continued, turning to Hilda.

'Mamma,' cried Hilda passionately, 'I don't want gloves, and I won't go to godmamma's! If you knew how naughty I have been, you would not take me there I know. I wish to go home.'

'Hilda, what do you mean?—what is the matter with you?'

'Here, mamma; this is what I mean,' and Hilda took the book from under her *visite*, and put it into Mrs Mowbray's hands. 'Selina lent me this book, and told me not to show it to you. I promised. I read the book, mamma, although I knew well you would not have allowed me if you had known of it, and now I was going to return it without telling you at all. Say what you like, mamma, I do not care. You cannot make me more miserable than I have been.'

'You do not care? Hilda, you are rude,' said Mrs Mowbray coldly. 'I beg you will not forget yourself in that manner again.'

Hilda burst into tears; her passionate tone fled, and she said imploringly, 'Mamma, I am shocked at having spoken to you so rudely. Do say a kind word to me. I am so unhappy.'

'Tell me all about this, my child?' said her mamma gently. Just then the carriage stopped at Houbigant's; and after Mrs Mowbray had purchased what she wanted, she ordered the coachman to drive home again, and then sat down to listen to Hilda's story.

'Oh, mamma,' said Hilda after she had finished, 'I thought it would be so delightful to have a secret all to myself, but I do not think so now. No: I never, never will keep anything from you so long as I live. How very unhappy Amy and Agnes must be, for they are always having secrets, and how silly I was ever to wish to hear them! But, dear mamma, you have not said you forgive me?' continued Hilda tearfully.

'I do forgive you,' said Mrs Mowbray sadly; 'but I shall not be able to place any confidence in you for a very long time. What will godmamma say too? You must write whenever we reach home, and tell her exactly why it is you cannot join her happy party.'

Hilda did write to her godmamma, and a very miserable letter it was; but what made her more unhappy than anything, was the having lost her mamma's confidence. She determined to set to work to regain that, and accordingly applied herself vigorously to her studies. It was surprising how much better she could work now when her mind was relieved from 'the secret'; and she felt astonished at the progress she made. Moreover, she obeyed with cheerful alacrity her mamma's every wish, and even tried to find out what was wanted before the wish had been expressed. She listened attentively to what was said to her, and was so obedient and anxious to please, that she became a favourite with everybody. Every morning she came to her mamma and said, 'Have I your confidence now, mamma?' And one day Mrs Mowbray, instead of replying, 'I cannot tell yet,' said, 'You have, my darling Hilda!' Then Hilda was happy indeed, and kissed her mamma over and over again. 'I will never lose it again,' she said joyfully. 'I will take such care of it.'

About the beginning of the pleasant month of August godmamma had another party of young people; and this time there was nothing to prevent Hilda from going and enjoying herself as much as the other children. Little Alfred was there too, and Hilda danced and played with him on the lawn as much as he wished, to make up for the quadrille she had disappointed him in on the night of his birthday. The Princess-Royal too, who had long been released from her confinement in mamma's drawer, accompanied Hilda to Forest Castle for change of air. Hilda valued her beautiful doll more than anything she possessed. It was a painful as well as pleasing reminiscence it brought back to her mind; for she could not see

it without recollecting that on the day it had been given to her, she had burthened herself with her first and last SECRET.

J. G. C.

WORKING-MEN'S ADDRESSES.

At a recent soirée of the Mechanics' Institute, Annan, two working-men present, in addressing the meeting, gave the following account of an effort made by themselves and others to establish a reading-room in John Street, Carlisle, which had proved eminently successful. The particulars will be read not without interest, and may furnish a valuable example:—

'Less than two years ago,' said Mr O'Neil, 'many of the working-men earning small wages felt their inability to pay a subscription to the Mechanics' Institute, and yet were anxious to learn the stirring news of the day, and improve their minds on general subjects. Some of them clubbed together, got a newspaper, without being under the necessity of going to a public-house for one, and at length obtained a daily paper. By and by several gentlemen took notice of them, and aided their efforts. They got a room to themselves in which to read the papers, procured books, and though their reading-room had not been two years in existence, their library now numbered 500 volumes. They then commenced classes for the instruction in reading, writing, and accounts of the young, and the old too, who required it, and in this their success had been great. They had had a soirée lately, attended by the leading men of Carlisle, including the members for the city; and thus encouraged and aided, they had obtained increased means of doing good, and were progressing satisfactorily.'

Another speaker (Mr Burrow), a fellow-labourer in the same cause, added, that 'he would tell them something more about their reading-room and school. They considered they had done not so far amiss in starting the former, but it was soon seen there was something wanting in regard to primary instruction. In the immediate vicinity of the room there were two large factories, and the children, relieved sooner from their work by the operation of the Ten Hours' Bill, had more leisure than before; and when children or adults have leisure on their hands, it is generally employed for evil, unless preoccupied for good. They made a great noise running about the streets, and the supporters of the reading-room thought that if this was allowed to continue, a few bad companions might soon infect the whole children, till they were all bad alike. So one began to say to another, "Could we not start a school?" "Ay, but how is it to be done?" was the response. Well, the thing, once suggested, was talked over and deliberated upon. Their means were slender. They had only one room, and that could not be used for reading in and teaching at the same time, and a second room they must have before ever they could move a step. With some difficulty a room near the other one was obtained, and then a school was set agoing for the old as well as the young. The rules adopted were, that each member of the reading-room should have access to the school for a penny per week, each of their children being admissible for a like sum. In about a month's time it was crowded; and so much eagerness did the children display, that many of them would sometimes be found lying on the stairs long before the hour, because, as they said, they had been unable to obtain admission on the night before, and they were determined this time to be sure of getting in. It had been said by some that the working-classes and their children would not appreciate education when offered to them; but here was a refutation of the statement—children who had been all day occupied in factory labour pressing eagerly forward to obtain the blessings of education. What was to be done under these circumstances? A meeting was called to consider how additional premises could be obtained, and with no small ado they got another room, and opened it also; and thus the working-men of John Street Reading-room had established two schools, one for reading, writing, and spelling, the other for arithmetic; and both were in a high degree prosperous. There is nothing used in the school but a New Testament, a slate, and a ruler. The master dictates the lesson from the Testament, and the scholars imitate on their slates, as well as they can, the printed characters of the lesson, which, in addition to having it from the lips of the master, is placed before

them. They see, by a reference to their book, what is read; and after copying it, the teacher asks them questions regarding each separate word, and its meaning, and thus they obtain reading, writing, spelling, and signification all at once. The teacher had informed him that some of the pupils who had entered the school lately, unable to read or write, were, in the course of a month, able to write the words, and read their own writing. This class is open four nights in the week; and the other class, for arithmetic, taught by two brothers of the name of Latimer, is open the other two nights. In the latter, the higher as well as the simpler branches of accounts were taught, and many of the children who had been there a few months were in the rule of three, while there were two of them in mensuration, and one in algebra. Such was a brief statement of the origin and progress of their schools. Then as to the library: it now numbered, as had been said, 500 volumes, most of them donations. Libraries were springing up almost everywhere; and why? because the age required them. And whatever the spirit of the age asked for, that it would have. He had a few words to say to the working-men, and they were to this effect:—They would not be able to reach a higher position unless they were first prepared for it, and unless they were trying to raise themselves. When a child stumbles and falls, a person would perhaps say to it, "Come here, and I'll lift you!" and the little fellow, cheered by the words, would lift himself whilst running to get the promised aid. Now, however laughable this might be in a child, it was most lamentable in a man. He would say to the working-men, try to raise yourselves, and those in a higher sphere of life would reach forth the hand of fellowship, and you will be sure to be lifted up. Do not trust to others, but to your own efforts; and if you do so, the aid of others will be superadded to your own. Had not the working-men of the John Street Reading-room acted thus, their institution would have assuredly not existed two years. He would advise the Annan mechanics, then, to meet often. Let each contribute a penny a week, and by a fund thus raised they would be able to work wonders. In Carlisle they had two Discussion Classes, where what they had heard delivered to them was taken to pieces and criticised. They had no right to swallow anything addressed to them without first doing this. They had a right to think for themselves. They had been endowed by the great Creator with intellectual faculties, and this was a proof that He designed them to be no idle gift, but meant them to be freely exercised.' Mr Burrow concluded his excellent address with the following lines, composed, he said, by Henry Armstrong, a member of the Botchergate Reading-room:—

'Educate us, and Britain then
Will find her treasure in her working-men;
Vice will diminish; virtue will increase,
And spread her glory through a land of peace.'

QUIN.

The witty sayings and repartees of Quin would fill volumes, and some of them are excellent. Dining one day at Bath, a nobleman said to him—'What a pity it is, Quin, my boy, that a clever fellow like you should be a player!' 'What would your lordship have me to be?—a lord?' was his reply. A young gentleman, who had lately become acquainted with him, volunteered one day a specimen of his talents for the stage; intending, as he said, to turn actor if Quin approved of his performance. He had, however, scarcely concluded the line, 'To be, or not to be—that is the question,' before Quin started up, exclaiming, 'No question at all, sir; not to be, upon my honour!' Lamenting one day that he grew old, Quin was asked by an impertinent young fellow, 'What he would give to be as young as he was?' 'I would even submit,' said Quin, 'to be almost as foolish.' Being ironically complimented by a nobleman upon his happy retreat at Bath, he replied, 'Look ye, my lord, perhaps 'tis a sincere your lordship would not accept of; but I can assure you I gave up L.1400 a year for it.' An officer, not remarkable for courage, came one day to Quin to ask him how he should act after having had his nose pulled. 'Why, sir,' said he, 'soap your nose for the future, and then they'll slip their hold.' The first time he was invited to dine upon turtle, the host, a West Indian, burst into a loud laugh because he did not understand the *callipash* and other niceties of such an elegant dish. 'It may be an elegant dish,' said

Quin, 'but if it had been fit for Christians, we should have been acquainted with it as soon as the wild Indians.' To an author, whose play he had lost, he apologised, saying, 'Here is a drawerful of both comedies and tragedies; take any two you please in the room of it.'—*Dublin University Magazine*.

OLD YEW-TREES.

Decandolle finds as the result of his inquiries, that of all the European species of trees, the yew is that which attains the greatest age. He assigns to the yew (*Taxus baccata*) of Brabourne, in the county of Kent, thirty centuries; to the Scotch yew of Fortingal, from twenty-five to twenty-six; and to those of Crowhurst in Surrey, and Ripon in Yorkshire respectively fourteen and a-half and twelve centuries.—(*Decandolle, de la Longévité des Arbres*, p. 65). Endlicher remarks that the age of another yew-tree in the churchyard of Gresford, in North Wales, which measures fifty-two English feet in circumference below the branches, is estimated at 1400 years, and that of a yew in Derbyshire at 2036. In Lithuania, lime-trees have been cut down which were eighty-seven English feet in circumference, and in which 815 annual rings have been counted.—*Humboldt's Aspects of Nature*.

THE QUALITY OF GREATNESS.

The first universal attribute of truth is its greatness; this quality it is which has mainly fascinated the hearts of those who have most devotedly pursued it. It is the more worthy of our observation, since it is through this quality, amongst others, that we see the moral and intellectual worlds, which are so generally distinguished, and have been so often contrasted, mingle their nature, and pass into each other. For if greatness be an attribute of something which is sensibly or intellectually impressed, still it discloses itself as such by the mode in which our moral, as distinct from our intellectual, nature is affected by it. All greatness expands, elevates, commands, and tranquillises. We know the feelings with which we look upon the starry heavens, the silent outspread mountains, and the ocean. We are conscious how the eye fails to span them, and how the overflowing and incapable sense fixes itself to receive what it cannot contain; scanning, and again scanning, the object which at once invites and baffles, satisfies and eludes it. Such, we all know from experience, is the manifestation of greatness when approaching to the sublime, and disclosed to our bodily senses. But whether it address itself directly to our senses, or whether it be revealed at once and simply to our imagination, as in poetry, or to the imagination as ministering to the intellect which compares, combines, and generalises, as in the higher departments of knowledge, the effect is in kind and character the same. We confess its presence by the same mode of feeling, the same attitude of attention, absorption, submission, and repose. Whether our eye be fixed upon the sublimer scenery of nature, or our fancy be filled with the first and second books of the 'Paradise Lost,' or our intellect contemplate the highest and vastest subjects of human thought, we are in all these instances affected by the same quality disclosing itself in a different way through different objects.—*Vaughan's Inaugural Lectures on Modern History*.

COAL TRADE OF GREAT BRITAIN.

There are upwards of 3000 coal-mines in Great Britain, which employ nearly 250,000 men, women, and boys, under ground and above, termed hewers, putters, trappers, overlookers, bankmen, &c. &c. The capital invested in working-stock, tramways, staiths, and harbours, altogether exceeds £30,000,000 in value! and the 'get of coal,' as it is technically termed, amounts to 34,000,000 tons annually; the estimated value of which, at the 'pit's mouth,' is £10,000,000. Of this enormous quantity of coal, one-third is raised in the Northumberland and Durham districts, from whence the chief exports of the kingdom are made by the rivers Tyne, Wear, and Tees, both foreign and coastways. The chief points of home consumption are in the iron works of Staffordshire, South Wales, and the West of Scotland; which, together with the lesser works of North Wales, Shropshire, Yorkshire, and Derbyshire, consume nearly one-third of the whole. The residue is consumed in smaller manufactures generally, such as those of cotton and woollen, the salt works, &c. and by the populations of large towns for domestic purposes.—*Report on Coal Traffic, by Brailheuite Poole, Esq., F.S.S.*

THE PEDLAR.

BY MRS NEWTON CROSLAND.

'Men of genius can more easily starve, than the world, with safety to itself, can continue to neglect and starve them.'—*Forster's Life of Goldsmith*.

A PEDLAR hawked his wares for sale,
Through crowded streets, o'er hill and dale,
And modestly, with gentle voice,
Arrayed them for the people's choice;
And said, 'A loaf is all I ask.
And, by the winter's fire to bask,
A roof above, and garments plain,
Express my greediest thirst for gain.'

The People turned his wares about,
And shook their heads in solemn doubt;
With tinsel goods made his compete,
Yet called his Gold a 'copper cheat.'
Then with a smile, and yet a sigh,
He said, 'Though you refuse to buy,
My wares away I will not take,
I give them—for the children's sake!'

The little children grew in time
To life's most eager, early prime;
And seeking here, and seeking there,
For wealth deserving of their care,
The youths and maidens, fair and brave,
Have found the wares the Pedlar gave.
And loud their voices now are heard,
By generous indignation stirred:—

'Oh shameful sires—to thus despise
The Poet's priceless melodies!
To tread beneath a scornful heel
The source of our exalted weal—
Celestial truths which seem to rush
O'er heart and soul, like morning's flush
In southern climes, that quick up springs,
And charms aside night's clouding wings!'

And then among themselves they spoke,
And soon one grateful feeling broke;
They cried, 'Oh, let us journey forth
From east to west, from south to north,
And take no rest until we find
This uncrowned Monarch of our Mind;
He must be old, and may be poor
Who left these treasures at our door!'

'A palace home we'll build for him,
And gold shall all his coffers brim;
Ambrosial food shall deck his board,
And nectar drinks be freely poured,
Such as like melted jewels flash;
A thousand looms shall creak and crash
To weave him raiments, fine and meet,
For winter's cold or summer's heat!'

From north to south, from east to west
They journey long, and take no rest;
Foot-sore with stony roads they've passed,
They come upon a grave at last!
A humble grave, but yet they know
The Poet's dust is laid below.
Too late—too late the wreath they've wove
To crown the monarch of their love!

Yet as they bend with reverent mien,
And pluck for relics grasses green,
A haunting voice floats through the air,
And softly cries, 'Beware—beware!
The Poet takes, to common eyes,
In every age a different guise;
Beware lest ye such Pedlar meet,
And call his Gold a "copper cheat!"'

COAL-PIT MACHINERY.

In a late article, 'Visit to Sunderland,' it was stated that the cage apparatus for descending coal-pits was not usually applied in Scotland. We now learn that the apparatus has been introduced in the west of Scotland, and are also glad to find that the ingenious application of Mr Fourdrinier, for saving lives in the event of accidental breakages of the apparatus, is coming into use amongst us.

SPORTING FISHES.

FROM the north-west point of the island of Sumatra, which forms one of the sides of the Malacca Straits, a line of islands and islets stretch several hundred miles into the Bay of Bengal. This line is broken into two series, the one being the Nicobar group, and the other the Andaman group; the islands varying in character from low flat cocoa-nut groves to lofty mountains, rising in one case—that of the Great Andaman—to the height of 2400 feet, and clothed with the majestic trees of the tropical forest. The whole of the Indian Archipelago is usually considered as the summits and plateaux of submarine mountains, continuing one of the great chains of Asia; and in like manner these islands appear to have once formed portions, now insulated by the sea, of the vast island of Sumatra, which is even now not less than a thousand miles long. The Nicobars, when viewed on the map, are comparatively small patches of land; while the Andamans, expanding in large areas, form a majestic termination of the island-continent.

These two groups, however, though so nearly related in physical geography, present the most extraordinary moral contradictions. The inhabitants of the Andamans are Oriental negroes, of dwarfish stature, with woolly hair, hideous physiognomies, and untameable dispositions; while those of the Nicobars are of the Malay race, with brown complexions, tall, well-formed figures, and minds susceptible to the influences of civilisation. It need hardly be added that these races are deadly enemies, and that the area of sea between them is the theatre of a continual war. Both live chiefly by fishing; but the Andamanians tumble in their rude canoes among the surges without ingenuity enough in their hunger to extort from nature more than a niggard meal; while the Nicobarians familiarise themselves with the secrets of the deep on which they depend, become acquainted with its inhabitants, and seduce into treachery against their kind, and bring over to their own service as agents and ministers, the very fishes themselves.

The cause of this ingenious people being driven to depend so much upon the sea, is not the scantiness of the land that has fallen to their share, for in reality their islands are in some instances of considerable size and great altitude; but the tyranny of tropical vegetation has driven them to the very margin of the water. A narrow strip of land is cleared round the sea—all else is impenetrable forest. The sun itself cannot enter these abodes of silence and gloom; and even the wild beasts, so common in these latitudes, find no harbour where there is neither light nor air. The stillness of this jungle is not merely solemn, but terrible; and it is not surprising that the imaginations of the inhabitants

of the coast should have peopled it with demons, and that their religious services should consist of sacrifices and incantations. In the year 1756 the Danes attempted a settlement on these islands, but in vain. They perished to a man before the pestiferous breath of the jungle growth; and subsequent settlers, some apostles of Mammon, and some of Christ, had not better fortune. Their domestic cattle, however, still live in a wild state on the edges of the forest; and the descendants of their swine, fed on the pulp of the cocoa-nut, are a valuable article of barter with European ships.

The natives, thus confined to the shores by nature herself, are true men of the sea. The women cultivate the strip of land between the water and the jungle, which produces cocoa-nuts, and areca-nuts, pine-apples, plantains, lemons, and other fruits; while the men give themselves up to fishing. They live not only by the sea, but in the sea. Their huts, resembling a circular rick of corn, are perched upon long stakes, and at high-water the tide flows beneath them. They are thus secure from reptiles and insects; and when they draw up their ladder at night, the solitary family sleep in safety, lulled by the murmur of the waves. Ten or a dozen such huts are congregated near each other, and form a village, presided over by a sort of chief, who has no other privilege than that of caring for the public good, and no other reward than the pride of high station. The dress of this primitive tribe is a sort of petticoat for the women, and for the men a piece of narrow cloth wound round their loins, and hanging to their heels. This last particular gave rise to the report of the Swedish navigator Kiöping touching men with tails, which Lord Monbodo confirmed by anatomical and philosophic reasonings.

But in these islands man in his amphibious habits is only an imitator of the lower class of their inhabitants—alligators, turtle, crabs. The woods are too dense to harbour tigers and other wild beasts; but the shores teem with all kinds of creatures that belong jointly to the land and the sea. The crustacea are peculiarly abundant and splendid; but the turtle is the most important to the islanders, serving as an article of barter with European mariners, whether living, or represented by its valuable shell—for all species are found here. Turtle-hunting is at once the business and pleasure of the Nicobarians; and in this department of the chase their ingenuity is exercised in a strange and interesting manner. Your turtle is a difficult customer to deal with. During the day he betakes himself to the sea, where his pasture is among the tender algæ at the bottom; and although not fish enough to remain below for any very considerable time, he requires only a short visit to the surface to recover his wind. The sea-hunter may dodge him long enough, with his spear poised, before finding him sufficiently near to present a reasonable mark; and it is only when the huge creature, tired

with flight, or sport, or the labour of diving, lays himself flat upon the surface to take a nap in the sunshine, that his pursuer has any chance. The sea at this time appears to be clear for the animal's repose. The air is silent; for the deep jungle on the land is as still as death. His soft pillow undulates with a dreamy motion; and there he lies, never thinking that the watchful man of the sea, cowering in his tiny canoe at a distance, is preparing to steal upon his slumbers.

These slumbers have been known to be so deep, that a fisherman has fastened his boat's line to the paddles of the prize, and caught—a Tartar; for the turtle, starting in wonder and alarm from his sleep, has fled like a race-horse over the surface—unable to sink—carrying with him line, boat, fisherman, and all. But even when the hunter comes prepared for his capture, and is able to strike him with his spear, the instrument may glance from the hard shell, or it may wound too slightly to do more than awaken the sleeper. The object of the spear is not to kill, but to fasten—its handle being connected with the boat by a cord; and unless it sinks deeply into the creature's back, the blow has failed. Our Nicobarian, therefore, would in most cases take nothing by his motion but the amusement of the sport, were it not for a strange ally he has contrived to press or coax into his service. This ally is a fish which he has become acquainted with in the course of his submarine adventures. It belongs to the Remora family, the same distinguished race which, according to the notion of our mariners, has given a pilot to the shark. The pilot-fish, however, so far from being the accomplice of the shark, is said by some naturalists to hunt that sea-murderer on his own account; and fastening to him by his sucker, which acts on the principle of a cupping-glass, to subsist on the juices of his body. The author of 'Memoirs of India,' notwithstanding, mentions, as a fact that had come within his own observation, that the shark, who refuses no other kind of food, will not attempt to harm this remora. Mr Wallace, indeed, saw the comparatively little creature swimming fearlessly through the monster's mouth when he opened it to swallow a bait.

However this may be, the remora of our turtle-hunter is the enemy of his friends' enemies, and is as useful in the chase as a dog, and, moreover, resembles pretty closely in figure our common *dog-fish*. He is about two feet in length, and is furnished with a large oblong sucker on the upper part of the head. To prepare him for the attack on his unwieldy prey, a long cord is attached to his tail by means of a ring passing round the root of that organ, while the other end is fastened to the canoe. The cord is plaited from the fibres of the cocoa-nut husk, which, being light, strong, and elastic, answer the purpose admirably well. The hunter, accompanied by the sporting fish, paddles slowly and silently towards his quarry, and when near enough, he directs his friend caressingly to the intended object, and sets him off at full speed, paying out the cord as he flies. The trained animal makes straight for the turtle's back, and once there, his sucker is affixed in an instant, and the affray begins. The sleeper awakened plunges in headlong terror, unable to conceive what fiend it is he is carrying on his back. But the remora no more moves than the Old Man of the Mountain, and presently a haul upon the cord informs the turtle that he is wanted up stairs. Having as little peace under water as security above, the victim soon gets exhausted, and must needs rise to draw breath, when an opportunity is afforded to the fisherman to use his dart. Turtles, it may here be observed, are by no means long-winded, as is well-known to such seamen as have been engaged in their capture among coral lagoons; for,

by keeping them in constant motion with a long boat-hook, they soon get so exhausted as to become powerless, when they may be hooked up like a stone. Although the Nicobarian is pretty secure of the game in the long-run, there is much excitement and plenty of tumult in the chase. The smooth sea is broken with the headlong paddles and the convulsive splashing of the victim's flappers; and the moral beauty and repose of the picture, like the mirrored face of the waters, are likewise shivered into fragments. The tenacity with which the remora adheres to the object on which it fixes is so great, that some knowledge is required to detach its hold otherwise than by its own special consent. The sucker must be moved in a particular direction, or the disunion can only be effected by the destruction of the fish. This tenacity of hold was strangely confounded by the ancients with general muscular strength. Thus they say that at the battle of Actium, Antony's ship was kept motionless by a remora pulling against the efforts of the whole crew; and that 400 sailors tried in vain to move the vessel of Caligula till a remora was detached from the helm.

The same sporting use of the animal was formerly made by the islanders of America, more especially those of Jamaica and Cuba; but certain periodical visitors of the Nicobars, improving perhaps on the hints obtained there, exhibit still greater ingenuity in training to their service the inhabitants of the deep. These are the Chinese, who come hither once a year for ambergris and birds'-nests. The latter, our readers know, are the production of a species of swallow, which builds in rocky caves far from the habitations of man. They consist of a gelatinous substance resembling isinglass, and only differ from the nests of some other sea-birds in being composed of this substance alone, and free from hairs, straw, feathers, &c. Their most valuable quality is said to be their innoxiousness; and yet they cost the Chinese traders with the Archipelago an annual sum of about £300,000.

The only reason we have, however, for thinking that the Chinese islanders at the northern end of the Archipelago may have taken the hint of taming fishes from the bird-nesters at the southern end, is, that nature always works upwards. The turtle-hunting of the Nicobars exhibits the rudiments of fish education, while the decoy-fishes of the Ladrone Islands are graduates in the most refined arts of civilisation. The Ladrone Islands are a line of islands which run out from the southern extremity of China, a distance of 450 miles into the North Pacific. Magellan calls them the *Islas de Ladrones*—Islands of Thieves—because the natives stole everything they could lay their hands on; but Anson describes them as being an earthly paradise. The latter navigator visited them soon after the industrious inhabitants had been expelled by the tyranny of the Spanish colonists, and before the traces of human labour had been obliterated by the impetuous vegetation of the further east. Sick of their long voyage, the weary mariners would have found any land delightful; but here, where the tropical temperature was allayed by the trade-winds, where the bread-fruit was first seen to grow, and where the fresh soil and genial climate produced all things pleasant to sight, taste, and smell, they could have imagined themselves in the Islands of the Blest. Byron next came, and all was changed. Fields, gardens, meadows, all were swallowed up in a rank vegetation that almost excluded the daylight, and this Eden of the Pacific was pronounced to be an uninhabitable wilderness. And nearly such it remains to-day, although with occasional tokens that recall its earlier beauty: lands rescued from the waste, yet bounded by overhanging woods, and here and there patches of verdure in the midst of still and lonely waters.

The islanders, like the others we have described, depend upon fishing; but their prey is far down in the quiet depths, and not of a kind to be mastered by the fierce, headlong, straightforward remora. Their capture demands stratagem rather than force; and an intelli-

gent fish, accordingly, is trained in the arts of decoy, and sent down by his master to entrap his unwary fellows of the deep. The singularity of this fact is owing to the wide line of separation there is between human beings and the denizens of an element in which man cannot breathe; but in reality there are other fishes as open to the influence of humanity as the remora and the parrot-fish. Carp come up to be fed as readily as poultry, and hold their aldermanic shoulders to be scratched and tickled, and we have no doubt would give vent to a regular guffaw if fishes were not proverbially mute. This, however, is all fun and frolic, with some self-interest at the bottom; but it is curious to notice the pride with which many of the inferior animals lend themselves to the purposes of man, more especially when these are wicked and bloodthirsty. The hawk, the dog, and the stalking-horse, are familiar instances; but none of them surpasses in sagacity, duplicity, and patience, the parrot-fish of the Ladrone Islands.

This is a great, stout, lumpy fish, with red scales—like a sharper passing himself off for a bumpkin in a scarlet waistcoat—and his mouth is shaped like a parrot's beak, which gives rise to his popular name. He is lodged by his master in a pond within the reefs, and is carefully tended and fed, and trained for the duty he is expected to perform. A hole is made in the cartilage near his mouth, and when there is work for him to do, a cord is passed through this, and he is led to the field of action. This must be on a soft still day, when Anson's paradise may be supposed to be slumbering within its circle of hoary woods. The station is on the outer edge of one of the coral reefs which almost surround the islands. The sea below is as clear as the sunny air above, and the fisherman peers from his light canoe several fathoms down into the secrets of the deep. He is provided with a large landing net, kept open at the mouth with a hoop, and to this he attaches the cord of his tame fish, and sinks all into the sea.

The intelligent animal knows what he is about; he knows that it is his business to inveigle his own kind into the net, and he acts accordingly. When he sees a brother fish worth entrapping, he rises above the mouth of the net, and makes believe that he is eating something dainty. If this will not do, he begins to bounce and play in so innocent and inviting a manner, that the stranger feels his shyness wearing off. There are pirates, however, in these latitudes, and he must mind what he is about; and perhaps Red-waistcoat overdoes his part a little, and is too vehement in his gambols. He is curious to know, however, what kind of an odd fish this is, and sails round and round him till he is fairly within the influence of the innocent-looking decoy. They determine on a game at romps, or perhaps a sham fight; but Parrot-beak pretends in his turn to have his doubts, or on some other pretext sinks down into the net. The stranger follows; they soon become friends and playfellows; and the unhappy dupe is too much absorbed in the game to observe that by some curious contrivance of nature he and his companion are rising gradually to the upper world. How can he doubt with a friend in his company so fearless and confident? Should a suspicion, however, at length cross his brain, it is too late. The net is already close to the surface; and by a jerk of the fisherman's stalwart arm, the betrayer and betrayed find themselves floundering together in the canoe.

Perhaps the moralist may find fault with the parrot-fish for his treachery; but we would suggest, in mitigation of blame, that he may himself have originally lost his liberty by the same means, and that the seductions and evil training of his human master may thus have received added force from a vague feeling of revenge against his own kind. But hold!—we are now plunging into a sea of metaphysics, not so clear as the sunny waters of the Ladrone. All we shall say further is, that the decoy-fish is stimulated by success to fresh exertions, and that he multiplies his trips to the

bottom, till the rising wind or falling shadows send the solitary fisherman home to his hut, and his faithful and intelligent ally to his tranquil pond and luxurious supper.
L. R.

THE ROSEMARY BRANCH.

It was on a fine hot day—84 degrees in the shade—that we started from the bustling Valetta (Malta) to visit that city of empty houses called Citta Vecchia. We were glad enough to escape into the open country—if I dare employ that word to designate a series of undulating fields of stones, intersected by a perfect network of white dusty roads and lanes, bordered by glaring walls. Our joy was not, as will be imagined, caused by what we found, but by what we escaped from. Valetta is a dull, handsome town, peopled, it would appear, by beggars from the Bastion Promenade to Nix Mangiare Stairs, where the sympathies of the tender-hearted are kept ever alive by awful tales of stout-looking fellows who have eaten nothing for forty days! Next in number to the mendicant herd are soldiers and guides, through a cohort of which latter we had to run the gauntlet from our hotel door to the fortifications. If Valetta contains any other classes of inhabitants, I did not see them. They remain unobtrusively at home, or glide unnoticed along the shady sides of the streets; whilst the beggars and guides surround one with almost menacing vociferation at every step. Nearly all I noticed of the city was caught in glimpses between the brandished arms and inflamed faces of these solicitors. I regretted their importunities less than I should otherwise have done, because, when the crowd opened for a moment, I saw nothing but red-coated Englishmen and kilted Highlanders.

We breathed freely when we had passed those vast moats, which I have recently seen somewhere very aptly compared to valleys; and in spite of the tremendous heat, trod it gaily down the road. Those who have never felt the influence of a dry hot climate like that of Malta, can scarcely understand the exhilarating effect of such a walk. We seemed to imbibe sunshine by every pore. Our eyes brightened, our cheeks glowed, our chests dilated, our step grew lighter and freer. The conversation was naturally without sequence; but it reflected the gladness of our hearts. Joyous sallies and pleasant anecdotes conducted us in unobtrusive forgetfulness of time, of the aim of our expedition, and even of surrounding objects, to the door of a little roadside public-house, recommended to passers-by under the attractive name of 'The Rosemary Branch.'

An open door leading into a clean-sanded parlour, that looked cool and refreshing, suggested to us the idea that we were thirsty; and we mechanically entered. There was nobody at first to serve us, and we thumped in vain upon the table. At length a soft feminine voice, with the true island accent, cried, 'Coming, sirs;' and presently a young girl ran quite breathless into the room.

'Beg your pardon, gentlemen,' said she, with a Maltese curtsy; 'but mother is putting on father's leg, which is why you were kept waiting. What is there for your service, gentlemen?'

We asked for some ale, and a bottle was soon put before us; but we had almost forgotten our thirst in admiration of the charming face of that young girl. She was dressed in a black gown, and wore the hooded mantle which makes all Maltese women look like hired mourners. But her motions were easy, graceful, and gay, and her delicious features sparkled with youth and happiness. She did not notice the attention with which we regarded her, for whilst going rapidly through all the forms of politeness which the rural hospitality of an inn requires, her thoughts were evidently far away.

'Probably,' said my companion smiling, 'the marriage-day is fixed.'

I looked at him with envy, for he felt, I thought, not

one particle of the melancholy regret, which may be a form of jealousy, experienced by some sentimental natures at beholding the bright, the pure, and the lovely, leaping with careless merriment into the turbid stream of life that is to hurry them they know not whither.

A respectable-looking old man with a wooden leg came stumping into the room to see if we were served. 'Cica,' said he, perceiving that all was right, 'go to your mother. She has something more to say to you before you set out.' Her joy, then, was caused by the prospect of a walk or a journey.

'Parbleu!' said my companion in French, a language little understood in Malta, 'the girl is glad because she is going to the great town which we are so delighted to escape from.'

'No, sir,' observed the old man, mingling with simplicity in the conversation; 'my daughter passes the week at Valetta, and she has come out to see us, as she does nearly every Sunday. Her joy, if you wish to know, is caused by the news we have given her that her brother is going to preach to-day for the first time at Citta Vecchia. She is on the point of starting to be present.'

'We are bound thither likewise,' replied I.

'Then she will act as your guide. Cica—Cica—make haste! Here are two gentlemen going to Vecchia, and they will be glad of your company. Good-by, sirs, good-by. Don't forget the Rosemary Branch.'

'Never!' said I, following Cica and my companion out into the glaring road.

The remainder of the journey was more delightful than the beginning. Cica walked with a light and graceful step between us, looking up now to one, and now to the other, and keeping alive our attention by a stream of innocent prattle. I scarcely knew what age to give her: sometimes she seemed quite a woman; at others a mere child. Her form was tolerably well developed; but she had the unimpassioned eyes of an infant—deep, blue, and limpid like the heavens they reflected.

The road, after many undulations, began to ascend the steep hill upon which the half-deserted old city stands, and we obtained wide views of the stony slopes of the island—splashed with spots of green vegetation—and of patches of the indigo sea. The majestic Valetta rose in almost magical grandeur, with its forts, and bastions, and terraces, towards the blue skies, and seemed to sparkle and tremble in the sunshine as if about to dissolve 'like the baseless fabric of a vision.' To the left, as we looked back over the garden of San Antonio, was the wide sweep of St Paul's Bay, where the apostle and his guards were shipwrecked on their way to Rome; to the right, our view extended sometimes as far as the populous Casals of Tarxien and Zeitun.

The scene, as I have said, possesses few of the charms which vegetation gives to a landscape. The imported soil of Malta is scanty and hungry, the trees are stunted, and the herbage is gray and parched; but here and there, in some more favoured spot, down at the bottom of some zig-zagging valley, or on the well-irrigated northern slope of some hill, were bright emerald streaks or patches, showing in gay contrast to the stony expanses around. Besides, the sun and the sky seemed to throw down vivid colours on every object, and to bathe the whole island in a kind of dancing glow of light, that collected in particular intensity round the numerous Casals, each with an imposing church, that stud this extraordinary island.

We did not stop often, for Cica pouted at every moment of delay, and threatened to run away and leave us. There was no resisting her; she led us as if by a string. Even my matter-of-fact companion, who professed to be proof against the magical influence of beauty, puffed bravely up the steep road in his endeavours to serve the impatience of little Cica, who on her part did not seem disposed to quit us.

'You must hear him preach,' said she. 'He is so pretty: it will be very amusing.'

These words, which filled us with surprise, were scarcely out of her mouth when a buzz of small voices attracted our attention, and a crowd of rosy little beggars, showing a vast number of pearly teeth, came dancing round a corner, singing out the eternal 'Nix mangiare!' (Nothing to eat). It was a flood of fluttering curls, chubby faces, and tiny hands, that rose not much higher than our knees. Cica, who seemed well known to all these urchins, tried to look tall and grand; but a sturdy little ruffian, about two years old, toddled up to her, and familiarly caught hold of the skirts of her gown; a girl, just escaped from the cradle, hung on by the tail of her mantle; another leaped up to seize her hand—all vociferating the comical falsehood, 'Nix mangiare—nix mangiare!' Cica could not resist the appeal, and after distributing two or three smart boxes on the ear to the most uproarious, began to search her pockets for some small coins. We came to her aid, and soon succeeded in satisfying the merry group of infantine mendicants.

We were assailed by older applicants a little higher up. 'Ought we to give?' said I to Cica.

'To be sure,' she replied, looking surprised; 'if you can afford it.' We were indiscriminately generous, and were rewarded by an approving glance.

'It strikes me that we cut a sad figure for two political economists,' whispered my companion, wiping his streaming forehead. 'I am afraid that one of us is in love with Miss Cica!'

We did not determine which, but followed our charming little guide through the gates of the city, and were soon moving along a labyrinth of cool, shady, and deserted streets. I now asked Cica why she expected the sermon to be amusing, and why she told us that the priest was pretty? The only answer was a silvery laugh, and an injunction to make haste.

'She is poking fun at us,' said my companion.

I scouted the heretical idea, for I had already invested my Cica—the word is written; let it stand—with well-nigh every virtue under heaven, frankness especially. It would have cost me too much to believe that this child-woman was keen enough already to divine the impression she had produced, and heartless enough to make it a subject of sport. The good and the true never receive respectful admiration but with gratitude.

We walked behind her, sadly resigned; for she seemed no longer to have any thoughts to spare for us. Her whole soul was projected forward to taste by anticipation her brother's triumph; for it was evidently in a worldly point of view that she regarded the matter. The performer was to be 'pretty'; the performance 'amusing!'

On arriving before the gate of the Jesuit's College, Cica made a gesture of farewell, and glided hastily beneath the sombre archway. I confess that I was not prepared to part in this manner, though what other parting could I have expected? She had waved her hand, had thrown a too impartial smile towards us, had rested her golden glances upon us for a moment, and had disappeared. Words could not have expressed her sentiments better. But still, I know not why, when I saw her dark, little form melt like a shadow in the distance, a feeling of solitude came over me—something akin to that of a child abandoned in a gloomy wood by its mother. As my companion drew a long breath, which might be called a sigh, I supposed that he shared my impression.

We learned from the porter that Padre Esmonde, the superior, was engaged for the time; but Father Connell, a pale, ascetic-looking personage, who happened to pass, gave orders to conduct us to the chapel, where service was going to commence. They led us through a garden filled with ladies from Valetta, among whom our eyes in vain sought for Cica, and through a series of vast echoing halls and corridors and staircases to the chapel, fitted up with the luxury of ornament common to Ca-

tholic places of worship. It is unnecessary to describe the ordinary ceremonies; but judge of our surprise when we saw a boy, a child of not more than eleven years old, dressed out as a priest, and preparing to address the congregation! We now understood that in this college, probably in order to give them a taste for a holy vocation, the pupils, either in turns, or as a reward of merit, actually perform the part of priests in a consecrated building. On this occasion Cica's brother, after having blessed the assembled people, delivered in Italian an impassioned oration, consisting principally of fervid addresses to the Virgin Mary. Nothing was wanting to render the exhibition complete. He now clasped his hands—now pointed to the cross, and the images, and the paintings around—now appealed to the altar, illumined in broad daylight with a row of pale tapers. He was a remarkably clever boy; but the whole scene was a disagreeable one. The parody of a solemn ceremony is never pardonable.

I thought sometimes of the innocent joy which Cica must experience at beholding her brother dressed out so finely, addressing so imposing an assembly from so commanding a position. How 'pretty' he must have appeared to her; how 'amusing' must have been the scene! If her mind reverted at all to us, it was doubtless to represent us in ecstasies at this wonderful performance, probably the most interesting she had herself ever witnessed.

We rapidly examined the general arrangements of the college—which, in a sanitary point of view, are admirable—and then took a quiet stroll in the garden. Our principal talk was of Cica, whose charming face we sought beneath every black hood that passed; but though we saw many bright eyes, we saw none so bright as hers. There was no face like her face, no form like her form, no step like her step!

'We must take care,' said my companion, 'not to repeat her name too often, lest we be overheard. The evil-minded are always ready to misinterpret. Let us call her by the name of her father's house—the Rosemary Branch.'

I looked at him, and envied him the delicacy of this idea. He had been slower to move, but was perhaps more deeply moved than I. Already his unacknowledged passion suggested to him to spare an unspotted reputation: he would not allow the breath of rumour to visit her cheek too roughly; the tendency which we all have to isolate the objects of love was developing itself. Any other expressed admiration than mine would probably have seemed a profanation.

So we called her the Rosemary Branch, and she bears that name in our memories even to this day.

We dined at a small inn whither we retired for an hour or so, more to unburthen our hearts in quiet than incited by hunger, and towards sunset went to pay our respectful adieus to Padre Esmonde. That urbane old gentleman shook us cordially by the hand, and showed us to a carriage he had purposely engaged for us. The politeness, considering that we were perfect strangers, was too great to be rewarded with thanks: we showed our sense of it in our manner.

The sun was setting in a purple mist as we rolled gently out of the gates of the hushed city; the sky was immaculate from horizon to horizon; all sorts of fugitive hues were spread over the weary landscape; nature, relieved from the torturing glare of day, seemed to be sinking precipitately into repose; the shadows hastily thickened under the thin branches of the trees; the gulleys began to look dim and gray before the purple and the gold had ceased to tremble on the crests of the hills. I remember being struck by the silence as we descended the hill. One or two lingering beggars, however, who kept in mind our bounty of the morning, saluted us with a cheerful 'Addio!' as we passed; a cow that toiled with steaming back up the steep lazily tinkled its bell; the waters of a half-dried fountain fell in large minute drops into a broken basin; and a man who wandered upon a distant slope drew long melancholy sounds from a reed

pipe. We reclined listlessly back in our seats, inhaling the perfumed breath of evening, and cherishing the prolonged vibrations of the sentiments we had both experienced that day. Suddenly a small voice that startled us, like a summons from the other world, was heard. The Rosemary Branch waved upon a mound by the roadside.

'I was told,' she cried merrily, 'that there was a carriage prepared to take you back; so I ran forward here to ask you for a help to Valetta. It is getting late, and it may not be good for me to be on these lonely roads at night. I am sure my good friends of this morning will excuse me.'

We answered by desiring her to leap in. Each held out a hand to help her, and in a moment there was she, to whom we had already bidden an eternal adieu in our hearts, sitting before us in the expiring light of evening; her long robes rustling amongst our feet; her hood thrown back, so as to allow the fresh breeze to play with the ringlets that clustered round her neck. I never shall forget that form as it appeared looming through the cold twilight; its ineffable loveliness softened down; its reality, as it were, almost effaced by the sober influence of the hour; dim as an old picture, as a friend seen in a dream, as the recollection of the dead that have been replaced. I could have travelled with it round the world!

But the journey was short, though Cica found time to relate to us a good deal of her little history: as how her father was a retired sailor with a pension, and how he still laboured only for his children's sake, and how he called his wife Admiral, his daughter Limpet, and his wooden leg Tom Tough.

'And what does he call his son?' inquired I.

'He calls him Antonio,' she replied gravely; thereby implying that the precocious learning and talent of the boy protected him in that rude but genuine circle from the familiarity of a nickname.

It was quite dark when we pulled up at the Rosemary Branch; but the worthy old host was smoking his pipe at the door by the light of a flickering candle, whilst the Admiral was looking anxiously down the road for the expected one. We were invited, with disinterested hospitality, to enter; but Cica, after giving a brief but vivid account of Antonio's success, insisted on proceeding at once to Valetta.

'Her heart yearns for some one,' thought we simultaneously—for each pressed the other's hand. The remainder of the drive elapsed in almost awkward silence. We on our part felt the anticipated anguish of a separation, in the form prescribed for the breaking-up of a day's acquaintance, whilst we could each have taken her in our arms, and bathed her chaste brow in our tears. She, with the magical intuition of sentiment, seemed to have at length discerned that something more was passing in our minds than what was trusted to our lips. All three made attempts to stir up the flagging conversation, but in vain; and not a word had for a long time been uttered, when we rolled beneath the dreary echoing tunnel that leads through the fortifications.

'It is like going into a tomb, my friends,' said Cica in a solemn voice as she drew shuddering closer to us. We have commented on the expression a thousand times, and interpreted it in a thousand different manners. The sombre comparison was most likely in unison with the other thoughts that occupied her mind. If so, we have the satisfaction of thinking that whilst Cica understood us, she was not offended by our involuntary admiration, and felt an instinctive regret as the hour of parting drew nigh.

The carriage stopped before a large tranquil-looking house in the upper part of Strada Stretta. Scarcely had the wheels ceased to roll, when the door opened, and a bright light streamed forth. The first object I saw was a fairy little head, with scattered curly hair high up towards the lintel. It was a laughing child astride the shoulders of a tall, handsome-looking young man: a

buxom serving-girl held a candle. All three looked eagerly forth.

'Whose is that delightful child?' exclaimed I, anxious to say something at parting.

'It is mine—mine!' she answered with a burst of maternal pride and a glance of gratitude; 'and this—laying her hand with triumph on the young man's head—this is my husband, the Sculptor Minotti.'

The double glories of wife and mother descended upon her as she spoke, and years seemed to thicken round her youthful brow—the girl ripened into the woman before our eyes. Yet we cannot forget the original impressions of that day. Until now, at least, the Rosemary Branch blooms fresh and lovely in our memories, and our sweetest thoughts cluster beneath its shadow. May it never wither; for there is no better legacy to old age than the pure traditions of youth!

THE SCIENCE OF ART.

THE hypotheses which refer Beauty to association of ideas and to expression have been confuted by abler pens than ours; and those which compose it of proportion, expression, colour, and other elements—even when they make proportion the chief constituent part—are, in our opinion, equally erroneous. The cause of such mistakes, as we have elsewhere surmised,* is a certain restrictedness of view, which has not yielded even to the inspiration of the subject, but which confines the beautiful within the circle of our common wants and instincts, and sees in it only the source of sensuous gratification. The same thing, however, is observable even in inquiries of a strictly experimental nature; and thus the superstitions of the Philosophers' Stone and the Fountain of Youth governed the pulses of philosophy throughout the entire world till comparatively recent times.

The conceptions of the elder Greeks regarding beauty were nobler than ours, and for that reason their art was of a loftier character. Their beauty was divine, not human; intellectual, not sensuous; and, like the Jews and Persians, they sought in the loveliness of the human form a type of the perfections of the Deity. A satyr peeping under the drapery of a sleeping goddess—this is a parable of ignorance and misapprehension on one side, and truth on the other. In the one figure there is an uninformed nature misapplying the divine to the objects of its own vulgar instincts, and in the other reclines the divine itself, untroubled and unconscious, in pure, silent, and passionless repose.

Expression, colour, fitness, association of ideas—all these, singly or united, may excite human love; but all these may and do exist without beauty. They are the talisman concealed in the hair of a hideous slave, which made her an object of passion to an accomplished prince. When the talisman was removed, he turned away in disgust from the woman he had worshipped; and even so does love fly with the qualities that inspired it. But if, instead of deformity, beauty should remain—would love, think you, linger after expression had changed, after bloom had fled, after fitness was lost, after associations were destroyed? Assuredly not. But in this case love would be replaced by admiration; the taste would worship instead of the heart; while the affections would fly away in search of a new object whereon to lavish their devotion. Beauty, then, is not a thing of the passions, but of the intellect; it does not belong to sex, or age, or race, or country; it is universal and divine; it is incapable of tarnish or desecration: the 'beauty of holiness' and 'beauty of God' of the Hebrew

prophets are better imaged in the heathen deities of Greece than in the pictured saints of the Roman church.

Winckelmann has ably described the singular concurrence of circumstances which aided the Greeks in their search after beauty; but he has omitted to give due weight to the lessons they learned in Egypt. It was thither their students went, before the golden age of Pericles, to be initiated in sculpture; and sculpture, it must be remarked, depended with the Egyptians entirely upon *proportion*, for their genius did not lead them to attach any importance to grace and embellishment. This fundamental part of art was known likewise to the Hebrews; and the following passage in Isaiah, who lived between 700 and 800 years before the Christian era, describes the process in his time of making a wooden statue:—'The carpenter stretcheth out his rule; he marketh it out with a line; he fitteth it with planes, and he marketh it out with the compass, and maketh it after the figure of a man, according to the beauty of a man; that it may remain in the house.' The materials, it is added, were cedar, cypress, oak, and ash. This passage, which we have never seen quoted in reference to the subject before us, would seem to imply very distinctly that there was a science of proportion which enabled the sculptor to produce the likeness of a man, independently of the art which taught the refined and accomplished Greeks to endow it with poetical life. The purpose of the prophet is to ridicule the folly of the idolators who made a fire to warm themselves, and a god to worship, from the same material.*

That the science of proportion was known to, and observed by, the Greeks, and that it played an important part in their achievement of ideal beauty, receives corroboration from various circumstances. One of these was mentioned in our former article—the precise similarity of the various statues of each deity; a similarity which could hardly have occurred in the case of works executed by different hands, and at different times, unless through the agency of known geometrical rules. Another is the magical repose of their sculptures, which led Dr Knox to suppose that beauty consisted in the concealment of the inner integuments of the body. We accounted for this repose by the manners and habits of the people;† but as regards high art it had a deeper cause—namely, the necessity for preserving intact the symmetry of beauty. This necessity was lost sight of in modern Europe, even by the best Italian artists. In the illustrations, for instance, to Leonardo da Vinci's treatise on painting, now lying before us, the starting out of the muscles, in the constrained attitudes of the figures, is a momentary violation of the law of proportion, and the taste unconsciously resents the interruption. The statue of St Bartholomew, which we have seen in the duomo of Milan, representing the saint after he was flayed, with his skin hanging over his shoulder like a quantity of old clothes, is not so repugnant to the feelings; and the reason is, that the attitude of the figure is tranquil, and the denuded muscles therefore in their normal state. We now come to another and much more remarkable corroboration, which calls upon us to introduce to our readers one of the most valuable and original contributions that have ever been made to the philosophy of art.‡

There is a remarkable difference in the general form

* 'He burneth part thereof in the fire; with part thereof he eateth flesh; he roasteth meat, and is satisfied: yea, he warmeth himself, and saith, Aha, I am warm, I have seen the fire: and the residue thereof he maketh a god, even his graven image; he falleth down unto it, and worshippeth it, and prayeth unto it, and saith, Deliver me; for thou art my god.'—*Isaiah*, chap. xlv.

† The analogy between Greek poetry and Greek sculpture is perfect. See the article 'Landon's Poetry,' in the last No. of the *Edinburgh Review*.

‡ On the Science of those Proportions by which the Human Head and Countenance, as represented in Works of Ancient Greek Art, are distinguished from those of Ordinary Nature. By D. H. Hey, F.R.S.E. Edinburgh and London: Blackwood. 1849.

* 'Ideal Beauty,' in No. 330.

of the head, and in what is more especially obvious, the facial angle, between the human race and the inferior animals. The same difference exists, though in a less degree, between the various tribes of mankind, and between individuals of the same tribe; and it is observed as a general rule, both in animals and men, that the ratio of intellect is in proportion to the approximation of the plane of the face to a vertical line. Nature seems to proceed with effort, either to reach some standard of perfection prescribed by the Great Architect, or to recover some status lost at the introduction into the world of sin and wo. But *where* are these efforts to stop? *What* is the standard to be attained? In the living model the angle is seen at eighty degrees, and in high art at a *hundred*!—in other words, the nose in the latter is merely a projection of the line of the forehead, and both are parallel with the spine. Why should this difference exist between nature and art? And why should it exist among a whole nation, and to precisely the same degree? The inference is, that the Greek artists took their features from life, but composed them according to geometrical rule; and that this rule gives the line determined by nature, is shown in the fact, that the sculptures so produced some thousands of years ago remain to this day unapproachable in beauty. Mr Hay, in reference to the strangely unsettled state of so interesting a question, quotes the opinion of Hazlitt, that the Greeks found among themselves the beauty of their statues; and that of Haydon, that they were mere men like ourselves, and neither larger nor handsomer. But we would remark, that if beauty had really been common among the ancients, it would not have been exalted, as it was, almost to an object of worship; just as in like manner, if knowledge had been generally diffused among the fair sex, the few accomplished women whose names have come down to us would not stand out, as they do, like personages of history. Nature, however, we always repeat, works upwards, unless disturbed in her course by repelling influences. There are finer women in England to-day than those who graced the court of Charles II.; and Byron's Maid of Athens, described with so much unction in the travels of Mr Hugh Williams of Edinburgh, would have had altars erected to her in the days of Pericles.

Dr Knox, the latest writer on the subject, asserts that art preceded all theory; that the beautiful was discovered and chiselled by those who were ignorant of geometry, of the doctrine of harmonic proportions, and of anatomy; and that the artist, from the observation of living forms, was led on by inspiration to the scheme of nature. When he, however, and the other opponents of the geometrical theory, assume that the facial angle, which is not known to have been as yet attained by nature, was hit upon by the Greeks by the mere inspiration of genius, they forget that the question does not regard a single artist, but several successive generations of a whole people, politically divided into separate and exclusive states. Genius, we may venture to say, without running any risk of being condemned for the dogmatism, does not dispense her inspirations in this wholesale manner. A discovery in geometry may be communicated at once to a whole nation of geometrists; but an example set to the unlearned by one or more men of genius will be followed only partially and gradually. 'That the inspiration of genius, combined with a careful study of nature,' says Mr Hay, with the diffident yet earnest spirit which characterises his labours, 'were essential elements in the production of the great works which have been handed down to us, no one will deny; but these elements have existed in all ages, whilst the ideal head belongs exclusively to the Greeks of the periods of Pythagoras and Plato. Is it not, therefore, reasonable to suppose that, besides genius and the study of nature, another element was employed in the production of this excellence, and that this element arose from the precise arithmetical doctrines taught in the schools of these philosophers?' Mr Hay might have added that the artists, the great men of their age,

the dispensers of fame, the familiars of the gods, and the pride and boast of their country, could not possibly have been ignorant of the little learning of the age. The science they were taught they must have applied in aid of the art they studied; and it is the object of Mr Hay's dissertation to determine the principles of proportion thus deduced.

Before coming to his theory, however, which seeks the laws of proportion in what would seem a very different matter—the laws of musical sounds—we would remind the reader of the wonderful simplicity of nature, and the extreme paucity of the elements she works with. It was formerly supposed, for instance, that the nerves of sensation were acted upon by different agents in the transmission of what belongs to each to the seat of consciousness; but we are now aware that the same electric stimulus produces in the eye the sensation of light, in the ear that of sound, in the nerves of feeling that of a shock, &c.* In the same way a distinction was drawn between light and sound; the former being supposed to result from infinitely minute particles of matter impinging on the optical organ, and the latter from its quality of producing vibratory motion. All this, however, has been overturned by modern science; and light as well as sound is known to arise 'from the infinitely rapid vibrations of bodies in their molecular structure, propagated through an extremely elastic medium.' Pythagoras had possibly no precise notions of this law; but he established a mystical connection between music and what are called the exact sciences (as if any were inexact), teaching by the former a knowledge of spiritual things, and imagining a harmony which regulated the course of the stars; and applying geometry to the explanation of things cognisable by the senses. The laws of melody (or musical proportion) were studied then and afterwards simultaneously with the laws of mathematical proportion. The age of Pericles was not remarkable for its sculpture alone: it was likewise the golden age of music. It was Pericles himself who built the Odeon, and instituted the musical contests at the Panathenian festival. The music of this time, derived originally from the lofty and religious strains of Egypt, retained a severe and heroic character, till the introduction of the softer Phrygian and Lydian styles—vainly banished by the impassable Plato from his ideal commonwealth.

We cannot do more, in a popular work like this, than give a very general notion of the manner in which Mr Hay traces the laws of proportion to the fundamental laws of harmonic ratio; and indeed it would be impossible for us to proceed further without the aid of such diagrams as enrich his own work. The vibrations of the monochord, however, are the basis of his theory; and by the aid of this simple instrument he appears to have solved a problem which has long been the despair of the learned world. Even Sir Isaac Newton, as Mr Hay mentioned in a paper he read recently to the Royal Society of Edinburgh, expressed his belief in the operation of the laws of numerical harmonic ratio in the composition of beautiful forms, although he did not attempt to explain the principle. 'I am inclined,' says the great astronomer in a correspondence on this subject with Sir John Harrington, 'to believe some general laws of the Creator prevailed with respect to the agreeable or unpleasant affections of all our senses; at least the supposition does not derogate from the power or wisdom of God, and seems highly consonant to the simplicity of the microcosm in general.' Mr Hay's plan is simply to form a scale composed of the well-known vibrations of the monochord, which are the alphabet of music, and then to draw upon the quadrant of a circle angles *answering to these vibrations*. With the series of triangles thus obtained he combines a circle and an ellipse, the proportions of which are derived from the triangles themselves; and thus he obtains an infallible rule for the composition of the head of ideal beauty.

* See Journal, No. 323, article 'Sensation.'

The divisions of the monochord which produce the common chord (the 1st, 3d, and 5th of the musical scale), when applied to the quadrant, give the three angles which alone are necessary to impart proportion to the head. The work before us goes no farther than the head; but the author is employed upon another, giving the proportions of the whole figure by the same rule; the division of the quadrant being continued as far as ten angles, and these arranged upon any given straight line representing the full length of the figure.

It might seem at first sight, to persons unacquainted with geometry, that this rule would apply only to a single figure, but in reality it is susceptible of infinite variety. Müller, in his 'Ancient Art and its Remains,' approaches the problem pretty nearly; but he stumbles at the difficulty of the application of any general rule to particular forms. 'The principles,' says he, 'which the ancients followed in regard to proportions (*symmetria numeris*)—and we know that this was a main object of artistic study—are naturally difficult to discern and determine, on account of the manifold modifications introduced by the application of them to different ages, sexes, and characters.' Now, the effect of Mr Hay's discovery is precisely to obviate this difficulty. The governing angle which produces a perfectly-formed woman is more acute than that which produces a perfectly-formed man; the governing angle of a Hercules is more obtuse than that of an Apollo: but in both figures the proportion deduced from these angles is fixed and inviolable. In removing this difficulty, however, Mr Hay does not pretend that his mechanical rules can take the place of genius. He merely presents a vantage-ground to genius for its flight; and where his science ends, high art begins. 'I beg the reader,' says he, 'to keep in mind that I confine myself to such variety as belongs to the permanent form of the anatomical structure, knowing that to impart the variety which results from the action of the muscles, and gives sentiment and expression to the countenance in obedience to mental impulses, requires the highest efforts of genius, and consequently belongs to a branch of art beyond the scope of a treatise the sole object of which is to point out the primary laws of geometrical harmony from which the countenance derives the beauty of its proportions.' It is manifest that the former modes of measuring by so many lengths of the foot, face, &c. can give, compared with this, but a very rude and unsteady approximation; and that the application of the laws of numerical harmonic ratio to the practice of the artist, would impart to his works a more scientific character than they at present possess, and so far from confining the efforts of genius, would tend to facilitate and assist them. 'Our schools,' says Mr Hay, 'instituted for instruction in the arts of design are conducted without reference to any first principles, or definite laws of beauty; and from the drawing of a simple architectural moulding to the intricate combinations of form in the human figure, the pupils have to depend upon their hands and eyes alone, servilely and mechanically copying the works of the ancients, instead of being instructed in the principles upon which the beauty of those works depends. The instruction given in these schools is addressed almost exclusively to the senses, without reference to the judgment or understanding of the pupils; and they are thus made to study and imitate effects without investigating causes. Doubtless men of great genius sometimes arrive at excellence in the arts of design without a knowledge of the principles upon which beauty of form is based; but it should be kept in mind that true genius generally includes an intuitive perception of those principles along with its creative power. It is, therefore, to the generality of mankind that instruction in the definable laws of beauty will be of most service, not only in improving the practice of those who follow the arts professionally, but in enabling all to distinguish the true from the false, and to exercise a sound and discriminating taste in judging of artistical productions.'

If Mr Hay is allowed to have solved the great pro-

blem of art, he must also be allowed to have set at rest the question respecting the facial angle of the Greek sculptors, which Dr Oken and others declare to be *unnatural*. This ideal beauty must be the point to which the efforts of nature are directed; otherwise the identity of its proportions with the science of acoustics must be a delusion. This ideal beauty must be the true natural beauty, to which mankind will advance with advancing knowledge and civilisation. 'In regard,' says Mr Hay, 'to this *original* perfection in the form and proportions of the human head and countenance—for such I conceive it to be—innumerable causes have operated, and do still continue to operate, on the one hand, in degrading it, and, on the other, in counteracting this degradation; and to these operations may be attributed that endless variety of countenance by which nations, classes, and individuals are distinguished. Amongst such causes, the effect of climate, and, still more, the degree of civilisation under which a people is trained, seem to be the most effective. There can be no doubt that all the features are affected, to a great extent, by continual exposure to excesses of heat or cold; but their character is more permanently formed by the degrees of moral restraint, as well as by the privations and toil induced by the state of society. In savage life, on the one hand, the want of mental cultivation, and the consequent dormancy of the reasoning powers, must ultimately rob the countenance of its inherent capacity for intellectual expression. The modes also by which the means of existence are procured, along with continual exposure to the inclemency of the seasons, must produce a permanent expression of mere animal desire, and even in some cases of brutal ferocity. In civilised life, on the other hand, the employment of the higher faculties of the mind, agreeable occupations and amusements, refined modes of supplying the wants of nature, and the protection afforded from the inclemency of the weather, must all conduce towards regularity of the features, and impart to the countenance a permanent composure and serenity. As the passions by which the mind is thus moved, and the modes in which the wants of nature are supplied, act upon the muscles of the face, in giving them an enduring character, so must these muscles, in course of time, act upon the bones to which they are attached, producing a permanent effect upon the structure of the skull, which ultimately becomes hereditary in nations and classes. Hence the protruding jaws and high cheekbones of savage tribes, as compared with those of the more civilised races of mankind.' In illustration of this theory, he shows in a series of plates the process by which the anatomical structure geometrically changes from the most perfect development of the science of proportion, as exemplified in works of ancient Greek art, down to the most imperfect of ordinary nature.

In former works, Mr Hay has applied the harmonic theory to colour and form.* As the three fundamental notes of music, the 1st, 3d, and 5th of the scale, when sounded consecutively, produce the common chord, the foundation of all harmony in musical composition, so in chromatics, the three original colours, blue, red, and yellow, form the triad from which arises all harmony in painting. The same analogy is visible in form, where the circle, triangle, and square, being the three simple, primitive parts, give rise, in mathematical proportion, to all the varieties of beauty that delight the taste. In the works referred to, these ideas are illustrated by ingenious diagrams, without which, the system to unscientific readers would appear intricate and mystical.

It will be observed that a suspicion, and in certain instances a belief, in the existence of some hidden analogies of the kind existed long before the present day. Mr Hay's discovery, therefore, consists in the geometrical expression of these analogies—in the numerical

* *Laws of Harmonious Colouring*, 6th edition. 1847. *The Natural Principles and Analogy of Form*. 1842.

value, so to speak, of the relations that exist between the harmonic scale and form, colour, and proportion. He assumes to have brought to light the hidden truth, to have stripped it of its vagueness and mystery, and to have presented it with a scientific exactness and simplicity which, if it is once fairly recognised and established, must exercise a prodigious influence in every department of art, and bring the hitherto unattainable idealism of Greek beauty within the reach of modern genius. On this consummation Mr Hay will be admitted to the chief rank in the procession of æsthetical inquirers.

BENEFIT BUILDING SOCIETIES.

MANY start at the word socialism in our day, without knowing, or at least without remembering, that there is an equitable kind of it in vigorous existence and progression amongst us, with the entire approbation of all rational persons. Whatever is to be the fate of this principle in its pretension as a mode for the distribution of the products of industry, it is certainly found highly efficient in the meantime for protecting individuals against many of the direr casualties of life. The most remarkable example of this is afforded by the insurance companies, which guarantee their members, to a modified extent, against the casualty of fire, and their families against the physical evils that follow in the train of death. The dwelling of a man who lives up to the last farthing of a confined income is burned to the ground, and its furniture utterly destroyed; but instead of being irretrievably ruined by the misfortune, he merely takes another house, and furnishes it anew with ready money. The father of a family dies without a shilling in his possession, and his income perishes with him; but his widow and children, instead of sinking to the workhouse, have a capital wherewith to continue alone the battle of life. And how do these things come about? Neither by magic nor by charity, but by the simple means of social co-operation. The timely fund is raised for our neighbours upon no principle of generosity or humanity, but by the mere fact of our taking steps to secure for *ourselves* the same benefit when wanted. In like manner ships are insured, as it is called, against the dangers of the sea; and even limbs and lives against the casualties of a railway journey; and the insurers exercise these kinds of benevolence as a business speculation, and usually find that their virtue, even in a pecuniary sense, is its own reward.

Such applications of the principle are not new in point of time, yet they are only slowly making their way among the people. Life insurance, in fact, has not yet come down to the poor; for to them it would be too complicated an affair, since the amassing of the premium even on L.100 (a magnificent sum to them) would require a separate and distinct prudential process. The numerous other schemes, however, at present in full operation, proportioned to the slenderness of their means, and adapted to the almost universal system of weekly wages, proclaim that the principle of co-operation is understood. Not to mention savings' banks, which are on a different footing—friendly societies, burial societies, clubs for assistance in time of sickness, or want of work, benefit companies of all kinds, attest that the people are awake to the practicability of the great plan of helping themselves by helping one another. Some of these associations, however, are insecure; some waste more in time than they pay in profit; and most of them, leaning upon the base public-house system, turn the very prudence and foresight of the poor into allies of their vices.

Benefit Building Societies are distinct from those we have named. Their object is highly important; their sphere embraces almost all classes of society; and they have taken so strong a hold upon the imaginations of the people, that, rapid as their progress is, it is difficult to say where it will stop. The idea, we are told by a work* which may be considered as the grammar of the system,

was first developed among the people of our own section of the island.

The first Building Society which can be traced was founded in 1815, under the auspices of the Earl of Selkirk. It was a village club at Kirkcudbright in Scotland. Other institutions of a similar kind were afterwards [previously] established in the same kingdom under the title of "Menages," and the system was soon adopted in England by societies formed in the neighbourhood of Manchester and Liverpool, and other parts of the north. After the year 1830 they increased so rapidly, that on the 14th of July 1836 a special act (6 and 7 William IV. cap. 32) was passed for their encouragement and protection, in the provisions of which were embodied certain clauses applicable to their conduct, which were included in the statutes relating to friendly societies passed in the reigns of George III. and George IV. As a proof of their numbers, it may be stated that, up to the 31st December 1848, there had been registered in the United Kingdom upwards of 2000 societies, of which in England alone 160 were added during the past year—a similar increase having taken place in Scotland and Ireland. Of these societies there is evidence to show that from 800 to 900 are yet in existence, the total income of which is calculated at not less than L.2,300,000 a year. In fact there are two or three of them whose annual incomes are between L.50,000 and L.60,000 each.

The theory on which a Building Society proceeds is very obvious—after it is pointed out. Say that A pays B L.20 a year for a house of the value of L.300. At the end of fifteen years A has laid out L.300, with a certain additional sum by way of compound interest, and he is no more the proprietor of his house than at first. Suppose, however, that B was willing to have sold A the house at first at L.300, and to have taken the price in annual instalments extending over fifteen years, a mortgage on the property meanwhile being his security. In this case A pays L.20 yearly as a part of the price, and interest at (say) 4 per cent. on the sums remaining unpaid, till the whole is cleared off. We here set aside the annual L.20 as being a price for the house, and we then find that, at the end of the fifteen years, A has been his own tenant at a rent represented by the interest on the sum unpaid, together with the value of the aggregate money laid out at compound interest. Thereafter he continues to be his own tenant at the amount of the interest on L.300, which of course is considerably less than L.20. He is a gainer on the whole transaction, by the difference between the return for money laid out on house-property which is generally from 6 to 7 per cent., and that for money laid out at interest, which is seldom above 4, except in circumstances inferring risk.

To become proprietor of one's own house, by paying annual instalments of the price, is obviously a convenience to many persons in limited circumstances. So is it likewise to have a house built for them, that they may commence occupying it. Now it is of no consequence whether the house be provided by a proprietor or builder called B, or by a combination of many A's, who, clubbing their various sums of L.20 yearly, cause a certain number of houses to be produced yearly, until all have been provided. It is only doing that by social means which is usually done by individual efforts. Hence arises the Building Society. The economy of being a house-proprietor is approximately like that of being the proprietor of one's furniture. On entering upon housekeeping, no prudent man, if he can possibly help it, thinks of hiring furniture, well knowing that the hire amounts very soon to the whole value; and yet, says a writer in the 'Building Societies' Record,' how many thousands of persons there are in the metropolis only who deem it an unwise extravagance not to purchase their articles of household furniture, and yet are quite content to hire their houses! What numbers occupy hired houses or apartments to deposit their unhired furniture in!'

A Building Society is described by Mr Scratchley as a kind of joint-stock company, into which the members pay a trifling sum periodically, according to the number of their shares. It is usually composed of two classes of

* A Treatise on Benefit Building Societies, &c. By Arthur Scratchley, M.A. London: J.W. Parker. 1849.

persons—those requiring houses, and having that object in view solely; and those who merely wish to lend their spare money to the concern, with the view of its being ultimately returned to them with interest. The payments of the first class—called Borrowers—are so calculated as to enable them to repay by equal monthly or weekly instalments, within a specified period, the principal of the sum advanced to purchase their house, with whatever interest may be due upon it, throughout the duration of the loan. The Investors, as the other class are called, receive at the end of a given number of years a sum equivalent to the amount of their payments with compound interest accumulated upon them. The money thus accumulated is lent out to members desiring advances, and the interest raised making fresh capital, is employed in the same way, again and again, so as to be constantly reproductive. Most of these societies are terminable at the end of a fixed number of years; but the general feeling among persons acquainted with the subject seems now to be, that this is an improper arrangement. Various reasons are given for the opinion, but a single conclusive one is as good as a thousand. This is, that in such a society—say one terminating at the usual period either of ten and fourteen years—the opportunity for investment soon ceases. At the beginning of the term a man might be willing to engage to pay L.30 a year for fourteen years on a corresponding loan; but if only six years of the duration of the society were unexpired before he joined it, he might find L.59, 18s. a year highly inconvenient; and if only four years, L.85, 12s. 6d. a year quite out of the question. In the latter years of the society the business would be at a stand; or if any transactions were made at all, it would be with that wealthier class who are in little need of such resources. In the case of societies terminating in ten years, the evil would of course be greater; and we need scarcely remark that a cessation of business is equivalent to a loss, the calculations being based upon the supposition that all the monies received from subscribers are continuously invested until the winding-up of the concern.

We shall not follow Mr Scratchley closely in his section relating to 'societies on erroneous principles'—which unfortunately form a very great proportion of the existing societies. Several *hundreds*, for instance, proceed upon the plan of L.120 shares, and 10s. monthly payments, for 10 years. That is to say, an investor who pays 10s. per month—L.6 a year, equal to L.60 for the whole term—is entitled, at the end of the 10 years, to L.120. To realise this profit to the society, the borrower is required to pay for his advance only 7 per cent.—being just about one-half of what would render such a result possible! Another numerous class of societies profess to return L.70 at the end of 10 years for L.30 contributed during that term in monthly payments of 5s.; and it professes to advance to its members at the outset the whole L.30 for the same rate of payment. In these societies, loans on such easy terms are of course in greater demand than can be met, and in the event of competition occurring, they are put up to auction. In the most favourable case for the society, however, it is shown that there would be an annual deficiency of 10 per cent. rate of interest. Other prospectuses promise their investing members 20 per cent. interest for the use of their subscriptions, while borrowing members 'will scarcely pay at the rate of 2 per cent. interest for their loans!' Again, 'It is calculated that those members who allow their subscriptions to accumulate at compound interest till the close of this society, will receive about 25 per cent. annual interest for the same, &c. &c.; and from 80 to 100 per cent. profit will be obtained by those members who purchase property with the money advanced to them by the society.' One grand cause of all this absurdity is the competition of new societies, whose primary object is to fill up their subscription lists—

Get members, members still—
And then, let profit follow—if it will!

In the older societies at Liverpool and Manchester the shares were fixed at L.150, and the monthly payments at

20s. per share, and many terminated successfully; but their successors, improving upon their plan, deduct one-half from the monthly payments, but only one-fifth from the amount of the shares, and so contrive, by some extraordinary hocus pocus, that the one class of its members shall receive what the other class does not pay!

A Permanent Society is thus described by Mr Scratchley:—'The investors pay a certain monthly subscription during a *fixed* number of years, calculated as sufficient for the realisation of their shares, at the end of which time the amount due is paid to them, and they secede from the association, as far as such shares are concerned. The investors represent the proprietors of the society. New members can enter at any time, and commence their subscriptions without paying up any arrears or any increase on the original entrance fee, whereas in terminating societies, the fee on entering is increased without sufficient reason year by year, until, from being originally only 2s. 6d., it is in some cases raised to L.6 per share. The duration of a membership is counted from the month of a member's first entrance. This causes every month a fresh series of members to be added to the society, or new shares to be issued, so that, taking an example, if the term of membership were 10 years, or 120 months, and 50 new shares on the average were taken up every month, there would, at the end of the first 10 years, be 6000 shares subscribed, supposing always that if any were withdrawn, the average were yet kept up by an increase in the new-comers. At the end of the first 120 months, or 10 years, 50 would be paid out; but as new members would come in, the number of subscribers would be undiminished, and month by month afterwards, as successive periods of 120 months were completed, old members would go out, and new ones come in.'

In this society a member ceases to be an investor when he becomes a borrower, receiving whatever amount is due to him on his investing shares, with interest up to the time of borrowing. The loan, secured by mortgage on the property purchased, is for an optional fixed number of years, and is repaid, with interest, by a corresponding monthly subscription. The interest is greater than the rate promised to the investors, perhaps by 2 per cent., and the difference forms a management and contingent fund to meet expenses and losses. With regard to the investors, instead of reducing their subscriptions to an amount consistent with the theoretical *hopes* of the projectors, they are kept sufficiently high to meet any probable disappointment; and the bonus system is adopted, or periodical division of profits, which has been found so successful by the life-assurance societies. Investors desiring at any time to withdraw, receive the amount they have actually paid, with compound interest.

'As an example of the working of this society:—Suppose a member purchases a house for L.300, which would return a *net rental* of L.30 per annum,* and he borrows that sum, for which his repayments during ten years, covering principal and interest, would amount, at per annum (by monthly instalments of L.3, 11s. 3d.) to

	L.42 15 0
Multiplied by 10 years,	10

Making the total repayments,	L.427 10 0
Deduct 10 years' rent (paid or received),	300 0 0

Leaving the cost, as far as the building society is concerned, -	L.127 10 0
--	------------

For which sum the member has thus secured to his family a house free of rent for the remainder of its lease. The above example is for 10 years; a party can, however, purchase a house by smaller annual payments, by taking the loan out for 12 or 14 years.*

Thus we see building societies, constructed on safe and respectable principles, do not give us our houses or loans altogether for nothing. We do not purchase a house,

* As we are not acquainted with any district where a house renting at L.30 could be purchased for L.300, we have, in our own ideal example, given a less flattering view of results. The above case, however, serves equally well to illustrate the theory.—Ed.

unless under remarkably advantageous circumstances, by merely paying the usual rent to a building society for ten years; but by a reasonable effort—by the sacrifice, perhaps, of an unimportant luxury—we may attain this desirable object, and become our own landlord. In the case given above, the purchase would cost the borrower only £12, 15s. a year for a very reasonable space.

We cannot follow our author into the working details of such a society, but we are rather surprised to observe that in so judicious a work there is omitted all reference to the very basis upon which the security of the members rests. Building societies are mainly intended for the benefit of persons of very moderate means, and their cash transactions are not upon the footing of public respectability, which gives security, for instance, in a bank. This is the first point to be considered; for even the wild miscalculations we have pointed out in some terminating societies will merely involve partial loss, or carry on their duration beyond the period specified. There must be security for the intrusions of those who are in anyway concerned in handling the money of the company, or the wisdom with which the scheme may be concocted will be no guarantee against ruinous loss.

PETER MACKENZIE THE NATURALIST.

To readers of the various horticultural periodicals of the present day the name of this naturalist will be familiar. Week after week, and month after month, communications appear in such publications from the industrious pen of Peter Mackenzie on subjects relating to almost every department of natural history and gardening: at one time philosophising upon the obscure birth of storms from the observations made upon a dewdrop, and at another discussing some scheme for increasing the productive riches of our country; now communicating some observations calculated to extend our knowledge of the laws that regulate the local and geographical distribution of organic beings, and again relating in familiar style some of those simple facts in natural history that find so much interest with the lover of nature who has not viewed her objects by the light of science. Long, however, as the gardening world have familiarly known Peter Mackenzie the naturalist, such as he has been mirrored in the *monthlies* and *weeklies*, very few, indeed, know aught of Peter Mackenzie the man. At present it is our pleasing task to disclose something of his private life; and although his is not a history chequered by the exciting incidents of fortune and misfortune, it is nevertheless one likely to prove interesting, as showing, in a thoroughly practical manner, that the purest intellectual enjoyments are attainable in the humblest rank of society; that the labourer, after his hard day's work is done, may calmly sit down by the fireside, and spend his evenings in the prosecution of scientific study, without any sacrifice of domestic enjoyment.

Peter Mackenzie was born in the parish of St Ninians, near Stirling, on 17th July 1802. His parents were in a very humble station, his father being a country weaver; but a scanty income is not necessarily accompanied by poverty and lack of domestic comfort, and through industry and carefulness they spent their days in a comfortable manner, leaving at their death a small portion to their family. Peter was the second of six sons, who all became gardeners. His scholastic education consisted of reading, writing, and a little arithmetic—acquirements that seemed ample, indeed somewhat rare, for one in his humble station of life in the rural districts of Scotland forty years ago. In his early days he used, like all other country boys, to stroll among the woods, gathering the wild berries and the wild flowers that came in his way; and on one occasion, inspired by his father's enthusiastic description of the woods, the streams, and the waterfalls of his native place, he left the paternal roof unknown to his parents, and wandered away to gratify his youthful curiosity by a ramble among these scenes of beauty and sublimity. But this

was more a boyish frolic than a testimony of his love of natural-history investigations. His eyes had not then learned to love and linger upon such interesting beauties of the woodland as *Serratula tinctoria* and the white-flowered *Campanula latifolia*, which he in after-years detected in the Moonzie woods.

In the spring of 1820 he went to reside for a time with his brother, then gardener to the late Sir George Murray, governor of the Royal Military College, Sandhurst, where his taste for gardening and natural history were first evinced. Here he entered, as it were, upon a new world; and the lovely gardens under his brother's care, bursting into life and beauty, lured him often to watch and admire the lovely flowers that adorned them. This soon induced him to begin the study of botany, in such a manner as his circumstances would allow. Many a weary wandering had he in the adjoining woods—lonely, yet not less delightful for that—seeking the many native gems which the district produced; and he preferred culling the heather-bells that crowned the hills of Bagshot Heath, to gazing on the military heroes of the age—from the Duke of Wellington downwards—who were frequent visitors at Sandhurst, and much more likely, one would think, to interest a boyish fancy than the modest flowers of the hedgerows. On his brother's bookshelf he found several standard works on gardening, such as those of Abercromby, Nicoll, Speechly, and Forsyth, through which he gained a pretty intimate acquaintance with the principles as well as the practical details of horticulture; but the books that chiefly engaged his attention were Lee's 'Introduction to Botany,' Don's 'Catalogue of Plants,' and Thornton's 'Grammar of Botany'—the last of which he committed almost entirely to memory, by learning a few of the terms at a time—a most laborious mode of acquiring the elements of a science, and one which he assuredly would never have pursued had he had the benefit of an instructor to guide him in his studies. By the aid of these works he made himself thoroughly acquainted with the Linnæan system of botany, which forms a most convenient key to all future researches in the science, and soon became familiar with the scientific titles of most of the plants cultivated in the garden at Sandhurst; but he still felt the want of a proper acquaintance with the generic and specific characters of vegetables—a deficiency which was not supplied for some years afterwards. While residing at Sandhurst, his enthusiastic attachment to botanical pursuits gained him admission to many of the celebrated horticultural establishments in the surrounding neighbourhood, which were of great benefit to him in extending his knowledge of the floral riches of other lands. The royal garden in the vicinity of Windsor, as well as the gardens of the Marquis of Devonshire, and many others of note, were frequently visited by Peter; and during these visits he was often brought into contact with such eminent horticulturists as Mr Ingram, gardener to her Majesty, and Mr Towers, now overseer to his Royal Highness Prince Albert at Osborne.

After a stay of about two years at Sandhurst, the subject of our memoir proceeded to London; and having previously decided upon gardening as the means of gaining his daily bread, he obtained work in a metropolitan nursery. Although one of the youngest hands employed in the grounds, he very soon distinguished himself, and the plant-houses were committed to his charge, including an extensive collection of Alpine plants, which he experienced great pleasure in nursing with the tenderest care; for those lowly gems that form the scanty Flora of the frigid regions are esteemed above all others by the genuine botanist.

Anxious to improve himself as much as possible in his profession, by gaining an acquaintance with every department of horticultural science, and with the systems of cultivation adopted at different places, Peter left London to take charge of the forcing department in the gardens of the Earl of Limerick, South-hill Park, where he had opportunities of obtaining a practical

acquaintance with the culture of the pine-apple, and forcing in general. His studies of native botany were not, however, entirely laid aside; and when the labours of the day were over, he enjoyed many a pleasant summer evening's ramble over miles of muir and heather, which formerly were part of Windsor Forest.

After living in several other situations nearer London, he left England about the end of the year 1824; and retracing his steps northwards, in the spring of 1825, he obtained a situation in the garden of Tulliallan, near Kincardine. Here he had the advantage of an excellent circulating library, including such important works as the 'Encyclopædia Britannica,' &c.; and he made considerable advances in the study of natural history, more particularly botany, which was always his favourite subject. He commenced the study of conchology, but chiefly occupied himself with botany, and now began a thorough examination of our native Flora. For this purpose he made a trip to Edinburgh, to purchase books on the subject, among which was Smith's 'Flora Britannica.' This work being in Latin, he devoted the long winter evenings to the acquisition of that language, and was able to take the field, with Smith as a useful pocket companion, by the time the first primrose of spring appeared. He likewise acquired enough of French to enable him to understand 'Le Bon Jardinier.'

After a short sojourn in the Royal Botanic Garden of Edinburgh, he returned to reside with his mother at St Ninian's, and entered the employment of Messrs Drummond and Sons, Stirling, where he enjoyed the advantages of the lectures delivered in the Stirling School of Arts, and other local means of intellectual improvement. While here, he made several excursions to the Highland districts with the view of extending his knowledge of our alpine Flora. In one season he visited various parts of the higher districts of Perthshire, Forfarshire, &c.; and during the next ascended Ben Lawers—returning by Killin, Lochearnhead, Ben Ledi, and Callender. He was frequently to be seen with his vasculum on his shoulder, or his geological hammer and bag by his side, wandering among the Campsie hills and the Ochils.

Peter finally settled in 1828 in the employment of Robert Louis, Esq. of West Plean. Ever since, he has been ardently engaged in his favourite studies during the leisure hours which his employment affords. The kindness of his employer places a day or two of holiday now and then at his disposal; and situated in a local position of the most favourable kind for the naturalist, and in the vicinity of some of the noblest of nature's scenes, he has eagerly embraced these opportunities of exploring the fields and mountains of his native land—at one time gathering the lowly flowers of Ben Lomond, and at another making his bed among the harebells on the mossy banks of Loch Katrine. His observations in natural history he has from time to time been in the habit of communicating to the various journals and magazines of gardening, and has by this means been frequently brought into correspondence and personal contact with distinguished followers of science. He used to write for the 'Gardeners' Magazine,' when under the superintendence of Mr Loudon; and one morning he received from the hand of a special messenger a note of invitation to breakfast with that celebrated naturalist in the Royal Hotel, Stirling, Mr Loudon being then on a horticultural tour in Scotland. Peter justly considered this an honour of no mean kind. What passed that morning was made the subject of a leading article in the 'Gardeners' Magazine,' dated from Stirling, in which Mr Loudon—without venturing to offend the retiring modesty of Peter by mentioning his name—refers to the circumstance that he had been in conversation with one of the most intelligent gardeners he had met with in Scotland.

Thus have we briefly sketched the peaceful path through life, so far as it has gone, of a common working-man, but one who has sought out for himself enjoy-

ments of a more lofty character than are usually aimed at in his humble sphere. He enjoys a degree of domestic happiness and contentment rarely to be met with in such an humble home, and with such a scanty income as has always been his lot. With a loving wife, and a rising family around him, he seeks his evening enjoyments at his own fireside, quietly pursuing his favourite studies of natural history, and now and then communicating the results of his observations and investigations to the world. In perusing the productions of Peter Mackenzie in the horticultural magazines, few may have conjectured that they were penned in so humble a home, and by one so unambitious of fame; or that the love of nature they exhibit is so genuine a transcript of the mind of the writer.

THE CHÂTELAINE OF TO-DAY AND OF OTHER TIMES.

WE presume that most of our readers know the meaning of the word *châtelaine* in our modern English vocabulary. They have doubtless seen depending from the waists of our fashionable ladies a huge bunch of steel or golden chains, which gently rustle with every movement of the wearer, and from each of which is suspended some article of household use—a key, a pincushion, a thimble-case, a penknife, a corkscrew, &c. &c. We might imagine this to be a symptom of revived notability among the higher classes of our countrywomen, did not the Lilliputian size of these various articles forbid the supposition. No: it is but the whim of fashion, and a very harmless one too. To talk of the uselessness of these trinkets would be but an idle cavil; for who ever supposes that the fairy-wand of fashion is to be stretched out under the guidance of utility or common sense! We only allude to this novelty here by way of contrasting the ancient and modern meaning of the word, and to show how insensibly it has changed its signification. This we can best do by presenting our readers with pictures of some ladies who, at different epochs of modern civilisation, have illustrated the character of *châtelaine* in France, from whose language, we need scarcely say, this word is taken. It is not necessary for this purpose to go back to the early ages of Chivalry, when each manorial house was a castle, and its mistress, in the fullest sense of the word, a *châtelaine*, or castle-keeper. Let us, only for a moment, transport ourselves to the ancient manor of La Louverie, which still stands in tolerable preservation near the foot of the Vosges, and which offers a very fair specimen of the French *châteaux* of former days.

The edifice forms a long parallelogram, flanked with four small round towers, and stands on an elevated spot above the neighbouring village, which seems as if it rested peacefully beneath its protection. Its parapets, drawbridges, and posterns, have nearly disappeared: upon its walls there is neither escutcheon nor device; but above the principal gate there still appears a wolf salient on a field of gules, with the motto, 'Lupa ridet.' These are the speaking arms of the Seigneurs de la Louverie, at whose dwelling we are about to glance. The ground-floor, which is chiefly occupied by the present proprietor and his family, is simply furnished, and offers nothing remarkable in its aspect; but the ancient adornments of the first-floor have been so religiously preserved, that, on ascending the handsome black marble staircase, and wandering through the apartments, one is transported in thought to bygone periods of castle-life in France. At first the low ceiling, with its ponderous uncovered beams; the deep-set ogive windows; the leather hangings stamped with gold; the sandalwood *prie-dieu*; the state bed, with its twisted pillars, its plume of feathers, its damask curtains embroidered with the family coat-of-arms—all bring the sixteenth century clearly before your eyes, with its rich and stately costliness. But if you penetrate into the right wing of the building, you feel yourself almost in presence of the *grand roi*, whose favourite ebony presses, luxurious *fauteuils*, and mythological timepieces, still bear the name of Louis Quatorze. And again, if we

look into the opposite wing, the eighteenth century is represented in all the coquettish elegance of its Pompadour pier-glasses, its Chinese figures, its Japanese vases, its painted hangings; nor must we forget to notice a *bergerie* of Watteau's, and two beautiful *pastels* of Latour's, representing Louis XV. and the dauphin—*pastels* whose colours have in a most remarkable manner preserved all their original freshness. In this latter apartment are to be found the portraits of some of the most distinguished châtelaines of La Louverie; and in accordance with our proposed plan, we go on to give a sketch of three of those who, at different epochs, have the most fully embodied the spirit of their times. First, let us pause before the antique frame in which is enshased the portrait of

IOLANDE D'ASTREL, FIRST COUNTESS DE LA LOUVERIE.

Married at sixteen to a man every way worthy of her, Iolande's tastes remained pure and simple as in the days of her childhood. She quitted her mountains but once to be presented at court: it was in the reign of Henry II. Iolande's noble and independent spirit had but little sympathy with the corruption and the intrigues of Catharine de Médici's Italian court. She hastened back as soon as possible to her beloved castle, where she spent the remainder of her days. It is there that we will contemplate her in the usual course of her domestic life.

The first *angelus* has sounded; it is scarcely daylight, and yet Iolande is dressed. She comes with the little Bertha and Dame Regina, the *intendante*, to attend family worship. Masters and servants meet together on their knees, to ask the blessing of God upon their daily labours. Immediately afterwards each one receives his appointed task—labourers and farmers, knitters and spinners, messengers of town and country, all are sent on their mission of healthful toil. Nor are the heads of the household idle. The count goes to preside at the court of the bailiwick; while Iolande, surrounded by her women, sits in a large apartment, where she diligently embroiders in silver a vest for her lord and master. Her work is only interrupted by the caresses of Bertha, or by a visit of helpful charity to the poorer vassals of the domain, in which she is accompanied by her youthful daughter; and rarely does a day pass without Bertha receiving from her mother this practical lesson of benevolence. But while we are depicting the life and character of our châtelaine, let us not forget to give some idea of her person. Iolande's figure is tall and dignified; her close-fitting habit, of a *feuille-morte* colour, reminds one of the huntress Diana; her head-dress, a *toque à la Jeanne* and her *aumônère* always at her side: such is her usual costume.

The castle has, however, its festal as well as its working days; and it is at such times that the courtly farthingale, the costly pearl-necklace, and ruby bracelets, shine forth in all their splendour. This very morning Iolande is adorned with them in honour of Enguerrand d'Argy, who, after attending her lord for four years upon the battle-field as his squire, is about to receive the reward of his faithful services. Already is the procession advancing towards the chapel, which, by the care of Don Anselm, the almoner, has been decorated with Flanders tapestry and a girdle of white damask embroidered with the family arms. Placed between his brother-at-arms and his godfather, Enguerrand advances and kneels before the count, who, after the usual oath, invests him with the coat-of-mail, the sword, and the spurs, saying to him at the conclusion, 'In the name of God, of St Michael, and St George, I make thee a knight: be courteous and loyal.' Then Iolande bestows on him a gold-fringed scarf, and the sound of trumpets announces that the ceremony is over.

This martial service is followed by the sport of hawking. Mounted on their finest chargers, the neighbouring barons and gentlemen press around the countess, who, with falcon on wrist, ambles along across the wild uncultivated heath. How eagerly does her glance follow the unhooded bird as it soars proudly upwards, sometimes seizing the innocent dove, sometimes struggling bravely with the kite or the sparrow-hawk! After a few hours spent

in this exciting chase, the whole party return to the castle. On alighting from horseback, Iolande learns that a servant of the count has been thrown from his horse, and severely hurt. She hastens to his succour—for in those days the art of surgery is a feminine accomplishment, and not only do ladies use the lancet, and dress a wound, but also can they compose the celebrated herb-plaster of *Malpighi*. The fair Iolande is followed by her maidens, bearing medicines and bandages, and through her good care the wounded man soon recovers.

But here comes the squire, with his armorial escutcheon blazoned diagonally on his breast: he opens the folding-doors of the grand saloon, and bows twice to the countess, by way of announcing to her that the banquet is served. Nothing is found wanting; neither the wild boar's head stuffed with pistachios, nor the *cel aux andivas*, nor the golden pheasant; and there are also the preserved quinces and pomegranates, recently imported from Italy by Catharine of Medicis; and the delicious wines of Rivesaltes and of Jurançon, which flow freely in honour of the newly-created knight: for whose pleasure also Beranger de Sirvat has been invited to the feast. This celebrated man, the last of the *trouvères*, sings his favourite ballads, some of which are accompanied by Iolande on her sweet-stringed instrument, the *théorba*. Midnight sounds from the belfry, and the feast is over; nor are the guests unwilling to repose themselves after the fatigues and pleasures of the day.

DIANA D'OLBREUSE.

But here comes the beautiful Diana d'Olbreuse, for she, too, has been the Châtelaine of La Louverie. Her portrait, so full of great airs, and done by Mignard, might tell us the epoch at which she lived, if this *fontange* of rich crimson velvet, these *engagantes* of Artois gimp, this head-dress à la *Ninon*, did not announce to us still more clearly a contemporary of Louis XIV. Nevertheless the attire of Diana and of her grandmother Iolande differ even less than their lives. For Diana there is no more chase with the falcon, no more knights to honour, no more bards to receive: if she passes a few months at the Château de la Louverie in a sort of rustic exile, her heart and her thoughts are not the less devoted to Versailles, for in that brilliant court alone are centered all her wishes. She, like her cousin Madame de Sévigné, has danced with the great monarch, who has done homage to her fine eyes and to her sparkling wit, and from that moment admirers and slaves have crowded around her. But if we would understand her position, let us just follow her in the employment of a single day. Left a widow at the age of eight-and-twenty, she is the absolute mistress of her time and fortune. She is not averse to ease and pleasure: wherefore, then, is she abroad at an hour when most of the courtly dames are still slumbering on their couches? She has risen with the early dawn, and at six o'clock her coach stands waiting before her hotel. Has she not promised to call on M. Louvois, the earliest of ministers? She has a favour to ask of him for a young relation, the Baron d'Arzac, who is vegetating in the provinces in some obscure regiment. He is dying of ennui. She wishes to obtain for him the rank of standard-bearer in the Gendarme-Dauphin. Many nobles of distinction are seeking for the post, but our Armida pleads so eloquently, so gracefully, that the hardhearted minister at length yields to her intreaties. D'Arzac is named in the Gendarme-Dauphin, which, by a lucky chance, is stationed at Rambouillet—no great distance from Versailles.

'Good deeds bring good-luck:' so says the proverb, and so perhaps thought the countess, when, on her return home, she found her friend Lulli, who came to offer her a box for the first representation of his opera of 'Atys.' Benserade and Chaulieu arrive most opportunely, and are to be of the party. They dine at the countess's hotel. Lulli's *bon-mots* are *piquant* and graceful; the abbé's songs are charming; the repast is so agreeable, that the guests might linger over it longer, if Benserade had not proposed to his fair hostess to go and listen to a very fashionable preacher at the church of St Louis. 'All the court will be there.' The argument is unanswerable:

nor do our friends regret their attendance, for the young Fléchier, in his sermon upon 'La Grâce,' is so simply eloquent, and yet so polished and persuasive, that he kindles the spirits and touches the hearts of his auditory. 'Chaulieu,' said the countess with deep emotion, 'this little abbé will make a noise in the world; remember my prediction.' But however captivating may be the orator, Madame de la Louverie and her friends must make their retreat. It is now six o'clock by Lulli's watch, and in a few minutes his opera will begin. It is his very best performance, he says, and a most happy inspiration. 'We shall see,' replied Benserade coldly.

This is a golden evening for Diana, since, independently of her friendship for Lulli, she is to hear her two favourite singers, Rochois and Baumaviel. Placed in a front seat of the box, she does not lose a note of this music. Baumaviel excels himself in the part of *Atys*, which he performs with so much talent, and such deep tenderness, that the passionate emotion he evinces passes into the hearts of his listeners; and on the name of the composer being announced, the whole audience rise up, and after a prolonged burst of 'bravos!' turn towards the countess, and cry out—'Embrace him, madame, for us all'—a request with which she joyously acquiesces. As for Lulli, he is moved even to tears. This is the most triumphant evening of his life.

As every fashionable evening at Versailles is concluded with play, Diana goes to show herself at the *pharaon* of Madame de Noailles. Fortune still seems favourable to her, and in the course of a few minutes she wins a considerable sum. Perhaps she might be tempted to linger there much longer, but that she is to be, early the next morning, of a party to *Marly*—a favour so inestimable, as to be the object of desire and envy to all the courtiers. She vanishes, therefore, with regret; for it is midnight, and the court sets out precisely at seven o'clock. This is the official hour named by Louis XIV. himself; and who will presume to keep the great monarch waiting even a moment?

ATHÉNAÏS DE THERMES.

Repose in peace, Iolande, and you, noble Diana! She who inherits your name in the reign of Louis XV. upholds its splendour, and the Countess Athénaïs is one of the most attractive women of the pleasure-loving period in which she lives. You both did the honours of your *salons* most admirably; but she is more winning, more captivating in society. You were beautiful: Athénaïs is pretty. The *crêpe-Pompadour*, the *mouche-assassine*, the jet necklace, set off the brilliancy of her complexion; and if she puts on rouge, it is only in compliance with the caprice of fashion; for her mirror, as well as her *camériste* Florine, assures her she has no need of it. But if we wish to know her better, let us do as we did with the *châtelaines* of former ages, and take a glance at her domestic life.

With very little taste for rural pleasures, she reluctantly visits her old castle of the Vosges. To entertain country gentlemen—to distribute *pain bénit*, as lady of the manor—to crown with roses pretty but low-born maidens—this is all very dull work for a woman of rank and fashion: at least so thought the Countess Athénaïs. Therefore, with the first falling leaves of autumn, she flies from La Louverie, leaving the count to enjoy alone the pleasures of the chase, and the occupations of planting, giving leases, settling accounts, &c. Our pretty countess, meanwhile, is enjoying other sort of pleasures in Paris, where, on Monday evenings (being the appointed times of her reception), her door is thronged with equipages, with chairs, livery-servants, couriers, &c. Outside, her hotel bears a bright and joyous aspect. Let us, out of curiosity, look within for a moment.

The countess has a slight headache this evening, which imparts to her features a certain degree of languor, which adds to their beauty. Like a woman of true taste, she has avoided any display of toilette at her own house: her head-dress, *crêpe-plat*, without ornaments; her robe, a zizoline, without flounces; such is her attire. Scarcely has she entered her saloon, when M. de Létorière is an-

nounced. He is the most fascinating* man at court, and his fine form and countenance are set off by his costume. What can be more perfect in point of taste than these points of dead gold, this sword-tie à la *maréchale*, or what more costly than this emerald-green coat of the richest velvet, and these shoe-buckles sparkling with jewels! Létorière advances courteously—'In truth, fair lady, I am most fortunate in seeing you this evening, for despite your headache, you look divinely pretty (*jolie à miracle*).'

This phrase is uttered with the graceful nonchalance so peculiar to himself. He then takes up the countess' lapdog, teases it, fondles it. But other visitors are announced. The apartments are soon thronged. Compliments, witticisms, repartees, are heard on all sides. But what attracts the company to this side of the saloon? A *macao* has just been established; a thousand louis are on the table, which sufficiently explains the divers exclamations which are heard, and the passion depicted on many faces, which had previously been clothed with smiles: the love of gold triumphs over all gentler feelings. In the adjoining boudoir, however, the scene is far different: there the buzzing of a fly might be heard, so wrapt is the attention of those who are gathered round St Lambert as he recites the first canto of his poem, 'The Seasons,' Buffon, Diderot, Fontenelle, La Harpe, are among his listeners, and they are not less captivated by the beauty of his voice and the perfection of his intonation and his gesture, than by the merit of a work which was extremely popular in those days. No sooner is the reading ended, than the warmest plaudits are heard on all sides; and then supper is announced. And who knows not what were the *petits soupers* of those days of *gourmandise* and dissipation?

To-morrow, new pleasures, new fêtes. Longchamps† has its spiritual concert: Athénaïs must positively show herself there, although it can be but for a moment; for on this same evening a very fashionable piece, 'Les Fausses Confidences,' by Marivaux, is to be rehearsed at Madame de Poplinière's, and the part of *Araminta* has been assigned to her.

Such was the course of life pursued by the Châtelaine de la Louverie in the eighteenth century. Need we say that this title had now lost all its significance? The possessor of it no longer valued its privileges, nor attended to its duties; she cared not to welcome the stranger within her baronial walls; she gave no heed to the wants or the sorrows of her vassals; so the hearts of those vassals were turned away from her, and that title which she had despised passed away into an empty name; nor will it probably ever be revived, save in the glittering bauble which has recently been appended to the waists of our fashionable ladies.

And so will it ever be! For when once any great reality has been allowed to dwindle into an idle 'sham,' then assuredly is it on the eve of fading altogether into oblivion, or else of passing into a shadowy mockery of its former self.

THE EXPECTED COMET.

For some time expectations have been entertained in the learned world respecting the appearance of a large comet. There has, however, been considerable diversity of opinion as to the exact period when it would show itself in the heavens. The reason for this diversity is the difficulty of appreciating and calculating the retardations which comets suffer by being drawn, as it were, out of their ordinary course by the larger planets. Matter attracts matter, and consequently a comet in shooting past a planet is attracted and retarded according to the distance and respective size of the two bodies. That there should be a power of ascertaining and measuring these perturbing influences, gives one an impressive idea of mathematical science. A man

* M. Létorière's history is given in No. 226 of this Journal, under the title of 'L'homme Charmant.'

† See No. 232 of the Journal.

sits down to study, and with pen, paper, and compasses, calculates and tells you where a vagrant comet was hundreds of years ago, and where it will again present itself hundreds of years hence. Such nicety, however, is required in these calculations, that it is not wonderful that errors should occur, and that the predictions on the subject should slightly vary.

The comet now in expectation is that which appeared in 1264, and again in 1556. The length of time between these two periods may be easily computed, but that would not tell us when would be the next appearance; because the causes and degrees of retardation are different in the two journeys through space. Astronomers all over Europe have been for some time busy in making researches in this interesting branch of inquiry; and it may be said to be a matter of pride which country shall furnish the most correct prediction—in other words, which shall show itself most profoundly skilled in mathematics. England, Germany, the Netherlands, and France, are ardently competing. As yet, none can say which is to gain the prize. Meanwhile the London papers have been giving accounts of what certain astronomers are doing in this cometary struggle. One of the most instructive parts of the discussion is a letter in the 'Times' from Mr J. R. Hind, describing the results at which Bomme, a Netherland astronomer, has arrived; and this we abridge as follows, for the sake of extending a knowledge of the subject:—

'I have just,' says Mr Hind, 'received from M. Bomme of Middleburg a very complete memoir, which has been recently published by the Royal Institute of Sciences in the Netherlands. It is the result of a long and laborious series of calculations, performed on the most approved methods of modern mathematicians.

'In order to predict the time of reappearance of a comet moving in an elliptic orbit, with allowance for the attractions of the planets, it is necessary that we should know the precise time of revolution corresponding to some past epoch (as, for instance, the previous perihelion passage), or the period which the comet would require to perform its circuit round the sun, if all planetary disturbances were to cease from that moment. The comet in question was observed in 1264 and 1556, and the interval between the perihelion passages in those years amounted to 106,567 days, or 291½ years; but this tells as nothing with respect to the length of period corresponding to the ellipse described at the instant of perihelion either in 1264 and 1556, since it includes the united effects of planetary perturbations between those years. Therefore, before we can ascertain the epoch of the next return, we must calculate the amount of acceleration or retardation due to the disturbances between 1264 or 1556, which being applied to the above period, gives us the exact time of revolution of the comet at the moment of perihelion passage in the former year, and hence we ascertain the period in 1556. Having found this, we can calculate how much it would be increased or diminished by planetary attraction up to the present time, and thus determine the date of the next arrival at perihelion. This is essentially the method adopted by M. Bomme, and he has performed a great part of the computations in duplicate—first, with the elements of Halley, in 1556, found in all our catalogues of cometary orbits, and, again, with my final elements, published in the "Astronomische Nachrichten" of Professor Schumacher, the "Comptes Rendus" of the French Institute, the "Notices" of the Royal Astronomical Society, and elsewhere: this last set only came to M. Bomme's knowledge when he had nearly completed the first series of calculations, but, as he considered them more exact, he went through the greater part of the work again. With these elements, taking into account the attraction of Jupiter, Saturn, Uranus, and Neptune, between 1264 and the present time, and of Venus and the Earth in 1556, it is found that the length of the comet's revolution at the time of perihelion passage in 1264 was 110,644 days, or 302·922 years; and in 1556, 112,561 days, or 308·169 years; that the effects of perturbation will diminish this period 2166 days, and therefore the present revolution will occupy 110,395 days, or 302½ years, so that the comet will return again to its perihelion on the 2d of August 1858, and will then be moving in an ellipse of 112,785 days' period. With Halley's elements, the true time of revolution of the comet in 1556 was 112,943 days, and the perturbations should di-

minish the ensuing period about 1797 days, whence we find the next perihelion passage will occur on August 22, 1860.

'Thus M. Bomme concludes, that if the true elements of the orbit in 1556 were within the limits assigned by Halley's calculation and my own, the comet will appear again between 1858 and 1860. The main cause of this uncertainty is the difference between the two determinations of the position of the major axis, or line of Apseides, in 1556. Halley fixes the perihelion in longitude 278° 50', while I place it in longitude 274° 15', deviating 4° 35'. Having expended a good deal of time and trouble some years ago on the calculations for my orbit, I believe I may safely state that the utmost allowance that can be made for error in the position of the major axis does not exceed 4°, so that it is probable the time fixed for the return of the comet by my elements (August 2, 1858) must be within two years of the truth, and therefore we have but little chance of seeing it within six years from this time. At anyrate, the supposed delay in its reappearance is fully accounted for through the zeal and industry of M. Bomme, whose calculations as regards extent and intricacy may vie with those of Clairault and Rosenberger for Halley's comet.'

THE HOUSE FLY.

A fly on the wing is no less curious an object than one on foot; yet when do we trouble our heads about it, except as a thing which troubles us? The most obvious wonder of its flight is its variety of direction, most usually forwards, with its back like a bird; but on occasions backwards, with its back downwards, as when starting from the window, and alighting on the ceiling. Marvellous velocity is another of its characteristics. By fair comparison of sizes, what is the swiftness of a race-horse clearing his mile a minute to the speed of the fly cutting through her third of the same distance in the same time! And what the speed of our steaming giants, the grand puffers of the age, compared with the swiftness of our tiny buzzers—of whom a monster train, scenting their game afar, may ever follow partridges and pheasants on the wings of steam in their last flight, as friendly offerings! But, however, with their game the flies themselves would be most in 'keeping' on the atmospheric line—a principal agent in their flight, as well as in that of other insects, being the air. This enters from the breathing organs of their bodies in the nerves and muscles of their wings, from which arrangement their velocity depends, not alone on muscular power, but also on the state of the atmosphere. How does the fly buzz? is another question more easily asked than answered. 'With its wings, to be sure!' hastily replies one of our readers. 'With its wings, as they vibrate upon the air,' responds another, with a smile half of contempt half of complacency at his own more common measurement of natural philosophy. But how, then, let us ask, can the great dragon-fly, and other similar broad-pinioned, rapid-flying insects, cut through the air with silent swiftness, while others go on buzzing when not upon the wing at all? Rennie, who has already put this posing query, himself ascribes the sound partially to air, but to air as it plays on the 'edges of their wings at their origin, as with an *Æolian* harp string,' or to the friction of some internal organ on the root of the wings' nervures. Lastly, how does the fly feed?—the busy, curious fly, that 'drinks with me,' but does not 'drink as I'; his sole instrument for eating or drinking being his trunk or suck, the narrow pipe by means of which, when let down upon his dainties, he is enabled to imbibe as much as suits his capacity. This trunk may seem an instrument convenient enough when inserted into a saucer or sirup, or applied to the broken surface of an over-ripe blackberry, but we often see our sipper of sweets quite as busy on a solid lump of sugar, which we shall find, on close inspection, growing 'small by degrees' under his attack. How, without grinders, does he accomplish the consumption of such crystal condiment? A magnifier will solve the difficulty, and show how the fly dissolves his rock, Hannibal fashion, by a diluent, a salivary fluid passing down through the same pipe, which returns the sugar melted into sirup.—*Episodes of Insect Life.*

A RIDE IN A HURRICANE THROUGH THE SUGAR-CANES.

As we rapidly traversed the thickest part of the forest, doubting, darkling, and dripping from every pore with rain and perspiration, the hurricane came on in all its devastating frenzy, sweeping with resistless fury through the forest,

and bending with tremendous force the tops of the tallest and toughest trees almost to the earth out of which they grew. The thunder, which in the meanwhile had been approaching, now burst in astounding peals directly over our heads, waking up all the echoes of the surrounding forest, scaring the terrified birds from their nests, which with bewildered flight fluttered athwart the clashing branches of the trees; whilst the other wild inmates of the wilderness, startled from their lairs and hidingplaces, were hurrying to and fro in terror and confusion. The profound obscurity that prevailed was at intervals of two or three minutes broken by the most vivid flashes of lightning, which illuminated, though but for an almost inappreciable space of time, every glade and bole of the forest, rendering distinctly visible by its livid and awful brilliancy the minutest objects. The dire concord, or rather discord, of sights and sounds that took place on these rapidly-fleeing occasions was of the most extraordinary, appalling, yet ludicrous description. The instant the lightning flashed and exposed to view the numberless monkeys squatted upon the trees; the owls, vampire-bats, and other obscene birds of night, perched upon the branches; the vipers twined round their trunks, or creeping about their roots; and the wild animals hurrying to and fro on the ground; at that instant a horrid assemblage of sounds, composed of the hideous gibberings and squeakings of the monkeys, accompanied by the most ludicrous grimaces and contortions, the hootings of the owls, the shrieks of the vampire-bats, the hissing of the serpents, and the cries and howlings of the other wild animals, burst upon the startled ear, and surpassed, in the horror and hideousness of its *ensemble*, all the discordancy and terror of sound imagined by poets of the most heated imagination in their descriptions of the monsters of this world or the demons of the other. This appalling combination of sounds and sights thus momentarily heard and seen by the blue and lurid glare of the lightning, and accompanied by the fierce bellowing of the thunder, gave a shock similar to that which the mind might be supposed to feel if the awful veil that hides the shadowy terrors of the other world had been drawn aside, and the approach to the eternal abodes of misery and pain disclosed for an instant to the horrified gaze of mortal vision.—*Fraser's Magazine*.

A MARTYR'S VICTORY.

BY THE REV. JAMES GILBORN LYONS, LL.D.

[When Alaric the Goth was defeated at Pollentia and Verona (A.D. 403) by Stilicho, the general of Honorius, and so driven for a time from Italy, the Romans celebrated that event with great rejoicing and magnificence. A triumphal procession and a conflict of wild beasts at once dazzled and gratified the multitude. The shows of gladiators were then for ever brought to an end by Telemachus, an Asiatic monk, whom the people stoned to death in the amphitheatre for attempting to separate the combatants. Honorius was thus reminded of his duty as a Christian emperor, and soon after put forth an edict forbidding all such exhibitions for the future.]

THE streets are thronged in mighty Rome,
The gleaming ensigns spread,
While warriors march in triumph home,
With firm and measured tread:
For, bowed at last, and forced to yield
On rough Pollentia's crimson field,
Stern Alaric has fled,
And left his ruthless Gothic powers
All crushed beneath Verona's towers.

Those who once quailed at that dire name
May now deride their foe,
And boast as if *they* shared the fame
Of glorious Stilicho—
Of him who felt no craven fears
Rise at the flash of northern spears,
And struck no feeble blow,
But matched, with trophies green and high,
The monuments of days gone by.

But when the clear Italian sun
Pours down its noontide fire,
The trumpet speaks the games begun
Which idle crowds admire;
And soon, from barred and gloomy caves
Driven howling out by troops of slaves,
In grim and sullen ire,
Beasts, the wild brood of many a land,
Pace with loud rage the level sand.

Gætulia's lion, freshly brought
From scorched and desert plains,
And ravening tigers newly sought
On Parthia's waste domains;
Bears from the frozen Oder's mouth,
And panthers from the burning south,
Bred in old Nubian fanes,
Make there a stern and ghastly fray
For tribes more savage far than they.

But hark! the trumpet's warning peal
Is sounding as before,
And bondsmen clear, with staff and steel,
The red arena's floor;
The fainting brutes are swept away—
This saved to bleed another day,
That weltering in its gore;
And men, of martial frame and race,
Take with slow step the vacant place.

Two, chosen from the warlike throng,
Begin a deadly strife:
One a gray swordsman, scarred and strong,
One in the bloom of life;
This nursed where snows on Hæmus shine,
That torn from hills beside the Rhine
From children, home, and wife;
And high-born matrons hold their breath,
All bent to see the work of death.

Their toll was fierce, but short; and now,
Flung bleeding in the dust,
The Thracian waits, with pale cold brow,
The last and mortal thrust;
When rushing forth, till then unseen,
A swarthy pilgrim leaps between,
Strong in a Christian's trust,
And drenched with blood, yet undismayed,
Stays with fixed grasp the uplifted blade.

A light smooth cross of cedar wood
The gentle stranger bore,
Long worn in holy solitude
On Syria's palmy shore:
'Romans,' he said, 'for Him whose birth
Gave hopes divine of peace on earth,
Rise, and for evermore,
Servants of God in act and name,
Cast off these works of wrong and shame.'

He ceased; a scowl like noon's eclipse
Spreads fast from seat to seat,
And fourscore thousand hostile lips
Loud words of wrath repeat:
They rave and roar, as groves of pine
Waked on the Etrurian Apennine
When storms the tall crags beat,
Till, heaved and troubled furiously,
Breaks in one surge that living sea.

The German leaves his task undone,
The Thracian creeps aside,
The swordsmen flee like herds that shun
Vexed Arno's foaming tide;
But, as a pharos meets the shock
Of waves on some unsheltered rock
Where seas are deep and wide,
Telemachus looked up and trod
That post of danger true to God.

And when the stony tempest burst
On his defenceless head,
He stood unshrinking as at first,
As free from doubt or dread:
With aspect full of peace and love,
As if he came from worlds above,
And hands in prayer outspread,
He laid him down, nor breathed again,
Whelmed by that host of vengeful men.

Yet deem thou not the martyr died
Warring for right in vain;
His was the prize for which he sighed,
And his the eternal gain:
Fierce Alaric shall yet return,
And Rome's fair dwellings blaze and burn,
Filled with red heaps of slain;
But scenes, where man must bleed for mirth,
Shall blast no more the ransomed earth.

SOCIAL LIFE IN FRANCE.

CHANGE IN MANNERS—THE DISCONSOLATE HUSBAND—A CHATEAU—THE CHATELAIN'S FÊTE—THE CURÉ—WALKS AND RIDES.

I RETURNED to England in November of the same year, in consequence of the serious indisposition of my mother, and did not revisit France until some years after, when M. de Vorinfort, as sous-prefect of Tourloville, occupied a larger house, lived in a more expensive style, and saw more company. Louis was made lord of all the lower regions; and a black cook, called Dubois, reigned in his stead in the kitchen, who, when sober, was certainly not to be excelled in his department: when he had exceeded, however, he could and would do nothing, and then Louis very composedly put on his white dress and nightcap, and unostentatiously sent up the dinner—an example to our Johns and Thomases at home. Even the stairs were now carpeted; Caroline sat no more in her bedroom *en déshabille*, for every day was receiving-day; and, in short, I found a greater change in the habits of all than in so short a time I could have thought possible. Ladies and gentlemen had separate bathing-places at Piedfort; there was a public promenade made at Tourloville; two restaurateurs set up in competition, and served you with ice for nothing; opposition baths contested for your custom, and you could enjoy that luxury and clean linen besides for the small sum of 7½d. Ewers and basins had displaced the cream-jugs and pie-dishes which had hitherto been thought sufficient for bedroom ablutions; small carpets in cold weather were creeping in gradually; a *trottoir* of asphalt was formed in the Cour du Roi; the shops were modernised; and the streets, at least many of them, better paved. They were still ill-lighted, however; the drainage no better than formerly; and the contrast to England great in-doors and out. Noise still prevailed everywhere: sabots clattered, doors clashed, chairs sounded on the uneven and naked floors, and the clapping of the women beating their linen at the fountain was ever and anon heard above the clack of their coarse voices. The screams of the numerous parrots, who, like their mistresses, lived in the streets, one sitting in a cage, and the other in a tub; the lumbering of the unwieldy carts, and the unnecessary vociferations and execrations of their drivers, swelled the din.

The time I arrived on my second visit was the month of June, when they were preparing the *reposoirs* to celebrate the Fête Dieu. What refined taste did these poor people display in the arches and altars they formed with flowers, and whatever articles of value they could beg or borrow from their richer neighbours!—all the streets were swept clean, and strewn with rose leaves and broom; all the houses hung out bits of tapestry, or carpet, or sheets looped up with bunches of flowers;

everything or person was, as they expressed it, '*propreté*' for the occasion; and as the procession passed, the priests chanting, and the curé blessing the kneeling crowd,* I had no inclination to deride what so many felt to be solemn. But the prettiest part of the display was the little children with wings, or lambs, and innocent faces personating angels and St Johns; while the mothers ran alongside, weeping with delight to see their darlings looking like what they supposed and hoped they would eventually be in a better world. Their elder brothers and sisters, who had lately taken their first communion, walked in order—the latter in white, and veiled, and looking as demure as the meek sisters who attended them.

A little later came the Fair of St Victor, and that was a sight to me quite as pleasing in a different way: no quarrelling, no drunkenness or fighting was there. It was held partly in a large apple orchard, partly on a sloping grassy bank, dotted with large trees and patches of brushwood, and commanding a view as extensive as lovely. The peasantry, in their bright colours and picturesque costumes—the white tents—the bands of music—the clear ringing laugh of young girls and children as they danced on the green, dressing themselves fantastically up with wild flowers, or swinging on the branches, all was like a page in an old poem. All the higher classes in the town and neighbourhood attended, and none, I am sure, saw anything in the rustic mirth around that could disgust a heart not closed to natural feelings by vanity and false refinement. Grandfathers and grandmothers, fathers and mothers, children and grandchildren, were all there *together*—happy in the happiness of each other, and content with brown bread and water.

The French are a light-hearted people, ever open to mirth, and ready to forget that sorrow which, when it first falls on them, they seem totally unable to control, as the following little anecdote will show:—A cobbler, who called himself a shoemaker, and occasionally worked in the latter capacity, had a strikingly pretty wife: her lovely face, gentle voice, and perfect, though small and delicate figure, attracted my attention, and as they lived near us, I often stopped to speak to her. He, a short,

* This curé was a very fat man, remarkably so. Those who are old-fashioned enough to read, or are old enough to have read, 'The World,' 'The Idler,' and those bygone periodicals, may remember in one paper the story of a fat Mr Muggy, who was so lethargic, that while talking, walking, eating, and on one occasion while fighting a duel, he fell asleep. I always thought this absurd and overdrawn until I knew M. Vardon, the curé of St Victor's at Tourloville, whom I have seen fall asleep in the pulpit. He was particularly abstemious, eating meat only upon Sundays, and never, any day, breaking his fast till two o'clock; when, and once again before bed-time, he partook of a very slight refreshment. He looked blown up, was very pale, suffered much, and died at forty-two: it was disease.

broad, red-haired, coarse man, was apparently very fond of her, and all the world allowed that she was virtuous, and the couple perfectly happy: her mother lived with them as servant, an arrangement not unfrequent in Normandy, and the three were a united family. At last the wife became ill, faded gradually away, and died before her husband was aware that her case was hopeless. His despair, I heard, was frightful to witness; so much so, that they had to watch lest he should destroy himself. I went to see him about a week or perhaps ten days after her death.

'Ah, Mademoiselle Dora,' cried he, sobbing piteously, 'you knew my wife—my little wife—my pretty wife—my gentle, good, pretty Perette; but you did not, you could not know how I loved her. I loved her—ah!—so much—ah, oh, oh!—that—that I keep—ah, ah, agh!—I keep her mother still with me—oh!—and I will keep her for Perette's dear sake till—ah!—till—oh!—till—ah, ah, agh!—till—I get another!' Six weeks after he did get another, a great, stout, bold-looking dame; 'who could do her own work,' he said, 'and a far finer woman than poor Perette!' I confess I heard with satisfaction that shortly after she led him a sad life, and that her strength and activity did not make amends for her want of temper.

Among the gayest people at Tourloville was Madame de Fauconnière, whose daughter, married to the Baron de Bois Favort, usually spent four or five months at the Château de Bois Favort; a seat situated six miles nearer the sea than Tourloville, and although in the actual possession of the old General de Bois Favort, so certain to descend to his nephew, that the latter had already laid out a great deal of money upon its improvement. Until it was really his, however, he would not build, but was contented with what remained of the ancient château—an old, black, high tower—the farm-offices, and a lately-added long, low cottage, in which were a good dining-room, and a drawing-room large enough to contain library, billiard-table, musical instruments, and every piece of furniture conducive to comfort. Store-rooms and garrets where the servants slept were above; the family occupying the tower, where, half-hidden under ground, was the large, dark, curious dungeon-like kitchen. Madame de Bois Favort was a most accomplished woman—played, sung, drew like an artist—spoke Italian, English, German, and a little Spanish—and was well read in her own country's literature. Although eminently handsome, and universally admired, she always quitted Paris without regret—nay, rejoiced when the time came for going to Bois Favort, where she could dress carelessly, and do as she pleased—walking, riding on pony-back, visiting the cottages, feasting on the old-fashioned dishes of her childhood—such as *Pois tirés*, *Pois de Prud'homme*, *Crevettes à la Normande*; and all this till her husband, who annually paid a visit to his mother near Nice, joined her after a time, and then more ceremony was necessary.

I wish I had power to describe the long and lovely drive by which I first approached this beautiful place; the slopes, thick underneath with brushwood, and crowned with large high trees; the green meadows; the cherry orchards; the apple-trees, in full blow, lining the narrow lanes; the old-fashioned black and white farm-houses, formed of wood and clay, peeping out from among the fruit-trees under which the cows grazed; the little gardens full of roses, especially large cabbage yellow roses, so perfect this year, that you had to inspect them closely before you could convince yourself that they were real, not artificial; the numerous beehives; the little patches of grass and grain (for here no vineyards marred the view)—all in union—formed a scene of peace and prosperous rustic life which the memory loves to linger on, while the distant sight of the Seine here and there gave life to a *coup d'œil* which, otherwise without water, might have been what a keen old Scotch lady described a similar prospect in England to be, in answer to an Englishman

who asked her if it was not a 'sweet scene'—'Oo ay, vairy sweet; dead sweet!' The voice of birds, however, was wanting here, as well as in every other part of France I have resided in; the little bird-pies, delicious as I thought them, would, I think, have ceased to gratify my palate, had I known at the time I was feasting that robins, bullfinches, linnets, and all the sweet woodland tribe I had loved and listened to from a child were there entombed. The scene, however, was lovely; and when the black tower of Bois Favort loomed in the distance, backed by the forest of Bois Favort, it only added a kind of grandeur to what before was perhaps too soft. It had been of considerable extent in former times, but at the present day, all that remained habitable was one tall tower, and the farm-offices, which last had been fully kept up and added to, to fit them for the future building which is to restore Bois Favort to its pristine splendour, and for which all the family were then laying by money. This fine old fortress was situated in what had been a park, as one or two gigantic trees and an old cedar, larger than the largest at Fountains Abbey, attested. It was now, however, laid out in a large garden—kitchen and flower garden united—full of healthy young shrubs, and fruit-trees, peas, beans, raspberries, strawberries, gooseberries, to say nothing of cabbages and turnips.

The garden at Bois Favort contained a profusion of these common légumes, but they were almost hidden from sight by the art with which espaliers and treeroses were placed between the beds where they grew and the broad gravel-walks, that were kept as neat as those of an Oxford college garden. Indeed from one point of view I used to fancy the old tower and offices, screened by the fine trees, in all the luxuriance of the fresh June foliage, very like some peeps at Oxford—a town I never visited without wishing myself a fellow. There was no want of beautiful plants and shrubs—lilacs, laburnums, hawthorns, acacias; or of rare exotics or large orange-trees—oleonches, and myrtles in pots. Decayed leaves, withered branches, or weeds, were never seen; and every vegetable was removed before it could possibly become offensive. A pretty but very tiny brook fed a fishpond or small lake, on which danced a gay little pinnace; and alleys of peach-trees led to a bowling-green, so well drained, and yet so shaded, that it was never either burnt up or damp. Lime-trees, cut so as to form an arcade, fenced it round, whilst behind them rose others which shot up as nature bade them, all alive with bees, wild and hived, and butterflies of every hue. Every turn brought you to something new—a strawberry bank, a fig-tree grove, a green arbour, or a vine-trellis, loaded in its season with purple grapes, the largest I ever saw out of a hothouse.

At the farm-office there were the same neatness and order: everything in repair and in its place; and the poultry of all kinds, horses, cows, and even pigs, looked as if they were washed with soap and water twice a week at least so exquisitely clean were their plumage and skins. Gardeners and labourers all wore white night-caps and clean blue blouses, and the female assistants high caps, and red short-waisted cotton gowns, tucked up to show the striped petticoat underneath. All were fat, rosy, and cheerful in their appearance, respectfully familiar in their manners. They seemed really to serve their masters from love.

Lest this unusual picture of a French château may be supposed drawn from imagination, I beg to assure the reader that it is circumstantially true; but Bois Favort, so far as my experience goes, certainly stands alone. The first time I saw it was at a ceremonious dinner. High-sounding were the names of the guests, various and well-cooked the viands. Instead of the repast being placed on the table, as is the custom in small parties, a dish and its accompaniments at a time, or, as in larger parties, entirely on the sideboard, from whence it is carried round, while the table itself is covered with flowers, ornaments, and the dessert—all was put down at once, which afforded a specimen of French manners I might

otherwise have never met with. Happening to choose a *côtelette* with mushroom sauce, the Marquis de la Tarellerie, near whom the dish was placed, after smiling in a most gracefully-insinuating manner, to intimate how gladly he obliged me, with his lordly finger and thumb placed the nicest upon the plate which was held by the servant. No one looked surprised. No wonder the French of all classes use napkins; for excepting the most refined, everybody fingers what a well-trained footman with us would use his fork to. The enormous quantity these good people devoured was incredible: ladies as well as gentlemen tasted of everything, all the time looking so graceful, dressed with such charming simplicity, and talking so—in short, as Frenchwomen only can talk: a talk that is perfect as far as it goes, though it does not go far we confess.

After dinner, we agreed to return to the garden, and come back late for our coffee. There we found all the workmen of the place ready to assist in the various kinds of amusement—rowing, swinging, bowling, duck-hunting on the lake, cow-milking, and carp-feeding. One carp ate out of my fingers—a personage known to have gone by the name of the Old Carp a hundred and nine years ago. Not only did the peasants dance, but we danced with them. One little man, Petit André, a *tailleur d'arbres*, took leaps that would have won admiration from Vestris himself; and seeing the astonishment he excited, he exerted himself so much, that we were apprehensive he would break a blood-vessel. His face was peculiarly plain; the way he grinned when he shot up most amusing; and when a very handsome young lady complimented him upon his agility, it seemed to me as if his India-rubber mouth, the ends of which retreated out of sight, must have met behind. This was conspicuously the case when the said damsel presented him with a five-franc piece as a reward, she said, for being so charmingly ugly. After this *bal al fresco*, a pretty little girl came forward to recite some couplets, composed by her father upon the occasion of Madame de Bois Favort's fête—that is, not the anniversary of the day she was born, but that on which she was made a Christian, and named after one of the numerous saints in the calendar; for that saint's day is the fête celebrated after the manner we keep our birthdays. Then the others came forward without hesitation or shamefacedness. Most of them made a speech in prose or verse, and all offered their bouquets with a grace our honest English labourers could never attain. Lastly, we the guests presented our bouquets, as these little offerings are termed, which may be a bouquet or a brooch, a piece of music, a book, or what you please. One urchin presented a small sucking-pig, which caused great laughter, as he could not get it to remain silent during his speech; and the more sly pinches he punished it with, the louder it squeaked. When it came to the turn of the gentlemen to speechify, I could not help asking myself if an Englishman *could* ever bring himself to utter such fulsome flattery without blushing, or, indeed, if it could enter his head to frame such compliments as I then heard. I think not; for plain-spoken John Bull, even upon the occasion he feels most and does most, says least.

Afterwards, I passed a fortnight at Bois Favort, a happy, peaceful time, engraven for ever as a green spot in memory's waste. Our rides through the forest upon forest ponies, and saddles that might have been made in the days of the namesake of my pot-bellied Bucephalus, Henri Quatre—our visits to the lone cottages and their simple inhabitants, who, till then, I thought had only lived in the pages of romance—our mornings under the fresh boughs, surrounded by forest flowers—our reading aloud while others worked or sketched—our musical evenings afterwards—or, on a rainy day, our striking up at five minutes' notice a blazing wood fire, and drawing ourselves close to it as cozily as in winter—our visits to the farmhouses—our church-goings even—the whole is so unlike anything else I ever saw before or since, that sometimes I think I

must have dreamt it all. When M. de Bois Favort arrived and brought a friend with him, our dress and dinners were more *récherchés*, our walks directed to less wild scenes, our rides performed on horses of education and refinement—all very pleasant, but wanting the poetry of my happy, happy fortnight with Aménède de Bois Favort alone. Upon Sundays and saints' days we attended the little old church, and this was always a lovely summer scene. The situation was a little elevated, and from it you could observe the venerable old people and healthy young ones streaming through every wood, across every meadow, along every lane, to the house of God, to which they were summoned by the tinkle, tinkle, of its little bell. There was not much of the 'pomp and circumstance' of architecture there, and the interior was as unpretending as its gray, moss-grown outside, although ornamented, as well as the simple worshippers who attended could afford, by loads of flowers and many a quaint picture and misshapen saint; while the doll which represented the Virgin Mary was attired in what the worthy *comères* no doubt thought very fine, but which anywhere else would have been ludicrous. All was very clean, very well ventilated, and had a fresh perfume from the flowers, which were everywhere in profusion, that was delightful; and the remembrance of which, with the broken voice and benevolent face of its aged priest, answered by the silver tones of the little chorists, often comes back to me, and invariably brings calm and Christian thoughts and feelings. The good man's sermons were suited to the understandings of his audience, but he was, I believe, a very learned man, and in happier times might have been selected to fill a more exalted position; but as it is, the church is kept down, and has nothing to give, so he lived on at Bois Favort contentedly from youth to age, and in noway regretted the state of life to which it had pleased God to call him; on the contrary, he expressed himself grateful for being placed where he had no temptation to *pride*, that besetting sin of all the human race. I took my own prayer-book, and regularly read my own prayers, but attended with pleasure to the sermon, from which I always derived instruction. After mass, Madame de Bois Favort invited the Abbé de Belcostel to dine with her, so he directed the whole of the young ones to come to the château, and show the Protestant lady how well they knew their catechism. There was one little fellow, of eight years old, with a face like a full moon, and a figure like a Bacchus on a barrel, bearing the very appropriate name of Jean Beuze (or Buse *buzzard*, as I persisted in calling it), who was pointed out to me as the most perfect in his answers, so I called him, and found that as far as words went, he could reply without hesitation, and so rapidly, that I could scarcely follow him.

'But, mon cher petit perroquet, do you understand all that you repeat so glibly?'

'No, madame; I don't enter the understanding-class till next year.'

The curé solved the problem: as soon as all the words were thoroughly committed to memory, they then recommenced operations, and had every sentence fully explained to them; and Jerome Beuze, who had reached the mature age of eleven, was forthwith commanded to explain, which, according to Roman Catholic ideas, he did very clearly, the first twelve pages. The little class then read a portion of the story of Joseph and his brethren, and the elder ones the 5th chapter of St Matthew's gospel, after which the curé blessed them. Madame la Baronne rewarded them with apples and raisins, and they departed laughing, dancing, and singing. It was a pretty sight; and although they evidently looked up to Monsieur le Curé with great respect, they were quite as much at their ease with the benevolent old man as with a father. My friend Jean Beuze served mass, as it is called, and amused me much by the delight his rosy countenance assumed when it was his turn to ring the little bell during the ceremony,

evidently agitating it twice as much as there was any occasion for, and stopping at last with a look of reluctance.

We did not always walk or ride in slouch bonnets; we sometimes made calls, and drove *bien chaussées et bien gantées* to several *maisons de campagne*, for I can scarcely call them *châteaux*: they all appeared to me comfortless and half-furnished, the grounds round the house in sad disorder, the servants half taught, and the inhabitants themselves with a sort of not-at-home look about them that proved how much against the grain is living in the country to the French. They can spend a day there with pleasure, and talk sentimentally about woods and waters, fields and flowers; but to make the country their *home*, take pleasure in country pursuits, and surround themselves at the same time with refined comforts and intellectual amusements, or even with schools, soup-kitchens, &c. for their poor dependents, as many otherwise commonplace country ladies do with us, is, so far as I know, only understood in England, where home feelings and pursuits are cultivated by all. I greatly enjoyed those drives through this lovely country, and the sweet little pictures we often unexpectedly came upon. Here it was a rude image of the Virgin inscribed, 'Etoile du matin priez pour nous,' placed in the hollow of an aged oak, with peasants, laden with sticks from the forest, kneeling before it: there a Calvaire, and a mother teaching her infant child its prayers on the steps that led to it. Sometimes, peeping through the leaves, you descried a small gray chapel almost in ruins, telling of days gone by when piety was more common with those rich enough to rear such edifices, lowly though they be, than it is now; and often an image of St Hubert near a sparkling spring-well, holding an inscription which invited Messieurs les Chasseurs (that is, shooters of wrens and robins, as well as nobler game) to quench their thirst with the cool pure water, and thank that God who makes 'rivers run in dry places.'

I really found it difficult sometimes to believe I was living in the go-ahead nineteenth century; but all poetry disappeared when we came near a *maison de campagne*, the property of some M. Duval, or Dubois, or Fouché, who always added its name to his own, and very often sunk his own in that of his *propriété*, were it even no larger than a tablecloth. One gentleman, who had no land, ridiculed his neighbour's pretension; and when a retired tobacconist left a card for him as Monsieur Duval de Rocher, because he had purchased a *bicoque* perched upon a rock, returned his own, printed M. Satis de Sans Terre. Simplicity and poetry fled at the sight of a *paratonnerre*, which is always attached to a country-house: there things were backward enough, it is true, but not in an agreeable way, and a most unpleasant revulsion of feeling always ensued when I saw one. At one very good substantial house, the monsieur showed us how clever he was in turning the chimney-place of the dining-room into a meat-safe, where hung—'I saw it with these eyes'—a leg of mutton, two fowls, and a piece of veal. Another remarked apropos of a new stove for the same apartment, how pleasant it was to heat a pâté, or even dress a dish, at the same time that you warmed your room. Almost everywhere, either in the dining-parlour or the ante-room, you saw a *fontaine en toile*—a basin and towel—in order that the gentlemen guests might wash their hands before dinner, if so disposed. There never seemed any one to take care of our horses or donkeys, or answer the door, which was usually wide open; it being expected that you would find your own way to the kitchen, which is always near it, and make inquiries as to madame's being visible or not; and I have really seen this in houses where there was no excuse for such careless habits, and where there was neatness enough in the gardens and shrubberies to lead you to look for different customs.

One grand *château* we visited when the family unluckily was absent; but we walked about the grounds,

which were truly magnificent. Long alleys of limes and elms, diverging like rays from a centre, closely clipped half-way up, and the rest left to nature, had a very fine effect, and must have involved a great deal of expense; for every grass-plot was smoothed, and the flower-beds well attended to; statues were there in profusion, obelisks, pieces of made-water rock-work, &c.; and the branches were as thick as a hedge, and as evenly cut. I asked to see the house, and it was a very fine one, containing curious and beautiful things, many of which had been there for several centuries. The kitchen was immense; there were three hundred copper saucepans and lids hanging up against the walls, all as bright as gold; but the cheerful English fireplace, so bright and tidy, was wanting: and in spite of the handsome carving, fine mirrors, and pieces of furniture, and even one or two good paintings, there was the want of an air of home comfort, which I never discovered our show-places to have, till I compared them with this, and one or two other fine houses I have seen on the continent. I was very sorry the De M—s were absent on a visit. Had they been at home, I should have been able perhaps to form a more correct judgment. The stairs, halls, and corridors, were entirely without carpets or stoves; but as it was summer, both may have been only temporarily so; and the enormous fortune of the D. de M— makes it probable that such necessary cold-weather comforts would not be denied, even *à la campagne*.

The *Château de la Tarellerie* was also a fine place, and had fine capabilities; but there was even there a want of order and comfort, and a make-shift appearance about many things, which I never observed at an English nobleman's residence. We dined there twice; the dinner and style of reception were faultless, and the house was like a colony. The mother of the marquis had her apartments, a married son his, an unmarried son his also; and all these lived constantly with the Tarelleries in Paris as in the country; as did likewise an old, deaf, cross aunt, who had been a beauty, and had never married, her *fiancé* (whom, however, she had only once seen) having been beheaded in the grand Revolution. A married daughter and her husband were on a visit, and Mademoiselle de la Tarellerie la jeune, to distinguish her from her aunt, was to accompany them in a journey to England, and upon her return, to become the wife of the Baron Palamede de Caux, without relinquishing her home; as her *present* portion was a privilege to remain there with her husband. Instead of maiden ladies living, as with us, in a small lodging in a village, or young people taking up house for themselves, it is common in France for them all to have apartments in the *château* or *hôtel* of the head of the family—an explanation of the immense size of the *hôtels* of Paris, which are, in fact, neither more nor less than family lodging-houses. The amenity of the manners abroad renders such a plan less dangerous to domestic peace than it would prove with us, who have a greater love for independence than for society.

THE REV. WILLIAM LISLE BOWLES,

A POET whose name has long been familiar with the public, died on the 7th ult. at Bremhill, in the county of Wilts, where he had passed the larger part of his life.

Upon the northern coast of Somersetshire, on a part of the shore which trends round to the west, so as to form a bay open in that direction, a promontory called Brean Down juts into the Severn Sea. In an angle formed by the promontory of Brean, on the west side of the river Axe, stands the village of Uphill. An abrupt eminence rises on one side of this village, and upon its summit is the small parish church. Uphill village beneath is well sheltered by trees on one side; upon the other the hill rises, bare of foliage, but covered with fine turf. The opposite side of the same hill is bounded

by precipitous rocks which extend to the sea. The parsonage, deservedly admired, lies in the valley, and is surrounded by a flourishing plantation, made by the Rev. William Thomas Bowles, the father of the poet, who was the rector of Uphill and Brean prior to 1786. This parsonage is said to have been the birthplace of the poet who has just expired, and who, according to report, had attained the patriarchal age of eighty-nine.

The church may be further noticed, because it was a favourite spot with the poet, commanding a view of a very extensive character; in fact a noble panoramic circuit, including a most interesting combination of land and ocean. It is small, and has a low tower, white-washed, in order to serve as a more conspicuous landmark for vessels. There are some ancient tumuli near the churchyard, which must have added to the associations engendered in the mind of the young poet, locally attached to a spot of no common attraction by the ties of early recollection.

The family of William Lisle Bowles had been eminently clerical. His grandfather, Dr Bowles, was the vicar of Brackly, in Northamptonshire, and his father, as stated, had been rector of Uphill and Brean. The family was originally of Wiltshire stock, and is reported to be of ancient standing in that county. The mother of the poet was Bridget Grey, one of the three daughters of Dr Grey, the author of 'Memoria Technica,' a 'System of Mnemonics,' a 'System of Ecclesiastical Law,' and several other works. Mrs Bowles presented her husband with seven children, of whom the subject of the present notice was the eldest. The name of Lisle was bestowed upon him because it was borne by the old Everley family in Wiltshire, into which family Dr Bowles, the poet's grandfather, had married—a family now, it is believed, extinct.

The poet was placed at Winchester School in 1776. In 1780 he was senior boy, a place he could not have attained without great diligence in study. He was afterwards entered at Trinity College, Oxford, where the brother of the master of Winchester School, Dr Thomas Warton, happened to be tutor and fellow. Here young Bowles wrote a Latin poem on the siege of Gibraltar, which obtained the chancellor's prize, and was publicly recited in the university. In 1792 he took his degree as master of arts, but soon after quitted Oxford, in consequence of his father's death, and taking orders, accepted a curacy in Wiltshire. Five years afterwards, he married Miss Wake, daughter of a prebendary of Westminster of that name, and was soon afterwards presented by Lord Somers with the living of Dumbleton, in Gloucestershire, of the value of £360. In 1803 he was made a prebendary of Salisbury cathedral, and in 1805 was presented by Archbishop Moore with the living of Bremhill, near Chappenharn, in Wiltshire. Here he resided until the time of his decease, performing the functions of a parish priest, attentive to the duties of his station, and highly respected as a zealous minister, and a pleasing and accomplished writer.

In the life of such an individual it is not possible that there should be any stirring incident to attract attention; and we have therefore only to consider the biography of the writer in his works.

Bowles did not make his appearance before the public as a poet until three years after Rogers had published his first poems, and five years after the sonnets of Charlotte Smith had attracted so much of the public attention; namely, in 1789. The commendations which his *Fourteen Sonnets* received were well merited. Their

author was twenty-eight years of age—in this respect resembling Rogers, that the earlier productions of both were not the offspring of any remarkable precocity, but rather of the care and study bestowed on their labours by accomplished men of mature years. It is worthy of remark, too, that both poets arrived at a far advanced age, while others—Thomas Campbell, for example—who astonished the world by precocious writings, on arriving at the age at which Bowles and Rogers began to attract public attention, seem to have exhausted their powers, and fallen into premature bodily decay. The sonnets of Bowles are perhaps, of all his works, the most poetical and pleasing. They had the merit of commanding unqualified praise from the best judges of the day in which they appeared. Coleridge spoke highly of the excellent disposition of Bowles, who was his senior by nearly a dozen years. He was justly of opinion that no models of ancient times have the same vivid effect upon the mind as the works of cotemporary genius. He made more than forty transcriptions of the sonnets for others when he was only seventeen; and he ascribed his deliverance from destruction by his study of metaphysics to the effect the sonnets of Bowles produced upon his mind—by 'a style so manly, so natural, real, and yet so harmonious and dignified.' It sounds strangely to us who survive, that a poet who expired only a week or two ago, should have been but a little later in date before the public than Cowper with his 'Task.' They were the only two poets who had as yet combined natural thoughts with natural diction among the writers of that time, for the 'Pleasures of Memory' appeared subsequently. Bowles' sonnets have the merit of greater nature, and less of the artificial mode or mannerism of the day in which they appeared, than those of Charlotte Smith, although the latter is greatly before all preceding writers in this respect. It was the moment when the poetry of the century was shaking off the shackles imposed by the schools upon truth and nature. The four first sonnets are upon localities in the northern counties; the fifth is 'To Evening'—a fair specimen of the manner and feeling that pervade them all:—

'Evening! as slow thy placid shades descend,
Veiling with gentlest blush the landscape still,
The lonely battlement, and furthest hill
And wood—I think of those that have no friend;
Who now, perhaps by melancholy led
From the broad blaze of day, where pleasure haunts—
Retiring, wander 'mid thy lonely haunts
Unseen, and watch the tints that o'er thy bed
Hang lovely, to their pensive fancy's eye
Presenting fairy vales, where the tired mind
Might rest, beyond the murmurs of mankind—
Nor hear the lonely moans of misery!
Ah, beautiful views! that hope's fair gleams the while
Should smile like you, and perish as they smile!'

In the same year in which the sonnets were published, the 'Verses to Howard, on account of his description of prisons,' were published, inscribed to Dr Warton. These are harmonious and elegant; but there is too much of the personification of the virtues or qualities, 'ghostly quiet,' 'full-furnished agony,' 'pale affection,' 'dark despondence,' and 'hollow-eyed despair.' There is also much alliteration, but the feeling is good and amiable. Another poetical effusion which followed this was entitled 'The Grave of Howard.' It is marked by the mild, equable spirit of its author, but wants force and pathos. The 'Verses on the Philanthropic Society' are superior to those on Howard, but afford a similar picture of a mind wedded to the charitable and endearing virtues rather than to the enthusiastic or energetic. There is none of the severely-faithful portraiture of Crabbe in the descriptions of Bowles. He is more inclined to accommodate the shows of things to the desires of the mind, than to content himself with painting nature in the nakedness of social deformity. His sonnets went through five editions in eight years—a remarkable proof of their captivating effect, notwithstanding that Charlotte Smith's had passed through four edi-

tions in two years. There is a marked difference between these writers, so as to show, on the most cursory view, that the sonnets of Bowles are more in unison with the canons of poetry established since that time.

'Hope,' an allegorical sketch, is a very pleasing poem in imitation of Collins; but his 'Song on the Battle of the Nile' was a failure, almost as great as Southey's attempts at the celebration of public triumphs. Scenes of peace are best described by those who enjoy them, and who have mingled little on the world's great stage, nor witnessed the din of arms and shock of battles. The mind of Bowles was imbued with the love of tranquil nature—with the peaceful, kind, and beneficent. His verse never soars high: its flight is even. He pleases, but nowhere astonishes. Hence some of his shorter pieces best display his mental tendencies. All was kindness and philanthropy. The unfortunate girl, the ill-used chimney-sweeper, the gipsy, the unpitied mendicant, the unhappy of every age and of all time, seem to have had his deepest sympathy. How should such a writer, who would rather have wept with those that wept, than rejoiced with the happiest—how should he sing becomingly of war and strife, of gory fields, and the exhibition of the passions that make demons of mankind?

Bowles seems to have had a great friendship for Rogers; and he, too, it would appear, is destined to survive almost all the sons of the muses who for the last three-fourths of a century have adorned his country. Is he destined to depart the last of his kind—*ultimus suorum moriatur*? Bowles inscribed to Rogers his 'Melodies of Remembrance.' How full of kindly feeling were his lines to the memory of Byron—how different from the rancour expressed by Southey when the great poet was beyond the region of earth, when there was no fear of the clay-cold hand lifting the pen in reply! It is refreshing to turn to the lines of Bowles, so kind, so Christian:—

* I will not ask and Pity to deplore
His wayward errors, who thus early died;
Still less Child Harold, now thou art no more,
Will I say aught of genius misapplied;
Of the past shadows of thy spleen or pride;
But I will bid the Arcadian cyprus wave,
And pluck the laurel from Peneus' side,
And pray thy spirit may such quiet have,
That not one thought unkind be murmured o'er thy grave!

The 'Villagers' Verse Book' consisted of a series of short poems, intended to be got by heart by poor children at Bremhill. The object was to describe in the smallest compass everything connected with the most obvious images in country life, and to inculcate in simple language early feelings of humanity and piety. These pieces all bore simple and familiar titles, and were not calculated to be learned as a task, so much as by the attraction of their easy, simple flow of language and familiar manner.

The 'Spirit of Discovery by Sea,' first published in 1804, was the poem with which the author seemed to have taken most pains. It was nearly recomposed after it was in the printer's hands on the return of the proofs, and, as sometimes happens under such circumstances, the lines in many places were not improved. There is something sharp about the first effort or intention of the pen, which care will not improve in insulated passages, although in the aggregate the labour bestowed is always effective. This poem wants interest with the generality of readers, especially with those who are roused only by novelty, and stimulated to admiration only by extravagance of fancy. The subject, it may be objected, is too historical for poetry, and in this sense there may be some ground for impugning the poet's choice. But he is very dull-souled indeed who does not derive great pleasure from the beautiful passages and charming touches of description which sparkle through the poem. These will be readily appreciated by all who feel an interest in natural scenes, in descriptions of ocean and shore, of daring keels, and of 'cities of the sea' now no more.

The next important poem of Bowles is 'The Missionary,' inscribed to a nobleman whose seat is near Bremhill, and at whose magnificent mansion the feeling of Mæcenas towards literary talent seems inherited. The Marquis of Lansdowne, equally the friend of Bowles and Moore, who both resided at no great distance from Bowood, has to lament the loss of the social qualities of both—the former stricken by the hand of death, and the last in a state of health which gives little promise of restoration. The 'Missionary' is a pleasing poem, but it has little to interest; and its allusions to modern scenes and times are somewhat out of place. The 'Grave of the Last Saxon' is likewise a pleasing poem—the subject purely imaginary. In 'Banwell Hill, a Lay of the Severn Sea,' we have a species of polemical dissertation with reflections on the moral and religious state of parishes generally, past and present, which are better subjects for prose than poetry.

But Bowles not only exhibited himself as a poet: he became a disputant, and that not always on the successful side. It was natural that he should defend public schools and their ancient system of discipline and flogging; for he had upheld the principle in his poetry that the barbarism of the darker times of Europe, when joust and tournament settled the question of right and wrong, when trial by battle was the law of the land, and chivalry, as it was called, sustained itself in full glory—he had upheld that this was the foundation of all that was excellent in the present time. An attack he made upon Brougham and the 'Edinburgh Review' for censuring the system of education in the old grammar schools was not very happy. He relied too much upon existing prejudices, because they were those of the day in which he lived, and in which his fathers had lived before him.

Bowles, having in 1807 published a new edition of the works of Pope, in which he hazarded his reputation as an editor by some severe remarks upon the poetry and morals of that poet, became involved in a controversy which drew into its vortex a number of very distinguished personages among the literati. Campbell began the combat by some remarks upon the low scale in which Bowles seemed inclined to place the poetry of that distinguished writer, belonging to what was called the 'Augustan age of England.' Bowles rejoined, but Campbell kept out of the future part of the contest, which has been thus described with curious brevity:—'Bowles wrote a book upon Pope. Campbell abused Bowles' book upon Pope—Bowles wrote an answer to Campbell's abuse of Bowles' book upon Pope—Byron wrote a letter to some people in Albemarle Street in answer to Bowles' answer to Campbell's abuse of Bowles' book upon Pope. Jeremy Bentham wrote upon the subject. Bowles wrote an answer, not to Jeremy Bentham, but to Byron, in reply to his letter to certain persons in Albemarle Street in answer to Bowles' answer to Campbell's abuse of Bowles' book on Pope.'

The contest which Bowles thus caused related to what were styled by him the 'invariable principles' of poetry. If these, as thus laid down, were admitted, Pope must be degraded from the position he has so long maintained. The interest attached to the question was considerable. None but those denominated the 'Lake School of poets' could have stood their ground in public estimation. Moore took the best view of the matter, and said that neither side was right. The 'principles,' so called, of Bowles were not new: they had been long before canvassed in Italy and Germany. Bowles was too unqualified in the rules he laid down in his criticism on Pope. His argument was, that images drawn from the sublime and beautiful in nature are more poetical than those drawn from art; that the passions of the human heart, as belonging to nature in general, are of themselves more adapted to the higher species of poetry than those resulting from transient manners. This is reasonable enough to be admitted even by the party which Campbell led; but unfortunately Bowles pushed

his 'principles of poetry' too far. He gave, in effect, no weight to the skill and power displayed in working up the materials; but said that the presence of the mere images was to determine the merits of the poet. According to him, therefore, the *Venus de Medicis* could not be natural, being a statue composed of the most perfect portions of the female form—too perfect to exist in any one natural being; and because not existing in nature, they could not be poetical. Byron, Bowles, Bentham, Campbell, Roscoe, and Gilchrist, were involved in this controversy, which will constitute a portion of literary history. The contest began in 1818-19.

Bowles conducted himself in this dispute with great temper; but that was not the case at a later period, when Roscoe of Liverpool again touched upon the subject. Bowles, so mild and gentlemanly, then attacked the philosopher of Liverpool with an acrimony that showed he had for a moment forgotten his natural character; especially as Roscoe was, like himself, a man of the most amiable temper, and of the gentlest manners.

The rank of Bowles as a poet is not of the higher order. He is seldom found much above the line of mediocrity; his verses are the production of a virtuous and reflective mind, deeply imbued with sensibility, little excited by passion, and susceptible of good rather than lofty emotions. The 'thoughts that breathe, and words that burn,' are not to be found in his verses. He is tender, but rarely or never impassioned. His path is in the sunbeam or the cloudless moonlight—regular, calm, contemplative. Ever sedate, he has no skill in humorous sallies; he never plays with his subject; he never startles, but he almost always pleases. He enlists the social affections of the reader, and engages on his side the kindlier feelings of the heart; he is ever natural, often graceful, accurate in his descriptions of country scenery and objects, without being tedious; he never falls into silliness in search of simplicity, but is always manly; he deals for the most part in realities; but sometimes, though not very successfully, he has recourse to supernatural machinery, which, in these days of matter of fact, is dangerous ground.

The poet was fond of gardening and planting, for which he possessed much taste; he greatly improved the grounds of his rectory. In all the relations of life he was blameless; his attention to the doctrines of his church and to his clerical duties was unremitting. He rather professed what are called high than low church tenets, and had a particular antipathy to dissenters of all classes, except the Moravians, who won his regard by the mildness and inoffensiveness of their conduct. He was a great reader of controversial divinity, and perhaps went too far into that unprofitable labyrinth—that 'confusatory' of dead labours.

The poet was in the commission of the peace for the county of Wilts, and always exhibited a most assiduous attention to his magisterial duties. He once nobly braved the censure of the rustic bench in the cause of justice and humanity, by openly remonstrating against a sentence of unparalleled severity, which had been passed upon a female by one of his brother magistrates for a trifling theft. The conduct of Bowles on this occasion met the full approbation of Lord Lansdowne, then Secretary of State for the Home Department, as well as of numbers who had never beheld the poet in their lives, and were never destined to do so.

It was a custom with Bowles to pay an annual visit to the metropolis, in order not to drop behind in his intercourse with the great tide of existences, or the knowledge that is continually receiving fresh accessions in so vast a community. He used to observe that he never went back afterwards without some enlargement of mind, some increase of knowledge; but, above all, not without a double zest for those pleasures which he alone who is acquainted with and truly loves a country life knows how to appreciate. Conscientious in all things, he felt that in his brief annual absences he

might be the cause of some omission in his parochial duties, and he never failed to examine scrupulously into all such possibilities upon his return, believing that his calling was only a trust for others. In the same kind spirit in which he lived, he expired.

AGRICULTURAL ENTERPRISE IN SWEDEN.

THE account, in our number for March 9, of the temptations held out to British enterprise and capital in agricultural enterprise in the island of Gothland, has brought us a number of inquiries for further information. To prevent as much as possible the necessity for such applications, we have now to announce that in the part of the *Journal* for May, we shall print upon the cover as much additional intelligence as we can obtain, probably including a report from an intelligent East Lothian farmer, who, in consequence of our remarks of March 9, has gone to make personal examination of the lands offered in Gothland. These, it will be understood, are gratuitous services towards both the parties offering lands and the British farmers who may desire to know more about this new field of emigration. We profess of course no profound skill or insight as to the eligibility of Gothland; but all who know us will, we trust, believe that we have no object of our own to serve in calling attention to it.

We have meanwhile to bring before our readers some notices of a remarkable effort towards agricultural improvement which has been for three or four years in progress in Scania, the southern district of continental Sweden. This is a lowland district, of the latitude of southern Scotland and the north of England, lying very conveniently for intercourse with Denmark and Hamburg, and within three days' sail of Hull by steamers. In former times, when forming part of the kingdom of Denmark, it was a fertile, highly-cultivated province; but after being, in 1658, attached to Sweden, it became almost depopulated, and was allowed to fall into a state of nature, mainly because of the ascendancy which the mining and timber interests have hitherto had over those of agriculture in the Swedish legislature. It is to be hoped that better principles are now about to prevail in that country. Meanwhile the general appearance of Scania, after passing across a very narrow belt around the coast, is that of a country blessed by God, but ruined by the bad economical arrangements of man. The way is often nothing more than a wagon-track over wide uncultivated fields covered with brushwood, heath-plants, and those huge granite blocks which, according to geological speculation, the moving ice of ancient times brought in vast quantities from the north, and deposited here. The thinly-scattered hamlets, consisting of miserable farm-houses, are surrounded with some acres of corn-land, beyond which all is waste, or fit to serve only for pasture.

In 1845, Count Reventlow, son of the eminent Danish statesman who effected such important agricultural reforms in his own country sixty years ago, and brother of the present Danish ambassador in England, bought an estate of 11,500 acres in the midst of this wilderness, fully thirty miles from the nearest seaport. We must here quote from our informant, a Danish gentleman residing in England:—'The soil must generally be described as good, the subsoil being clay, in some parts mixed with gravel, and in a few parts sandy; but agriculture was, at the time of the purchase, in the very lowest state. What the father as legislator did for a whole kingdom, the son as landlord has done for his new property. In only two hamlets on the estate the

tenants had their own arable land around their home, all possessing in common some pasture-land more than one Swedish mile* distant from the hamlets. In a third hamlet nearly the same arrangement had recently been made, so as to give each tenant his separate arable-land around the farmhouse, some separate meadow-land for haymaking in another distant locality, and all the tenants a common field for pasturage. All the rest of the peasant-lands, forming the greater part of the estate, was held by the tenants in community, so that around each hamlet a small field was fenced in and cultivated by the inhabitants in common, each tenant reaping as his part the produce of perhaps from twelve to sixteen different and distant bits of land, each bit often only a few yards broad. Broad tracks led from the hamlets to the common pasturage fields, which were used not only by the tenants of this estate, but of those of several neighbouring estates likewise, so that these commons or heaths extended over several square miles, uninhabited, and looking like a part of a wild country. In those deserts the cattle were turned out; only the milking cows were attended to, kept together, and in the evening brought home by the cow-herds of the several hamlets. Horses and oxen were sent for only now and then, chiefly when they were required to bring the timber from the woods to the seacoast, the plough being used but sparingly. It was often very difficult to find the animals in those widespread tracts, where they wandered about under the oaks and beeches, or were hidden in the brushwood of alders, junipers, and other shrubs. It often occurred that a peasant, having for some days sought in vain for his beast in the vicinity of the hamlets, put a bag with a week's provisions on his back, and set out into the wilderness to search for the missing animal, which sometimes was found alive, but as often dead, having ventured into some unknown bog or moor. All the land cultivated by the tenants for their own use in 1845 did not amount to more than 1250 acres, and the three manors had 470 acres under the plough.

As the tenants, in this wretched state of things, could do little besides raising a scanty subsistence for themselves, the estate was productive of very little to the landlord; indeed the rent consisted solely in a small amount of occasional labour. The chief revenue was derived from the woods, which, after all, were used in a way the reverse of economical. The moral state of the district was also wretched, there being scarcely such a thing as regular education, while all old customs and superstitions were religiously clung to. It appeared from old maps that not the least change had taken place in the disposition of the fields since the beginning of the last century. But it is not to be wondered at, says our authority, that no improvement had taken place in that interval, 'as each tenant in a hamlet (partner of the hamlet corporation) was bound to sow and reap, whether the soil or the corn were fit or not, on the day fixed in the hamlet-law, or by the majority of the corporation. This might prove inconvenient, and seem unjustifiable; but such had been the use and custom of their fathers, and their grandfathers, and the fathers of their grandfathers, and those, they said, "were old and wise people, who had experience, and knew how it ought to be." The clothing and food of the people were most miserable. When they, in the summer, were cultivating the fields or the manors, they often stayed there the whole week, from Monday morning till Saturday evening, passing the nights in the barns, and bringing with them their scanty provisions of bread, cheese, and milk, which were replenished only once during the week; nevertheless, they worked heartily, and with cheerfulness. Their tools were in accordance with the rest, and their horses only ponies: better ones have since been introduced from Denmark.'

In taking possession of the estate, the problem which the new proprietor might be said to have before him

was, how to raise the revenue in proportion to the purchase-money. 'The first reform introduced was to give leases for life to the tenants of those two hamlets in which each farmhouse was surrounded by its own land, stipulating for a certain yearly rent in money; and to give similar leases, but only for five years, to the tenants of the third hamlet, where the land to some extent was appropriated to single farmers, but in a way which could not be allowed to continue. With a view to educating them for their future destination as farmers, all the other peasants were obliged to agree to do a certain amount of labour in the fields of the manors, and to pay some inconsiderable rent in money.

'Meanwhile, during the first summer, the difficult and delicate task was performed of making out from old documents, and fixing by surveyors, the boundaries, first, of the whole estate, and second, of the lands belonging to the several hamlets and manors. The tracts of woodland most fit for real forest culture were at the same time marked out, to be preserved in as regular and compact figures as possible. Finally, the single allotments were marked out to the single tenants of the hamlets, so that each farmer got his own land in one compact piece, in size adapted generally to his skill and means. This was for the most part done by dividing the land of each hamlet into a number of allotments equal to the old number of tenants and farmhouses in the hamlet; but new farms were also formed out of the land, and used only as pasturage, or not used at all. It then became necessary to remove many buildings, to build new ones, and to place others on the waste fields. Many settlers, several from Denmark, were called in, as the allotments generally were small, most of them about fifty acres, but many smaller, and some of not more than six acres.

'On the large uncultivated fields, which were sure to become parts of the manorial lands, a commencement had been made in this summer by draining, clearing away trees, shrubs, and roots, and rolling together in a heap, or carrying away, the large blocks of granite scattered over the surface. The whole of these preparatory labours could not be completed in the first summer; but the scheme nevertheless was fully planned out, a great deal of land divided into regular allotments, and contracts concluded, generally for fifteen years, partly with the old tenants, partly with new settlers. The yearly rents, that were to be paid in money, were lowered for the first years, in proportion to the quality of the soil, and to the improvements and breaking of new land stipulated for in the contracts: in some cases the first years were to be free of rent. It was not before the spring of 1846 that the whole might be said to have been arranged in the way described above. But at that time a number of the farmers, who had in this manner risen from labourers or servants, holding their places only at the will of the proprietor, to become farmers holding their lands for a longer series of years, made a still further progress, by buying their farms, the greater portion of the purchase-money to be retained under mortgage for a fixed period, unless the buyer chose to pay the whole earlier.

'With the arrival of this second spring, 1846, an activity and life began, so different from the past, that people believed themselves surrounded by quite another population. Trees and shrubs were cleared away; stones and granite-blocks were blasted, dug up, and removed. The stones were then used for the farm-buildings, and in greater quantities for fences, which for miles and miles were erected around the fields and the forests. The forests were for the future, to be regularly attended to, no grazing being allowed in them. Buildings were pulled down in one place to be rebuilt in another; and new ones were constructed. And when, in the fine summer evenings, the sound of hammers and axes became silent, the evening bell of the only church having announced the time for rest and prayer, the air was in all directions seen filled with smoke from the numberless heaps of green turf and roots grubbed up, collected, and set

* About seven English miles.

on fire; the ashes to be spread over the surface as a nutriment for the corn to be sown.

'The results of this activity have been most delightful. Where before nothing met the eye but moors and bogs, the desolate resorts of pewets and snipes, or monotonous fields covered with shrubs and stones, in such multitudes that one might leap from one to another, there the smiling corn-field now yields its rich produce to the cultivator, whose heart is filled with mixed feelings of self-satisfaction and thankfulness. Whole landscapes, enlivened by neat country-houses, have made their appearance.'

'The following statistical data will give some idea of the progress made in the first five years of this great undertaking:—On ground hitherto uninhabited, 120 larger and smaller houses or homes have been erected; amongst these two schools, each for 100 children, and each provided with a master trained and examined at one of the public training seminaries. The population has increased 17 per cent., without taking into account the multitude of labourers, who, from the neighbouring districts, are called in at certain periods. Three manors now cultivate more than 1800 acres instead of 470. The revenue in the present year is 70 per cent. higher than that of 1845, and next year it will be 100 per cent., and in 1856 not less than 150 per cent., higher. In this account the revenue of the two of the three manors, which are cultivated by the proprietor himself, is not included, nor that of the woods; but merely the rents and duties, stipulated for in the leases and purchase-deeds.'

These results are the more remarkable, that the Holstein war has considerably enhanced the value of capital in Denmark, raising money to 6 per cent., besides absorbing no inconsiderable portion of the energy of the nation. Such difficulties, however, are of little force in cases of this kind, when the true key to industrial exertion has been found. The enlightened proprietor set out with the design of giving the people a genuine interest in the results of their own industry. With that principle working in behalf of his plan, all has been comparatively easy. He has now the certain prospect of seeing in a few years a beautiful and lucrative estate where formerly there was only a wilderness. Can we doubt that, by similar means, similar changes could be effected not merely in other parts of Sweden, but in certain equally hapless parts of our own empire?

RECOLLECTIONS OF A POLICE-OFFICER.

THE WIDOW.

In the winter of 1833 I was hurriedly, and, as I at the time could not help thinking, precipitately despatched to Guernsey, one of the largest of the islands which dot the British Channel, in quest of a gentleman of, till then, high character on the Stock Exchange, who, it was alleged, had absconded with a very large sum of money intrusted to him for investment by a baronet of considerable influence in official quarters. From certain circumstances, it was surmised that Guernsey would be his first hiding-place, and I was obliged to post all the way to Weymouth in order to save the mail packet, which left that place on the Saturday evening, or night rather, with the Channel-Island mails. Mr — had gone, it was conjectured, by way of Southampton. My search, promptly and zealously as I was aided by the Guernsey authorities, proving vain, I determined on going on to Jersey, when a letter arrived by post informing me that the person of whom I was in pursuit had either not intended to defraud his client, or that his heart had failed him at the threshold of crime. A few hours after I had left London he had reappeared, it seems, in his counting-house, after having a few minutes previously effected the investment of the money in accordance with his client's instructions, and was now,

through his attorney, threatening the accuser and all his aiders and abettors with the agreeable processes that in England usually follow sharply at the heels of such rash and hasty proceedings.

My mission over, I proposed to retrace my steps immediately; but unfortunately found myself detained in the island for nearly a week by the hurricane-weather which suddenly set in, rendering it impossible for the mail or other steam-packets to cross the Channel during its continuance. Time limped slowly and heavily away; and frequently, in my impatience to be gone, I walked down to the bleak pier, and strained my eyes in the direction in which the steamer from Jersey *should* appear. Almost every time I did so I encountered two persons, who, I could see, were even more impatient to be gone than myself, and probably, I thought, with much more reason. They were a widow lady, not certainly more than thirty years of age, and her son, a fine curly-haired boy, about eight or nine years old, whose natural light-heartedness appeared to be checked, subdued, by the deep grief and sadness which trembled in his mother's fine expressive eyes, and shrouded her pale but handsome face. He held her by the hand; often clasping it with both his tiny ones, and looking up to her as she turned despondingly away from the vacant roadstead and raging waters, with a half-frightened half-wondering expression of anxious love, which would frequently cause his mother to bend down, and hurriedly strive to kiss away the sorrowful alarm depicted in the child's face. These two beings strangely interested me; chiefly perhaps because, in my compelled idleness, I had little else except the obstinate and angry weather to engage my attention or occupy my thoughts. There was an unmistakable air of 'better days' about the widow—a grace of manner which her somewhat faded and unseasonable raiment rendered but the more striking and apparent. Her countenance, one perceived at the first glance, was of remarkable comeliness; and upon one occasion that I had an opportunity of observing it, I was satisfied that, under happier influences than now appeared to overshadow her, those pale interesting features would light up into beauty as brilliant as it was refined and intellectual.

This introduces another walking mystery, which, for want of something better to do, I was conjuring out of my fellow-watchers on the pier. He was a stoutish, strongly-set man of forty years of age, perhaps scarcely so much, showily dressed in new glossy clothes; French-varnished boots, thin-soled enough, winter as it was, for a drawing-room; hat of the latest *gent* fashion; a variegated satin cravat, fastened by two enormous-headed gold pins, connected with a chain; and a heavy gold chain fastened from his watch waistcoat-pocket over his neck. The complexion of his face was a cadaverous white, liberally sprinkled and relieved with gin and brandy blossoms, whilst the coarseness of his not overly-clean hands was with singular taste set off and displayed by some half-dozen glittering rings. I felt a growing conviction, especially on noticing a sudden change in the usual cunning, impudent, leering expression of his eyes, as he caught me looking at him with some earnestness, that I had somewhere had the honour of a previous introduction to him. That he had not been, lately at all events, used to such resplendent habiliments as he now sported, was abundantly evident from his numerous smirking self-surveys as he strutted jauntily along, and frequent stoppings before shops that, having mirrors in their windows, afforded a more complete view of his charming person.

This creature I was convinced was in some way or other connected, or at anyrate acquainted, with the young and graceful widow. He was constantly dogging her steps; and I noticed with surprise, and some little irritation, that his vulgar bow was faintly returned by the lady as they passed each other; and that her recognition of him, slight and distant as it was, was not unfrequently accompanied by a blush, whether arising from a pleasurable emotion or the reverse I could not for some time determine. There is a mystery about blushes, I was, and am quite aware, not easily penetrable, more especially about those of widows. I was soon enlightened upon that point. One day, when she happened to be standing alone on the pier—her little boy was gazing through a telescope I had borrowed of the landlord of the hotel where I lodged—he approached, and before she was well aware of his intention, took her hand, uttering at the same time, it seemed, some words of compliment. It was then I observed her features literally flash with a vividness of expression which revealed a beauty I had not before imagined she possessed. The fellow absolutely recoiled before the concentrated scorn which flushed her pale features, and the indignant gesture with which she withdrew her hand from the contamination of his touch. As he turned confusedly and hastily away, his eyes encountered mine, and he muttered some unintelligible sentences, during which the widow and her son left the spot.

'The lady,' said I, as soon as she was out of hearing, 'seems in a cold, bitter humour this morning; not unlike the weather.'

'Yes, Mr Wat—I beg pardon, Mr What's-your-name, I would say?'

'Waters, as I perceive you know quite well. My recollection of you is not so distinct. I have no remembrance of the fashionable clothes and brilliant jewellery, none whatever; but the remarkable countenance I have seen.'

'I daresay you have, Waters,' he replied, reassuming his insolent, swaggering air. 'I practise at the Old Bailey; and I have several times seen you there, not, as now, in the masquerade of a gentleman, but with a number on your collar.'

I was silly enough to feel annoyed for a moment at the fellow's stupid sarcasm, and turned angrily away.

'There, don't fly into a passion,' continued he with an exulting chuckle. 'I have no wish to be ill friends with so smart a hand as you are. What do you say to a glass or two of wine, if only to keep this confounded wind out of our stomachs? It's cheap enough here.'

I hesitated a few seconds, and then said, 'I have no great objection; but first, whom have I the honour of addressing?'

'Mr Gates. William Gates, Esquire, attorney-at-law.'

'Gates! Not the Gates, I hope, in the late Bryant affair?'

'Well—yes; but allow me to say, Waters, that the observations of the judge on that matter, and the consequent proceedings, were quite unjustifiable; and I was strongly advised to petition the House on the subject; but I forbore, perhaps unwisely.'

'From consideration chiefly, I daresay, for the age and infirmities of his lordship, and his numerous family?'

'Come, come,' rejoined Gates with a laugh; 'don't poke fun in that way. The truth is, I get on quite as

well without as with the certificate. I transact business now for Mr Everard Preston: you understand?'

'Perfectly. I now remember where I have seen you. But how is it your dress has become so suddenly changed? A few weeks ago, it was nothing like so magnificent?'

'True, my dear boy, true: quite right. I saw you observed that. First-rate, isn't it? Every article genuine. Bond and Regent Street, I assure you,' he added, scanning himself complacently over. I nodded approval, and he went on—'You see I have had a windfall; a piece of remarkable luck; and so I thought I would escape out of the dingy, smoky village, and air myself for a few days in the Channel.'

'A delightful time of the year for such a purpose truly. Rather say you came to improve your acquaintance with the lady yonder, who, I daresay, will not prove ultimately inflexible?'

'Perhaps you are right—a little at least you may be, about the edges. But here we are; what do you take—port?'

'That as soon as anything else.'

Mr Gates was, as he said, constitutionally thirsty, and although it was still early in the day, drank with great relish and industry. As he grew flushed and rosy, and I therefore imagined communicative, I said, 'Well, now, tell me who and what is that lady?'

The reply was a significant compound gesture, comprising a wink of his left eye and the tap of a forefinger upon the right side of his nose. I waited, but the pantomimic action remained uninterpreted by words.

'Not rich apparently?'

'Poor as Job.'

'An imprudent marriage probably?'

'Guess again, and I'll take odds you'll guess wrong; but suppose, as variety is charming, we change the subject. What is your opinion now of the prospects of the ministry?'

I saw it was useless attempting to extract any information from so cunning a rascal; and hastily excusing myself, I rose, and abruptly took my leave, more and more puzzled to account for the evident connection, in some way or other, of so fair and elegant a woman with a low attorney, struck off the rolls for fraudulent misconduct, and now acting in the name of a person scarcely less disreputable than himself. On emerging from the tavern, I found that the wind had not only sensibly abated, but had become more favourable to the packet's leaving Jersey, and that early the next morning we might reasonably hope to embark for Weymouth. It turned out as we anticipated. The same boat which took me off to the roads conveyed also the widow—Mrs Grey, I saw by the cards on her modest luggage—and her son. Gates followed a few minutes afterwards, and we were soon on our stormy voyage homewards.

The passage was a very rough, unpleasant one, and I saw little of the passengers in whom, in spite of myself, as it were, I continued to feel so strong an interest, till the steamer was moored alongside the Weymouth quay, and we stood together for a brief space, awaiting the scrutiny and questionings of the officers of the customs. I bowed adieu as I stepped from the paddle-box to the shore, and thought, with something of a feeling of regret, that in all probability I should never see either of them again. I was mistaken, for on arriving early the next morning to take possession of the outside place booked for me by the coach to London through Southampton, I found Mrs Grey and her son already seated on the roof. Gates came hurriedly a few minutes afterwards, and ensconced himself snugly inside. The day was bitterly cold, and the widow and her somewhat delicate-looking boy were but poorly clad for such inclement weather. The coachman and myself, however, contrived to force some rough, stout cloaks upon their acceptance, which sufficed pretty well during the day; but as night came on rainy and tempestuous, as well as dark and bleak, I felt that they must be in some way or other got inside,

where Gates was the only passenger. Yet so distant, so frigidly courteous was Mrs Grey, that I was at a loss how to manage it. Gates, I saw, was enjoying himself hugely to his own satisfaction. At every stage he swallowed a large glass of brandy and water, and I observed that he cast more and more audaciously-triumphant glances towards Mrs Grey. Once her eye, though studiously I thought averted from him, caught his, and a deep blush, in which fear, timidity, and aversion seemed strangely mingled, swept over her face. What *could* it mean? It was, however, useless to worry myself further with profitless conjectures, and I descended from the roof to hold a private parley with the coachman. A reasonable bargain was soon struck: he went to Mrs Grey and proposed to her, as there was plenty of room to spare, that she and her son should ride inside.

'It will make no difference in the fare,' he added, 'and it's bitter cold out here for a lady.'

'Thank you,' replied the widow after a few moments' hesitation; 'we shall do very well here.'

I guessed the cause of her refusal, and hastened to add, 'You had better, I think, accept the coachman's proposal: the night-weather will be dreadful, and even I, a man, must take refuge inside.' She looked at me with a sort of grateful curiosity, and then accepted, with many thanks, the coachman's offer.

When we alighted at the Regent Circus, London, I looked anxiously but vainly round for some one in attendance to receive and greet the widow and her son. She did not seem to expect any one, but stood gazing vacantly, yet sadly, at the noisy, glaring, hurrying scene around her, her child's hand clasped in hers with an unconsciously tightening grasp, whilst her luggage was removed from the roof of the coach. Gates stood near, as if in expectation that his services must now, however unwillingly, be accepted by Mrs Grey. I approached her, and said somewhat hurriedly, 'If, as I apprehend, madam, you are a stranger in London, and consequently in need of temporary lodgings, you will, I think, do well to apply to the person whose address I have written on this card. It is close by. He knows me, and on your mentioning my name, will treat you with every consideration. I am a police-officer; here is my address; and any assistance in my power shall, in any case,' and I glanced at Gates, 'be freely rendered to you.' I then hastened off, and my wife an hour afterwards was even more anxious and interested for the mysterious widow and her son than myself.

About six weeks had glided away, and the remembrance of my fellow-passengers from Guernsey was rapidly fading into indistinctness, when a visit from Roberts, to whose lodgings I had recommended Mrs Grey, brought them once more painfully before me. That the widow was poor I was not surprised to hear; but that a person so utterly destitute of resources and friends, as she appeared from Roberts' account to be, should have sought the huge wilderness of London, seemed marvellous. Her few trinkets, and nearly all her scanty wardrobe, Roberts more than suspected were at the pawnbroker's. The rent of the lodgings had not been paid for the last month, and he believed that for some time past they had not had a sufficiency of food, and were *now* in a state of literal starvation! Still, she was cold and distant as ever, complained not, though daily becoming paler, thinner, weaker.

'Does Gates the attorney visit her?' I asked.

'No—she would not see him, but letters from him are almost daily received.'

Roberts, who was a widower, wished my wife to see her: he was seriously apprehensive of some tragical result; and this, apart from considerations of humanity, could not be permitted for his own sake to occur in his house. I acquiesced; and Emily hurriedly equipped herself, and set off with Roberts to Sherrard Street, Haymarket.

On arriving at home, Roberts, to his own and my wife's astonishment, found Gates there in a state of exuberant satisfaction. He was waiting to pay any

claim Roberts had upon Mrs Grey, to whom, the ex-attorney exultingly announced, he was to be married on the following Thursday! Roberts, scarcely believing his ears, hastened up to the first floor, to ascertain if Mrs Grey had really given authority to Gates to act for her. He tapped at the door, and a faint voice bidding him enter, he saw at once what had happened. Mrs Grey, pale as marble, her eyes flashing with almost insane excitement, was standing by a table, upon which a large tray had been placed covered with soups, jellies, and other delicacies, evidently just brought in from a tavern, eagerly watching her son partake of the first food he had tasted for two whole days! Roberts saw clearly how it was, and stammering a foolish excuse of having tapped at the wrong door, hastened away. She had at last determined to sacrifice herself to save her child's life! Emily, as she related what she had seen and heard, wept with passionate grief, and I was scarcely less excited: the union of Mrs Grey with such a man seemed like the profanation of a pure and holy shrine. Then Gates was, spite of his windfall, as he called it, essentially a needy man! Besides—and this was the impenetrable mystery of the affair—what inducement, what motive could induce a mercenary wretch like Gates to unite himself in marriage with poverty—with destitution? The notion of his being influenced by sentiment of any kind was, I felt, absurd. The more I reflected on the matter, the more convinced I became that there was some villanous scheme in process of accomplishment by Gates, and I determined to make at least one resolute effort to arrive at a solution of the perplexing riddle. The next day, having a few hours to spare, the thought struck me that I would call on Mrs Grey myself. I accordingly proceeded towards her residence, and in Coventry Street happened to meet Jackson, a brother officer, who, I was aware from a few inquiries I had previously made, knew something of Gates's past history and present position. After circumstantially relating the whole matter, I asked him if he could possibly guess what the fellow's object could be in contracting such a marriage?

'Object!' replied Jackson; 'why, money of course: what else? He has by some means become aware that the lady is entitled to property, and he is scheming to get possession of it as her husband.'

'My own conviction! Yet the difficulty of getting at any proof seems insurmountable.'

'Just so. And, by the way, Gates is certainly in high feather just now, however acquired. Not only himself, but Rivers his cad, clerk he calls himself, has cast his old greasy skin, and appears quite spruce and shining. And—now I remember—what did you say was the lady's name?'

'Grey.'

'Grey! Ah, then I suppose it can have nothing to do with it! It was a person of the name of Welton or Skelton that called on us a month or two ago about Gates.'

'What was the nature of the communication?'

'I can hardly tell you: the charge was so loosely made, and hurriedly withdrawn. Skelton—yes, it *was* Skelton—he resides in pretty good style at Knightsbridge—called and said that Gates had stolen a cheque or draft for five hundred pounds, and other articles sent through him to some house in the city, of which I think he said the principal was dead. He was advised to apply through a solicitor to a magistrate, and went away, we supposed, for that purpose; but about three hours afterwards he returned, and in a hurried, flurried sort of way said he had been mistaken, and that he withdrew every charge he had made against Mr Gates.'

'Very odd.'

'Yes; but I don't see how it can be in anyway connected with this Mrs Grey's affairs. Still, do you think it would be of any use to sound Rivers? I know the fellow well, and where I should be pretty sure to find him this evening.'

It was arranged he should do so, and I proceeded on

to Sherrard Street. Mrs Grey was alone in the front apartment of the ground-floor, and received me with much politeness. She had, I saw, been weeping; her eyes were swollen and bloodshot; and she was deadly pale; but I looked in vain for any indication of that utter desolation which a woman like her, condemned to such a sacrifice, might naturally be supposed to feel. I felt greatly embarrassed as to how to begin; but at length I plunged boldly into the matter; assured her she was cruelly deceived by Gates, who was in no condition to provide for her and her son in even tolerable comfort; and that I was convinced he had no other than a mercenary and detestable motive in seeking marriage with her. Mrs Grey heard me in so totally unmoved a manner, and the feeling that I was really meddling with things that did not at all concern me, grew upon me so rapidly, as I spoke to that unanswering countenance, that by the time I had finished my eloquent harangue, I was in a perfect fever of embarrassment and confusion, and very heartily wished myself out of the place. To my further bewilderment, Mrs Grey, when I had quite concluded, informed me—in consideration, she said, of the courtesies I had shown her when we were fellow-travellers—that she was perfectly aware Mr Gates' motive in marrying her was purely a mercenary one; and her own in consenting to the union, except as regarded her son, was, she admitted, scarcely better. She added—riddle upon riddles!—that she knew also that Mr Gates was very poor—insolvent, she understood. I rose mechanically to my feet, with a confused notion swimming in my head that both of us at all events could not be in our right senses. This feeling must have been visible upon my face; for Mrs Grey added with a half-smile, 'You cannot reconcile these apparent contradictions; be patient; you will perfectly comprehend them before long. But as I wish not to stand too low in your estimation, I must tell you that Mr Gates is to subscribe a written agreement that we separate the instant the ceremony has been performed. But for that undertaking, I would have suffered any extremity, death itself, rather than have consented to marry him!'

Still confused, stunned, as it were, by what I had heard, my hand was on the handle of the door to let myself out, when a thought arose in my mind. 'Is it possible, Mrs Grey,' I said, 'that you can have been deceived into a belief that such a promise, however formally set down, is of the slightest legal value?—that the law recognises, or would enforce, an instrument to render nugatory the solemn obligation you will, after signing it, make, "to love, honour, obey, and cherish your husband?"' I had found the right chord at last. Mrs Grey, as I spoke, became deadly pale; and had she not caught at one of the heavy chairs, she would have been unable to support herself.

'Do I understand you to say,' she faintly and brokenly gasped, 'that such an agreement as I have indicated, duly sealed and witnessed, could not be summarily enforced by a magistrate?'

'Certainly it could not, my dear madam, and well Gates knows it to be so; and I am greatly mistaken in the man, if, once the irrevocable ceremony over, he would not be the first to deride your credulity.'

'If that be so,' exclaimed the unfortunate lady with passionate despair, 'I am indeed ruined—lost! Oh my darling boy, would that you and I were sleeping in your father's quiet grave!'

'Say not so,' I exclaimed with emotion, for I was afflicted by her distress. 'Honour me with your confidence, and all may yet be well.'

After much intreaty, she despairingly complied. The substance of her story, which was broken by frequent outbursts of grief and lamentation, was as follows:—She was the only child of a London merchant—Mr Walton we will call him—who had lived beyond his means, and failed ruinously to an immense amount. His spirits and health were broken by this event, which he survived only a few months. It happened that about

the time of the bankruptcy she had become acquainted with Mr John Grey, the only son of an eminent East India merchant, but a man of penurious disposition and habits.

'Mr Ezekiel Grey?'

The same. They became attached to each other, deeply so; and knowing that to solicit the elder Grey's consent to their union would be tantamount to a sentence of immediate separation and estrangement, they unwisely, thoughtlessly, married, about ten months after Mr Walton's death, without the elder Grey's knowledge. Gates, an attorney, then in apparently fair circumstances, with whom young Mr Grey had become acquainted, and Anne Crawford, Maria Walton's servant, were the witnesses of the ceremony, which, after due publication of banns, was celebrated in St Giles's Church. The young couple, after the marriage, lived in the strictest privacy, the wife meagrely supported by the pocket-money allowance of Mr Ezekiel Grey to his son. Thus painfully elapsed nine years of life, when, about twelve months previous to the present time, Mr Grey determined to send his son to Bombay, in order to the arrangement of some complicated claims on a house of agency there. It was decided that, during her husband's absence, Mrs John Grey should reside in Guernsey, partly with a view to economy, and partly for the change of air, which it was said their son required—Mr Gates to be the medium through which money and letters were to reach the wife. Mr Ezekiel Grey died somewhat suddenly about four months after his son's departure from England, and Mrs Grey had been in momentary expectation of the arrival of her husband, when Gates came to Guernsey, and announced his death at Bombay, just as he was preparing for the voyage to England! The manner of Gates was strange and insolent; and he plainly intimated that without his assistance both herself and child would be beggars; and that assistance he audaciously declared he would only afford at the price of marriage! Mrs Grey, overwhelmed with grief for the loss of a husband by whom she had been as constantly as tenderly beloved, and dizzy with ill-defined apprehension, started at once for London. A copy of the will of Mr Ezekiel Grey had been procured, by which in effect he devised all his estate, real and personal, to his son; but in the event of Mr John Grey dying unmarried, or without lawful issue, it went to his wife's nephew, Mr Skelton—

'Skelton of Knightsbridge?'

Yes: in case of Mr John Grey marrying, Skelton was to be paid an immediate legacy of five thousand pounds. So far, then, as fortune went, the widow and her son seemed amply provided for. So Mrs Grey thought till she had another interview with Gates, who unblushingly told her that unless she consented to marry him, he would not prove, though he had abundant means of doing so, that the person she had married at St Giles's Church was the son of Ezekiel Grey, the eminent merchant! 'The name,' said the scoundrel, 'will not help you; there are plenty of John Greys on that register; and as for Anne Crawford, she has been long since dead.' Mrs Grey next called on Mr Skelton, and was turned out of the house as an impostor; and finally, having parted with everything upon which she could raise money, and Gates reiterating his offer, or demand rather, accompanied by the proposal of an immediate separation, she had consented.

'Courage, madam!' I exclaimed at the end of her narrative, of which the above is the substance, and I spoke in a tone of joyous confidence, which, more than my words, reassured her: 'I already see glimpses of daylight through this maze of villany. Gates has played a desperate game certainly, but one which we shall, you may rely on it, easily baffle.' A knock at the door interrupted me: I peered through the blind, and saw that it was Gates: 'Silence—secrecy!' I emphatically urged in a low voice, and with my finger on my lip, and left the room before the street-door could be answered; and by my friend Roberts' contrivance, I was in a few

minutes afterwards in the street, all the time unobserved by the intruder.

The next day early Jackson called on me. He had seen Rivers, but he seemed to know nothing, except, indeed, that it was quite true Gates had received a five-hundred pound draft from a house in India, which he, Rivers, had got notes for at the Bank of England. There were also in the same parcel a gold watch, he knew, and some jewellery, but from whom it all came, he, Rivers, was ignorant. Nothing but that had Jackson been able to discover.

'Call you that nothing?' said I, starting up, and hastily swallowing my last cup of coffee. 'It is enough, at all events, to transport William Gates, Esquire!'

I had to wait that morning on especial business on the commissioner; and after the business upon which I had been summoned had been despatched, I related the case of Grey *versus* Gates as clearly and succinctly as I could. He listened with great attention, and in about a quarter of an hour I left him with as clear and unmistakable a path before me as it was possible to desire. I was passing down the stairs when I was re-summoned.

'You quite understand, Waters, that Skelton is not for a moment to be lost sight of till his deposition has been taken?'

'Certainly, sir.'

'That will do then.'

Arrived at home, I despatched my wife in a cab for Mrs Grey. She soon arrived, and as much as was necessary of our plan I confided to her. Mr Gates had pressed her earnestly that the ceremony should take place on the following morning. By my directions she now wrote, although her trembling fingers made an almost unintelligible scrawl of it, that as it *was* to be, she agreed to his proposition, and should expect him at nine o'clock.

Two hours afterwards, Jackson and I, having previously watched the gentleman home, knocked at Mr Skelton's house, Knightsbridge, and requested to see him. At the very moment, he came out of a side-room, and was proceeding up stairs.

'Mr Skelton,' said I, stepping forward, 'I must have a private interview with you!' He was in an instant as pale as a corpse, and shaking like an aspen—such miserable cowards does an evil conscience make men—and tottering led the way, without speaking, to a small library.

'You know me, Mr Skelton, and doubtless guess the meaning of my errand?'

He stammered out a denial, which his trembling accents and ashy countenance emphatically denied.

'You and Gates of the Minorities are engaged in a felonious conspiracy to deprive Mrs Grey and her infant son of their property and inheritance!'

Had he been struck by a cannon-shot, he could not have fallen more suddenly and helplessly upon the couch close to which he was standing.

'My God!' he exclaimed, 'what is this!'

Perceiving he was quite sufficiently frightened, I said, 'There is no wish on Mrs Grey's part to treat you harshly, so that you aid us in convicting Gates. For this purpose, you must at once give the numbers of the notes Gates obtained for the cheque, and also the letter in which the agent at Bombay announced its transmission through Gates.'

'Yes—yes!' he stammered, rising, and going to a secrétaire. 'There is the letter.'

I glanced over it. 'I am glad to find,' I said, 'that you did not know by this letter that the money and other articles here enumerated had been sent by the dying husband to his wife through Gates.'

'I most solemnly assure you I did not!' he eagerly replied; 'until—until—'

'Mr Gates informed you of it, and seduced you to conspire with him. He has been playing a double game. Whilst amusing you, he purposes marrying Mrs Grey to-morrow morning!'

'Is it possible? But I suspected'—

'No doubt. In the meantime, you will, if you please, accompany us. There is every desire to spare you,' I added, perceiving him hesitate; 'but our orders are peremptory.' With a very ill grace Mr Skelton complied, and we were rapidly driven off.

The next morning Jackson, Skelton, and myself, were in Sherrard Street before daybreak. Mrs Grey was already up, and at eight o'clock we sat down with her and her son to an excellent breakfast. She was charmingly dressed in the wedding garments which Gates had purchased with her stolen money, and I almost felt it in my heart to pity the unfortunate bridegroom, rascal as he was, about to be suddenly disappointed of such a bride and such a fortune! It was very necessary that she should be so arrayed, for, as we had thought quite probable, Rivers called a few minutes past eight with a present of jewellery, and the bride's appearance must have completely disarmed any suspicion which his master might have entertained.

Breakfast was over: Mrs Grey, with her son, was seated on a couch in the front room, and we were lying *perdu* in the next apartment, separated only by folding-doors, when a coach drew up before the house; a bridegroom's impatient summons thundered at the door; and presently forth stepped Mr Gates, resplendently attired, followed by his man Rivers, who was, it appeared, to give the bride away. Mr Gates entered the presence of beautiful Mrs Grey in immense triumph. He approached her with the profoundest gallantry; and was about to speak, when Jackson and I, who had been sedulously watching through the chink of the slightly-opened doors, advanced into the room, followed by Mr Skelton. His attitude of terror and surprise was one of the most natural performances I ever witnessed. He turned instinctively as if to flee. My grasp was in an instant on his collar.

'The game is up, my good Mr Gates: I arrest you for felony!'

'Felony!'

'Ay, truly. For stealing a gold watch, diamond pin, and a cheque for five hundred pounds, sent through you to this lady.'

All his insolent swagger vanished in an instant, and the abject scoundrel threw himself at Mrs Grey's feet, and absolutely howled for mercy.

'I will do anything,' he gaspingly protested; 'anything you require, so that you will save me from these men!'

'Where is Crawford?' I asked, desirous of taking immediate, but not, I hope, unfair, advantage of the rascal's terror; 'she who witnessed this lady's marriage?'

'At Leamington, Warwickshire,' he replied.

'Very good. Now, Mrs Grey, if you will leave us, I shall be obliged. We must search this gentleman, and perhaps'—She vanished in an instant: her gentleness of disposition was, I saw, rapidly mastering all resentment. I carried the watch we took out of Gates's pocket to her, and she instantly recognised it to be her husband's. A fifty and a twenty-pound bank-note, corresponding to the numbers on our list, we extricated from the disappointed bridegroom's pocket-book. 'And now, sir, if you please,' said I, 'we will adjourn to your lodgings.' A savage scowl was his only reply, not at all discomposing to me, and we were soon busy ransacking his hidden hoards. We found several other articles sent by Mr John Grey to his wife, and three letters to her, which, as corroborative evidence, would leave no doubt as to *who* her husband was. Our next visit was to a police court, where Mr William Gates was fully committed for trial. He was in due time convicted of stealing the watch, and sentenced to transportation for seven years.

Mrs Grey's marriage, and her son's consequent succession to the deceased merchant's wealth, were not disputed. She has never remarried, and lives now in beneficent affluence in one of the new squares beyond

the Edgeware Road with her son, who, though now six-and-twenty years of age, or thereabouts, is still unappropriated; but 'the good time is coming,' so at least hinted a few days ago the fashionable 'Morning Post.'

LONDON GOSSIP.

April 1850.

We are getting into the thick of it once more: the blaze of balls—delights of the drama—operations of the opera—pedantry of politics—simmerings of sanitation—grumbings of gas-men—warfare of waterworks—scowlings of scavengers—travails of tradesmen—maceration of ministers, and I don't know what besides: all talked about at dinner-parties and nocturnal *réunions*, with an interminable under-current of minor twaddle. At such gatherings you may be pretty sure to hear something *pro* and *con* on the impending removal of the Royal Academy from the National Gallery—on the transference of the Vernon collection to Marlborough House—on the bas-reliefs just affixed to the pedestal of the Nelson Column; or perhaps some one wonders why Lord Rosse, the president of the Royal Society, intends to hold his soirées this season at his own residence, instead of at Somerset House. If literature comes up for discussion, you will be told that Mr Grote's 'Greece' is the history of that classic land; a fact which few will care to deny; and if the colloquists be obtuse, Thomas Carlyle gets a snubbing for his 'Latter-Day Pamphlets,' a rebuke which the said Thomas survives with exemplary and wonderful equanimity. Or perchance a neglected naturalist attracts notice by talking learnedly of the forthcoming book of Agassiz on 'Lake Superior, its Physical Characteristics,' &c. &c., and assures the company that it will be a work every way worthy of its author. Anon a dispute arises as to the new poems by new and old poets: 'Christmas Eve and Easter Day,' 'The Angel World,' 'The Roman,' and other bardic effusions, and here and there a hint is dropped that the author of the 'Princess' is to be the future laureate.

Such is one phase of gossip: taking another orbit, you get out of dilettantism into philosophy and practicalities, and here we have a host of topics all wanting to be uppermost; some to sink speedily into 'everlasting nonentity,' while a few, very few, leave a trace of their passage. If editors would be content to take things as they come, as the Irish and Cochinchinese do, we poor writers should be spared a world of trouble in arrangement. But as you are not that way inclined, we for our part must sacrifice the picturesque to the useful. So to begin:—the exhibition of Mediæval Art, at the Society of Arts, is doing good in more ways than one. It makes people acquainted with rare curiosities of workmanship, which otherwise they would never have the opportunity of seeing, and teaches them that artists and artisans of the olden time had more skill than they generally get credit for. This exhibition would require a whole chapter to do justice to it, and I can only remark in passing, that the sight of it will prove an instructive lesson to those overdone with conceit. Another subject of conversation is the recently-ventilated project for removing the railing and wall at the west end of St Paul's, and thus leave a spacious area—*place*, as the French would call it—open to the public. This, should it come to pass, will be a great convenience, facilitate locomotion, and improve the aspect of the magnificent cathedral. Another is, the bill for which the Commons have 'given leave' for the new Victoria Docks to be constructed on the Essex shore of the Thames opposite Woolwich, at an estimated cost of a million and a-half sterling. May success attend the enterprise, which comes opportunely to meet the increased activity to accrue from the alteration in the navigation laws! Another is, the new Park—a *park* for the people—breathing space—to be laid out

somewhere within the bounds of Finsbury, at an expense, as is said, of £150,000; and then the throwing open of the gardens of Chelsea Hospital for the recreation of the citizens. This is welcome as gossip, and how much welcome will it be in fact! The friends of temperance are felicitating one another on the diminished allowance of spirits to be served in the navy, and viewing it as an important step towards further ameliorations in the moral and physical condition of sailors. The Peninsular Steam Navigation Company have come to a resolution to abolish the use of spirits altogether on board their vessels, except in cases of absolute necessity: the men's pay will be raised five shillings per month by way of compensation. They intend also to establish a savings' bank and a school at Southampton; the former with a view to promote habits of economy among their crews, the latter for the training and instruction of the children belonging to the sailors in their service. There is something better in these measures than the mere making of teetotallers: a new and healthy stimulus is provided for the adult, while the young are forearmed against temptation. There is some talk among city men of the scheme, with which the same company are connected, for a monthly steam communication with Australia, and fortnightly with China, at much less cost than by the present arrangement. The route, as proposed, is to be 'from Singapore to Swan River, Adelaide, Port-Philip, and Sydney, returning thence, and calling at all the same ports on the way back,' and to be extended by a branch to Van Diemen's Land and New Zealand. If, in addition to this rapid transit, we could only get Ocean Penny Postage, what a blessing and benefit would be gained by emigrants and their relatives in either hemisphere, to say nothing of commercial correspondence! And apropos of rapid communication, we are told that the submarine telegraph from Dover to Calais is about to be realised. It is said that 'the tower for the battery, offices, and general works at Dover are nearly erected; and the insulated wires are in a forward state of progress, and are expected to be sunk across the Channel in the course of next month.' Accounts from New York inform us of a new application of thermic-electricity which has been patented for telegraphic purposes in that state. Rumour speaks of it as something extraordinary; but considering the magniloquent propensities of our oversea brethren, we must not be too ready to believe without seeing.

An attempt is at last to be made in our New Victoria Street, the Royal Road of Westminster, to build houses in floors with a common stair, and thus gain economy of space with increased stability, yet preserving all the essentials of style and of *respectability*—that phantom to which so many thousands of English people sacrifice their existence. It is to be hoped that the example—not of sacrificing, but of building—will be followed in other quarters. Talking of architecture reminds one of the improved glass for windows which has been adopted in some new houses with considerable effect, and also applied to mirrors. As the description states—'after the glass has been silvered in the usual way, wreaths of flowers and other devices are cut in the glass, and covered over with a chemical fluid. When the glass has been thus prepared, the silvering is roughly applied to the ornamental part; and when that has acquired the requisite consistency, the artist, by means of needles, works out the details of the embroidered device much in the same way as the carving-machine, on Jordan's principle, follows and works out the cutting in the model. The embroidering,' it is said, 'increases the usual price, but not so much as to preclude even the middle classes from purchasing mirrors ornamented with elegant and permanent designs.' At Mr Kidd's establishment in Poland Street, Oxford Street, we were shown some beautiful specimens of mirrors decorated in this singularly-beautiful manner. Then there is another bit of art that has been exhibiting itself in high quarters: a new American churn, which makes butter almost as fast as

cooks can use it. By this contrivance, which is very simple, the cream is so thoroughly interpenetrated by atmospheric air, that it separates from the milk with great rapidity and completeness, and without frothing. In the trial which took place a few days since at the Mansion House, four pounds of butter were made from four quarts of cream in ten minutes. What will our dairy-farmers say to this Yankee achievement? will they take a hint from it? remembering that in these times butter travels by railway. Hardly have we looked at the churn before our attention is drawn off to a 'Novelty in Printing,' which, having been exhibited and approved in Paris, now offers its pretensions to the London press. It is a mode of stereotyping with paper instead of plaster, invented and patented by Mr Worme, a French printer, and described as 'the new Rotary Press, worked by cylindrical motion, and by a stereotype obtained from several sheets of paper made in a pulp, which gives more depth than is usually obtained from plaster of Paris, and the printing is so perfect, that even maps are reproduced from these cylindrical stereotypes with the minutest accuracy.' When tested in Paris, 'the stereotype cylinder was got up in exactly fifteen minutes, and the printing on both sides was quite perfect; the speed was 15,000 copies per hour, which can be augmented by corresponding steam power. The rapidity is owing to the printing on endless paper, not wetted, put on rollers; each copy is cut off with mathematical precision. It was generally admitted by all parties that the whole was superior to anything in existence, and that the simplicity of the process, together with the economy, must form a new era and a complete revolution in printing in general, as, besides the rapidity, the saving in types is very considerable: these being only used on the pulp for the forming of the stereotype, and not worked afterwards. The Journal la Presse has given the first order, and is so well satisfied, as to have ordered a sufficient number to do the whole work of their establishment. Five hands, of which two are adults, will do the same work as fifteen men did formerly.' This description, which smacks of foreign authorcraft, has made some talk, and led to visits of inspection among the London trade. The general opinion appears to be, that the scheme will not perform all it promises. In connection with this ingenious application of paper, I may mention the 'stone cartridge paper' for roofing houses, recently invented in Germany. If we get to paper roofs, we shall, I suppose, not stop short of the Chinese pagodas said to be constructed with this impudorous material.

You probably have not seen the 'blue book' on the British Museum? It is a huge affair, comprising over eight hundred pages. Is it not a little singular that nearly all these parliamentary annuals are filled with details of mismanagement or error? If the inferences are to be believed, good government, on ever so small a scale, is an impossibility. This Museum Report, however, notwithstanding its uninviting aspect, contains some interesting matter. I shall only quote two of the financial items. One is, that the Museum buildings since 1823 have cost nearly L.700,000; the other, that since 1755 L.1,100,000 have been expended in purchases for the various departments. Among other reports which have made their appearance, as well as this of the great Bloomsbury establishment, is the City Police Report for 1849, which presents a somewhat favourable balance-sheet as compared with former years; thus:—Value of property stolen in 1841, L.9093; in 1849, L.4406. Persons taken into custody in 1841, 7785; in 1849, 5126. Summonses issued in 1841, 1378; in 1849, 3382. The increase under the last entry is said to be due to incidents arising out of the ever-augmenting traffic and business of the city, within whose limits not less than 600,000 persons enter every day; so that if the police take fewer prisoners, they have still no lack of employment. By their means, as the report further states, 743 lost children were found, and eight lives saved, during the past year.

Now, as Sawkins says in the play, I must take a promiscuous flight to foreign parts. They are discussing a project in Vienna whereby to save the city from future inundations of the Danube. The scheme is to cut an artificial channel for the river, at some distance from its present bed, which shall be from 1200 to 1500 feet wide, affording ample capacity for all the water sent down at flood-time, without danger of overflow. The Prussian government has offered prizes for the best model of a suspension-bridge, to be erected across the Rhine at Cologne, without impeding the navigation; and a prize has just been announced in Denmark which will interest sanitary folk. The object is to improve Copenhagen, by devising the best means for increasing the quantity of gas, number of lamps, and its more economical distribution to private houses—for making profitable use of the matters now wasted injuriously in drains and cesspools; and for a supply of 100,000 tons of water every twenty-four hours, fit for all public and domestic purposes, to be filtered also, and forced to a height of ninety feet. The plans are to be sent in within eight months from the 18th February last, and those approved will get the prize of 250 gold Fredericks—L.208 sterling. Besides these grand designs, there is the mighty one of boring the Alps: the formidable mountain-range is to be no longer a barrier to rapid human intercourse. The Sardinian government are about to undertake the cutting of a tunnel through Mont Genève, from Modane on the north, to Bardonecche on the south, at a height of 4000 feet above the sea-level. The tunnel is to be seven miles long, nineteen feet high, and twenty-five wide, for a double line of rails. The approaches on either side will be a series of inclines, along which the trains will be moved by water-power. Above the proposed passage-way the mountain rises 2400 feet—a massive roof, and one that will task engineering ingenuity to support it. What a treat the excavation will be for geologists! We may expect to learn some of the secrets of upheavals.

The French Academy are busy, as usual, making scientific researches and feeling philosophers. A host of subjects has come before them of late. Boubigny is pursuing his investigations into the spheroidal state of liquids in ebullition; he finds that ether assumes this form when dropped into boiling water, and has plunged his hand, moistened with this volatile liquid, into boiling water with impunity, while an unmoistened finger rapidly immersed, and withdrawn, was scalded. The experiments have been repeated and confirmed by M. Come, professor of natural philosophy at Laval. He, on plunging his hand, wetted with sulphuric acid, into melted lead, felt a sensation of cold; the reason assigned is, that this acid, when liquefied, and in the spheroidal condition, is at a temperature of 10 degrees below zero. He visited a foundry, and amused himself for two hours by passing his fingers, wet and dry, through jets of molten iron—feats in which he was imitated by a little girl of ten years old, daughter of the proprietor: she, as he reports, passed her hand harmless into a pot of incandescent metal, although it was the first time she had witnessed such experiments. The only precaution to be observed is, first to remove the scum from the surface. Another *savant* sends in a communication on the construction and directing of balloons. Another, reviewing the anomalies of temperature noticed in Europe early in January, considers 'that certain parts of France constitute a sort of thermal oasis, of which it would be interesting to discover the limits.' Another states that a leaden tube is preferable to a solid wire for lightning conductors. Another proposes a kind of photogenic paper to be used to print from, without employing metal types. Another, Docteur Mathieu, describes a machine for cutting lucifer matches: it resembles a plane with two perpendicular dividing plates, and will prepare 1200 clumps in an hour. Another, M. Lampérière, has constructed an instrument of caoutchouc—an artificial mouth, as it may be called—with a view primarily to ascertain and determine the quantity of milk-secretion in the female

breast. It is made to embrace the nipple closely, and is provided with apparatus to rarefy or exhaust the air, so as to produce a vacuum. The conclusion to which the inventor arrives, after sixty-seven experiments, is, that the secretion in each breast every two hours is from one and a-half to two ounces. He met with one instance in which the quantity amounted to nearly three pounds in twenty-four hours. Apart from the scientific application, this machine will be of great service to women in early suckling, and enable them to bring their breasts into the required condition without some unpleasant consequences to which they are now subject, and may be used to prevent inflammation by provoking a super-secretion of milk at the expense of the disease itself. Nurses, too, may draw and preserve their milk for the purpose of feeding such infants as cannot suck from the breast without danger of suffocation by choking.

Besides discussing these minor matters, the Academy have been giving away prizes and proposing others in nearly all branches of science. Dr Jackson of Boston, U. S., is to have one of 2500 francs for his discovery of etherisation, and Dr Morton a second of the same value for the first application of the discovery to surgical operations. Mr Hind of the Regent's Park observatory, Mr Graham of Markree observatory in Ireland, and Hencke of Driessen, each gets a medal—the former for discovering the little planets Iris and Flora; the second for Metis; the third for Astrea and Hebe. Two thousand five hundred francs are also awarded to M. Leclaire—the enterprising painter, whose labours have been more than once recorded in your Journal—for superseding the use of white lead by 'the preparation in bulk of white of zinc, and its application to house-painting by means of a dryer—manganese oil.' A like amount is given to M. Rocher for his 'economical machine for distilling sea-water on board ships, employing therein the heat of the culinary apparatus.' Thus you see that the Academicians aim at the useful as well as the abstruse.

There are one or two incidental facts in the late proceedings of the Institute which demand a little consideration. Frequent notices appear of the failing health of the veteran Gay-Lussac; he is suffering from ossification of the aortic valves. Arago, communicating a paper on optics, observes that he is warned by loss of health, and sudden defect of sight, to bring forth the researches which have long 'slept in his portfolios;' and Biot, in presenting some particulars relative to Laplace, observes that he is settling his house in order. *Sic omnia fatis*, &c. When once the places of these philosophers shall become vacant, it will not be easy to fill them again.

You will perhaps remember my telling you a short time since of the project for having an independent prime meridian in the United States; some attempt was made to excite the national pride by insisting on the honour of not reckoning longitude from Greenwich. A good deal of discussion arose among astronomers and naval men in the States on the subject; the entire uselessness and inconvenience of the change have been exposed, as well as its fallacy, for the new point was to be one exactly 90 degrees west of ours; so where would be the independence? A memorial against it has been numerously signed by men competent to judge, and presented to Congress, and their remarks will doubtless give the scheme its quietus. They say—'We can perceive no reason for abandoning the meridian of Greenwich, or any other of the common property of civilisation. If the use of the instruments of art, or the methods of science, introduced by other nations be beneficial to us, the most high-minded and truly independent national spirit would seem to dictate, not that our practices and usages should be changed, but that we should, by the cultivation and advancement of branches of knowledge, where our efforts can be useful, repay to mankind the advantages which we have received from the common stock of civilisation.'

BIRD LIFE.

Oh! a lovely life is the life of a bird,
The little winged lute of the summer air!
Fleeing lightly away with the speed of thought
From the gloomy haunts of fear and care:
Yet bound still to earth by a bright golden thread,
A love-linked chain from its own sweet nest,
That guides it safe home from its wildest flight
To the tiny nook of its dear one's rest.

It has soared from our sight: but a viewless harp
Fills with its gladness the summer air,
Awaking within our listening hearts
The thousand echoes that slumber there.
We may trace its path through the distant space,
By the stream of song that marks its way,
Like some radiant star in the midnight skies,
Whose course we track by its golden ray.

Oh! a lovely life is the life of a bird!
A life of gladness, and hope, and love.
Ever viewless when singing its sweetest song,
Sweetest when soaring the highest above.
Bearing ever within, in its loving heart,
The source whence its joyous lay is given;
Its life a beautiful hymn of praise,
A music-path, bounded by home and heaven.

C. T.

A RAGGED SCHOOL.

The following is an anecdote taken from the journal of one who conducted a Ragged School:—Finding it impossible to get the children to attend our school in the forenoon, we determined upon changing our hours to half-past six in the evening. We commenced our new plan on Sunday, November 26, when we had upwards of 200 children and youths in attendance. Under all circumstances their behaviour was good during the greater part of the evening. About ten minutes to eight o'clock, however, there was a signal given by some of the boys, and instantly there was a move in all parts of the room, and a rush made to the staircase. The superintendent was amazed at this proceeding: recovering from his surprise, however, he darted across the room, and was just in time to catch the last one ere he reached the door. Twenty-one had already made their exit. The boy who was caught struggled hard to get away, and loudly cried, 'Let me go! let me go!' But holding him fast, the teacher replied, 'When you have told me what this plot means, you shall.' 'I want to go to business,' said the boy. 'Business; why, it is Sunday night!' 'Never mind, you let me go,' continued the lad. The superintendent still held firm. 'Well, I'll tell you the truth, sir: do you see it is eight o'clock?' The teacher looked at the clock, and nodded assent. 'Well, sir, we catches them as they comes out of church and chapel.' A policeman now entered. 'Where,' said he, 'did you get these boys from? they are every one of them convicted thieves!'—*The Rookeries of London.*

INTELLECTUAL POWER MISAPPLIED IN LITERATURE.

Think what a glorious power is that of expression; and what responsibility follows the man who possesses it! That grace of language which can make even commonplace things beautiful, throwing robes of the poorest texture into forms of all-attractive loveliness: why does it not expend its genius on materials that would be worthy of the artist? The great interests of man are before it, are crying for it, can absorb all its endeavour, are indeed the noblest field for it. Think of this—then think what a waste of high intellectual endowments there has been in all ages from the meanest of motives. But what wise man would not rather have the harmless fame, which youths, on a holiday, scratch upon the leaden roof of some cathedral tower, than enjoy the undeniable renown of those who, with whatever power, have written from slight and unworthy motives what may prove a hindrance rather than an aid to the wellbeing of their fellow-men?—*The Claims of Labour; an Essay, &c. 1844.*

'THE FOURTH ESTATE.'

IN the seventeenth century, it was the pulpit which greatly moved the masses of men; now it is the press. For weal or for wo there cannot be a doubt that the journals of this country exercise a vast amount of influence over society; in France, their power is even more strikingly manifested, and so it always must be, we apprehend, the more the people are cast loose from their usual anchorages, and sent upon the finding out of new ways. Even the degree of influence which the journals possess in England becomes a serious question, when we reflect that it is a power acting under none of the usual checks or responsibilities. A clergyman is answerable to his bishop or his synod; a member of parliament to his constituency. Teachers of almost all kinds and grades are subjected to some sort of test. The newspaper alone is free. This is an immense point in its favour, whether for good or evil to the community. It is an entire novelty too in social machinery.

The difference between the bond and the free systems of teaching is, we think, very easily detected. In the bond system, all violent aberration and mischief is repressed, but the penalty of this is mediocrity of effect. Under the free system, we have fearful fountains of corruption opened, but we have at the same time brilliantly-energetic action, and, on the whole, grand results. Now, if teaching through churches and academies, and by other regulated methods, be strictly co-ordinate with teaching through unlicensed journals, a problem must be in time wrought out by their contrasted action. It will either be discovered that the writer should be responsible to some central authority, connected or unconnected with the state, as all other teachers are, or that these other teachers, if they are to maintain themselves in equal efficacy with the unlicensed writer, must be equally free. Even now the question may be put, Why should any person be able to address hundreds of thousands of his fellow-citizens over the whole country every week, or every day if he pleases, without any restraint whatever, when it is impossible to teach twenty boys in a university, or undertake the cure of three hundred souls, without a paralysing amount of responsibility? The two systems cannot always co-exist. The one must in time overflow and absorb the other.

The press, after all, has its restrictions, but of a kind which does not in the least interfere with the above remarks. A journal is under the check of public opinion. The public writer has to assume a virtue if he hath it not, because his readers would otherwise desert him. His faith may be greatly different from that of the multitude, but he is compelled to keep it in the recesses of his own bosom, if he would avoid giving his readers offence. He is thus forced to adhere to certain

standards of feeling and opinion, without having ever been asked to sign a test or take an oath. If it be found that public opinion can produce such results in the literary teacher, it will in time be asked if it may not be sufficient in that of all other instructors. It is here assumed that the one system does not in the least tend more to induce an identity between the real and the professed opinion than the other.

The press being so important a power—being, in fact, rather than by mere jocular sobriquet, a fourth estate—it is of consequence that it should be morally raised as high as possible. Its moral status cannot be said to be low in this country. It has one great and shining virtue in a superiority to personalities. With comparatively few exceptions, and those only of particular classes, there is a spirit of fairness and veracity in the press. We have often had occasion to observe with pleasure, when individuals had made themselves conspicuous by some gross offence, with what good feeling towards relatives the newspapers conducted themselves. These are amiable and respectable features. That party views are in general advocated with temper, and that none but those which are really defensible, and therefore legitimate, are advocated, must also be allowed to the credit of the English press. It must nevertheless be admitted that the *personnel* of the press is far from being in a satisfactory condition.

The fact is, that the journals themselves have alone a recognised personality in England. We ask what is the opinion of the 'Times' on the subject? how the 'Chronicle' has written? and whether the 'Examiner' and 'Spectator' may be expected to take up the question strongly? The human beings whose hands hold the pen in certain dingy back-rooms of the offices of those papers are not thought of at all. The writers of articles for a paper are not always known even to each other. Were we to hear their names mentioned, we should be as much in the dark as before, for the men have, in general, no social status of any distinction. It is therefore the paper, not the writer, which is amenable to the check of public opinion. All this is primarily a matter of consideration for the board of proprietors, whose pockets are liable to be affected by it. Now here, we think, lies the dark and painful feature of the English press. The fundamental maxim of all ethics—the responsibility of the individual—is wanting. He is merely a mouthpiece. He is only a representation of a human judgment and a human heart. He may write one way for one paper, and another way for another, without anybody knowing of it. The temptation to do so must often arise, and must often be yielded to; at least, in the obscurity which invests him, we have no security that he will resist it. It will not do to say that, provided he adheres to the standards of feeling and opinion which are sanctioned by the

public, or by some respectable portion of it, there is no occasion for complaint. The diversity that exists between the inward mind of the writer and the demonstrations he makes, is an evil in itself which we must put up with only in as far as it cannot be helped. The less of it the better; and what we believe is, that it is increased immensely by this system of sinking the personality of the writer in that of the journal.

The journalists themselves feel that their position is a false one, and one of the outcries of the day is for a right acknowledged place in the state to those men whose intellects exercise so great an influence in its affairs. It cannot be surprising that this clamour should be heard, for only consider how it must affect a man's mind to hear society ringing with some powerful article which he has written, and yet to know that he is only one of the multitude of Smiths or Wilsons living in certain rows of houses, of democratic uniformity, in Camberwell or Camden-Town, and that, while the daily labour no more than suffices for the daily wants, his life must continue to be one of obscure toil. The English journalist looks across the Channel, and sees his brother in Paris a distinguished political figure, whose standing for a place in the national legislature is beheld as a fitting part of the system of things, and who may even aspire to be a minister of state. Suppose Smith or Wilson of the 'Daily News' or 'Morning Herald' were to stand for the Tower Hamlets, what a shout of universal ridicule would salute his placards! Why does it look so natural in Paris and so foolish in London? It is because the French journalist asserts his own personality, while the English sinks his in that of his journal. A newspaper proprietor may stand for a seat in parliament, if his wealth and character place him amongst the class who ordinarily take that position; but the author of the thunder which daily issues through that gentleman's paper—he is only an obscure hireling—for him to pretend to any such position would only be to expose himself to a derision which would never afterwards perhaps cease to attach to his name.

It seems to us that what is required to give the public writer in England the true position which he is now groping for, is identical with what is necessary to perfect the condition of the English press. We must see and hear MEN preaching to us, not papers. Let the journalist issue his daily or weekly discourses with his name, and he must soon obtain a personal distinction and a place in society appropriate to his deserts. If he becomes a great Voice for counsel and instruction, he must rise in the social scale. His name will be courted for lists of directors and patrons. If it become convenient for him to ask the suffrages of a parliamentary constituency, his doing so will appear as quite in the right course of things. And this must be precisely because, in the avowal of his personality, he gives a guarantee to society for his conduct. We think all this so clear, that we wonder at its not having been seen long ago.

Our argument may be met perhaps with the assertion that the English press is as moral as it can possibly be. On that we join issue. While, as before, fully admitting its many merits, we see several points of sordidness and unconscientiousness, such as could not exist in any profession where individuals were socially recognisable. We pass over many matters connected with advertisements, though these may be said to form the grand snare for the honesty as well as dignity of the press, and pitch upon one part of London newspaper practice less remarkable perhaps, but sufficiently reprehensible.

All the London journals profess to criticise theatricals. They must professedly do so, in order to make the public aware of what is doing in the theatrical world. They must professedly mean to do it, not in a spirit of favour to the theatrical managers, but in a spirit of truth, as for the benefit of their readers. It may be at once admitted that the theatres are fairly liable to this criticism; but assuredly they are not to be expected to pay anything in order to facilitate the newspapers in performing a part of their ordinary duty. Nevertheless, the newspapers demand from the managers free admission for their critic—a demand with which the latter are obliged to comply, in order to avoid giving the newspapers offence. This we think an unjust tax, if ever there was one. Granting that there might be shown some ground of claim for the admission of one person, it surely never could be thought necessary for the business of the newspaper that it should have free admission for more? Yet how stands the fact? Each London newspaper claims admission for two persons at all times. They also expect to be now and then favoured with an entire box, on which occasions the editor or publisher, or some persons connected with the office, will attend with their whole families. There is even one paper of unusual power which claims from each theatre the privilege of writing out an unlimited number of orders of admission for any night's performance! If it be considered that there are upwards of fifty journals in London, the amount of this tax will be seen to be not small. If it be further considered that the theatrical profession is pre-eminently a struggling one, an estimate of the humanity attending the imposition may be formed. The poor manager is forced to submit, because he cannot afford to incur the hostility of the press. On his best nights he must quietly see a large part of his house filled with emissaries of the press, to the exclusion of those who would pay, and not unfrequently to the annoyance of his proper customers; for it is a peculiarity of the system that it throws into the boxes persons whose proper position is the gallery. Now this is surely a grossly-unconscientious use of power. While such an abuse exists, and while newspaper conductors remain, to all appearance, unperceptive of its real character, we must continue to regard journalism in England as something less pure than it ought to be, and not entitled to any more honour than it at present receives.

To talk of newspaper writers coming forth with a recognisable personality may appear visionary. Our business, however, is to point out where we think the evil lies, and where the remedy might be found. If the necessary change cannot be made, we can only be sorry for the fact. But is such a change altogether hopeless? Against it there are two obstacles. One is custom. It has become a sort of rule to conduct newspapers anonymously. But in a country where Cobbett wrote for many years with his name frankly displayed on his paper, it cannot be said that we are without a precedent for the contrary. The second and greater obstacle is in the difficulty of setting up a paper. Even this would be greatly done away with if newspapers were free from duty. There would then be as little to hinder a man of talent from entering upon the career of a teacher by writing, as from adventuring upon any other profession by which he hoped to make his bread. The men of the press have been so long accustomed to the salaried condition in which they live, as to have lost nearly all sense of the value of an independent position. Slavery has, as usual, worked its worst effect in

reconciling its victims to bear with it. Were they to strain, even in the present circumstances, for the true command of the organs through which they condescend to blow, they would probably be more successful than they at present dream of, and the first taste of the edifying effect of their independence would make them wonder that they had so long submitted to their present degradation.

FANCHON.

'MICHEL,' said old Blaise Pastoror one day to his son, 'I wish I could see you lifting up your head a little, and thinking of taking another wife.' Michel, instead of lifting up his head, only shook it very sadly. 'I know well what a loss you experienced in Marguerite,' continued the father, 'and I understand your feelings. But it is now two years since she died, and it is time you began to rouse yourself from this unavailing grief. Your children are of an age to need a mother's care; my wife is growing old, like myself, and she is not equal to the fatigue of looking after the young ones; and when they choose to run away from her to the edge of the pond, or under the horse's feet, she can't overtake them.'

'What you say is true enough, father,' answered Michel; 'but where shall I get a wife like Marguerite?'

'There is no telling till you try,' answered Blaise. 'Marguerite was a good wife, a good mother, and an excellent woman in every respect; but it would be hard to think there are no more such left in the world! And I am certain if she could speak to you from heaven, where she no doubt is, that she would give you the advice I am giving you. Suppose your mother were to die, who is to take care of your children when you are out all day about the farm?'

'Well, father, I'll think of it,' said Michel. 'But I know no women. Where am I to look for a wife? If you wish me to take one, choose for me yourself.'

'Why,' said Blaise, 'there are several things to be considered. First, you must not marry a very young woman; she will be thoughtless, and neglect your children perhaps.'

'And if she's older, she may ill-treat them,' said Michel. 'For what I see, they are as likely to suffer by my giving them a mother as by wanting one.'

'We must be cautious in our choice,' answered Blaise. 'But God be thanked good women are more plenty than bad ones everywhere!'

'That's true,' answered Michel. 'I daresay Pauline or Louise Médoc, or little Catherine Sylvestre, would either of them do well enough.'

'Too young,' said the old man, shaking his head; 'too young, and too poor.'

'Young they are certainly, and poor too,' said Michel; 'but I shouldn't like to marry an old woman, and where I'm to find a rich one that will have me I don't know.'

'I wouldn't recommend an old woman either,' said Blaise; 'but one about your own age—eight or nine-and-twenty say; and as for money, if there's none in this parish, there may be in the next. What would you say to old Gerard's daughter Isabel?'

'I never saw her,' answered Michel.

'It's a good while since I saw her either,' said Blaise; 'but she was a fine-looking girl then; and being an only daughter, she will have everything her father leaves. That will be no trifle; and as he wishes to see her married—for she's nearly as old as you are—there will be no objection on his part at all events.'

'What!' said Michel; 'have you spoken to him on the subject?'

'Well, to say the truth I have,' answered Blaise. 'When you saw me talking to him at the fair last week, he was remarking that it was time you shook off your grief for poor Marguerite, more especially as you had been such a good husband, and had nothing to reproach yourself with.'

'Thank God for that!' said Michel.

'And when I said I wished I could see you married again, he gave me a hint that he shouldn't be sorry if you were to take a fancy to his girl.'

'Well, father,' said Michel, 'she is the same to me as another, for I can never love any woman again as I loved my Marguerite; so, since you wish it, I'll think about this marriage with Isabel Gerard.'

'Thinking about it wont do: you must make her think about it too,' said Blaise, 'or somebody may step in before you. You must go over to Grandpré and see her.'

'That will be a day to go, and a day to come back, and a day there,' said Michel; 'and how can I be spared just now in harvest-time?'

'We mustn't mind a day or two when there's a good wife to be got,' answered Blaise. 'Besides, to-morrow's Saturday. If you take the brown mare, and start to-morrow afternoon, you'll be at Grandpré before night; and as there's a moon, it wont signify even if you are a little late.'

So it was settled that Michel should go on the following day to Grandpré, to try if he could love Isabel Gerard; but it was with a heavy heart he made his preparations, for love so formally invited is apt to be shy: Cupid likes to pay his visits when he's least expected.

On the same evening that this conversation took place, when the children were in bed, and the rest of the family were sitting round the hearth, there came in an old woman called Barbette, who lived in a poor hut on the borders of Blaise Pastoror's farm. Twice a week they gave her broth, and she was now come for her allowance.

'Sit down and rest yourself, Barbette,' said Margot, the farmer's wife, 'and let us hear how the world goes with you.'

'Not worse than with other people I believe,' answered Barbette; 'but I'm going to lose my daughter, little Fanchon.'

'Lose her! How? Is she going to be married?'

asked Margot.

'Married! Poor child, who would marry her?' said Barbette. 'No, no; but she's going to Grandpré. I've got a situation for her there at Farmer Gerard's. It's a hard thing to part with her; but she must go to service some time; and the winter will be here soon, and if she can earn a little money, she will be able to help me through it.'

'She's such a little creature, that we forget her age,' said Margot; 'but the truth is, it is time she went to service. If she stays at home she may get habits of idleness.'

'No fear of that,' answered Barbette. 'I believe Fanchon would rather go down on her knees and scrub the stones in the high road than be doing nothing. She'll be a treasure to anybody that gets her I can tell you; and I only wish you could have taken her into your service.'

'Perhaps we may another year,' said Margot; 'but, in the meantime, it will be a good thing for her to go to Grandpré. Gerard keeps a good house, and she'll improve herself there. When does she leave you?'

'She's to be there to-morrow,' answered Barbette; 'but it's a long way for such a young creature to go alone.'

'She needn't go alone,' said Blaise. 'Michel is going to-morrow to Grandpré, and he shall take charge of her; and, by the by,' added he, 'as Fanchon is going to live with friend Gerard, she may do us a good turn; and thereupon he communicated to Barbette his hopes of bringing about a marriage betwixt Michel and Isabel, begging that, as Fanchon was well acquainted with them all, she would say a good word for the family in general, and for his son in particular.'

'She may do that with a clear conscience,' said Barbette; 'for happy'll be the wife that calls Michel Pastoror husband. I'll speak to her about it, and,

depend on it, he won't miss his mark if they'll take Fanchon's bail for him.'

Michel, who had been pacing up and down the orchard, thinking seriously of what was before him, now came in, and having learned the destination of Fanchon, he consented willingly to escort her. Accordingly, on the ensuing afternoon the little damsel presented herself at the stable-door with a small bundle in her hand, ready for the road, and having mounted behind the young farmer, they started on their journey with the good wishes of the assembled family. It was the first time she had left her poor home, and her old mother, and the young girls of her own age that she had grown up with; and whilst Michel jogged along, his mind absorbed in his own troubles, the tears were streaming down her face as she thought of those she was leaving, and the strangers she was going among. All at once Michel became aware that she was weeping. 'What's the matter, little Fanchon?' said he.

'I'm thinking of home and my poor mother,' said she, endeavouring to restrain the flowing tears.

'Ah,' said Michel, 'it makes one's heart sad to leave those we love if it's only for a short time, for one never feels sure of seeing them again. Who could have thought, when I left my poor Marguerite to go to Rouen for two days, that she would be dead before my return! And that puts me in mind that I didn't see my little Lep when I came away: where could he be, I wonder?'

'I saw him in the morning running along the high road,' said Fanchon: 'I thought you had sent him a message perhaps.'

'Not I,' answered Michel; 'but my mother may, to keep him out of the way, for he wanted sadly to come with me to Grandpré.'

'And why not have brought him?' said Fanchon. 'He's no weight, and the mare could have carried us all three; besides, I could walk a good part of the way. I love little Lep, and I should have liked to have him here with us.'

'Why, I wished to bring him, but my father said it wouldn't do to go courting with a child at my back. But I'm talking of what you know nothing about.'

'I beg your pardon,' said Fanchon; 'I do know all about it. I know you are going to marry the rich farmer's daughter that's to be my mistress.'

'Then you know more than I do,' said Michel. 'She may not choose to have me.'

'Why shouldn't she have you?' said Fanchon. 'Didn't you make a good husband to Marguerite? You're well off too, and as young as she is, for what I hear.'

'But I have three children,' said Michel.

'So much the better; it will make the merrier home. Besides, an't they the prettiest children in the whole parish, and the best brought up? For my part I think the very sight of little Lep would have won her heart at once.'

'Ay, if she likes children; but suppose she does not?'

'Pooh! if she doesn't like children, she won't like to marry you; so there'll be an end of it. But they say she's rich and handsome, and I never heard an ill word spoken of her; so you're wrong to take up notions before you've reason.'

'I'll tell you what, Fanchon,' said Michel, 'you are sharp and quick, and you are going to live in her father's house. After you have been there a week or two, you must tell me what you think of her.'

'No,' answered Fanchon; 'I won't promise that. I might make a mistake, and so do mischief.' Just as she said this the mare shied. 'What's that?' she asked.

'It's some animal in that bush,' answered Michel: 'a strayed lamb perhaps.'

'It's a child!' said Fanchon. 'Why, it's your little Lep I declare, and asleep!'

'So it is,' said Michel, alighting from the mare. 'To think of the child being here alone, and so far from home!' When the boy opened his large eyes, he was

amazed; for his father having refused to take him to Grandpré, he had set off some hours before, with the intention of watching on the road till Michel passed, and thus gaining his object; but weary with walking, he sat down and fell asleep, and now being suddenly awakened, he could not remember how he got there. Michel was angry, for he neither liked to leave the boy there nor to take him to Grandpré, and while he scolded, Lep cried. However, Fanchon, siding with Lep, the youngster carried the day, and Michel placing him on the saddle before him, on they went. The child was so delighted at first, that he forgot he had had no dinner; but they had not gone far before the jogging of the horse reminded him of his hunger.

'Didn't I tell you so?' said Michel impatiently. 'What's to be done now? I don't see a house where one could get a mouthful of bread for miles round!'

'Don't fret,' said Fanchon, quietly opening her bundle; 'I've got a bit of bread and cheese here. Take it, Lep, and eat away.'

Lep did not require to be twice invited; but Michel said, 'What will you do yourself, Fanchon, without anything till we get to Grandpré? We've a long way to go yet.'

'Oh,' said Fanchon, 'young stomachs can't wait, and mine can; besides, grief at leaving my poor mother has spoiled my appetite, and I don't want anything.'

The next thing that happened was, that as soon as Lep's stomach was full, he became so sleepy, that he was like to fall off the mare, and Michel could not guide her, and at the same time hold the child and a bag of game, which his father had given him as a present to his intended; but Fanchon said, 'Give me the game-bag, and I'll tie it to my bundle, and then you can sling them before you, while I carry the boy in my arms.'

So on they jogged in this way some miles farther, till they reached a wood which they had to pass through; but by this time it was getting late, and though the moon was rising, there arose also such a thick mist, that they could not find their way, while the horse frequently stumbled over the broken branches and the stumps of trees. After trying first one path and then another, and always finding they were wrong, Fanchon proposed that they should alight and walk, 'being nearer the ground, we may perhaps make out where we are; and while you lead the mare, I'll take care of the child,' said she. As the wood was intersected here and there by ditches and ponds, they were in less danger on their feet than on horseback, and they got on for some distance without accident; but on reaching at length a spot where the thicket terminated, they found themselves on the edge of a large marsh, which Michel knew to be in an opposite direction to the road they should have gone. So they turned back again, and made another attempt, but with no better success; and to add to their misfortunes, whilst Michel was seeking for his hat, which the branch of a tree knocked off his head, the mare slipped the bridle from his hand, and trotted off.

'What's to be done now?' cried he. 'The child can walk no further, and I'm afraid to leave you here while I go after the mare, lest I should not be able to find you again; and if we stay here all night, the child will get his death, and you too, with the cold. Besides, I'm by no means sure there may not be a wolf or two hereabouts!'

'We must light a fire,' said Fanchon. 'Here's a large oak which will keep off the rain, and I feel plenty of dry sticks crackling under my feet; and then we must make a bed for the boy, and let him sleep till the mist clears off.'

'That's easily said,' answered Michel; 'but where are we to get fire? And the mare has run off with my saddle-bags and everything we had to make a bed with!'

'I've my tinder-box in my pocket,' said Fanchon, as she set briskly to work to gather sticks; 'and we must clear a dry spot and wrap him up in my cloak.'

'And what's to become of you without it?' cried Michel.

'The fire will warm me, and I can keep myself awake,' she answered; 'but the child can't, and he'll get his death if we don't take care of him while he sleeps.'

It is astonishing what resources there are in a well-disposed, active, good-tempered woman, and how helpless, in certain emergencies, a man is beside her! Fanchon had a good blazing fire and a bed of dry leaves under the oak ready for Lep in no time; then she wrapped him in her cloak, and covered him with the game-bag, which, together with her own bundle, had slipped off the mare as she kicked up her heels and ran off.

'You must keep up the fire,' said she, 'while I watch the child, lest the sparks should reach him.'

'Upon my word you're a capital little lass!' said Michel. 'You know how to take care of a child, and to make a fire in the wood, and do everything that's useful. I was beginning to feel cross, I can tell you, at the thoughts of passing the night here in the cold.'

'And when one loses one's temper, one generally loses one's presence of mind too,' said Fanchon. 'For my part I have often been obliged to keep the sheep on the hills in cold weather, and I should have been badly off if I hadn't known how to make a fire!'

'What you say about losing one's temper is true enough,' answered Michel; 'but how to help it when things go so perversely?'

'Just remember that losing your temper will only make them worse,' said Fanchon. 'My mother and I have had many a hard struggle, but we never lost heart till it came to the parting to-day; but your mother says she'll perhaps hire me next year if I learn to be a good servant at Grandpré; so I shall keep up my courage, and live in hopes of seeing dear home again.'

'I wish she had hired you at once,' said Michel, 'instead of sending me this wildgoose chase after a wife. You could have taken care of my children as well as any wife.' But as Michel sat with his knees towards the fire opposite Fanchon, he now, for the first time in his life, as the light shone on her face, made the discovery that she was a very pretty girl. 'How old are you, Fanchon?' said he.

'Eighteen,' said she; 'but I'm so little, that nobody takes me to be so old.'

'Why, you're old enough to be married!' said Michel.

'Ha, ha!' laughed Fanchon, 'who'd marry me I wonder?'

'That remains to be seen,' said he. 'Have you never thought of a husband yet?'

'Never!' answered she. 'I'll never marry till I have a hundred crowns to begin housekeeping with.'

'But it will take you many years to save that while you've your mother to help out of your wages,' said Michel.

'But I can wait,' answered Fanchon. 'Folk that live single may die as happy and go to Heaven as fast as the married ones.'

'That's true,' said Michel thoughtfully; 'but it's better to marry.' And here he fell into a reverie, out of which he by and by awoke, declaring that he was dying with hunger, and had nothing to eat.

'Not so bad as that neither,' said Fanchon. 'As we came through the wood I plucked the chestnuts that were bobbing in my face, and when I lighted the fire, I set them on the ashes. They must be about done by this time I think; and if they're not enough for you, you can take one of the birds you brought for your intended, and I'll roast it for you betwixt a couple of stones, as we used to do the larks we caught on the hill when I kept the sheep.'

'What a brute I am, never to remember that you gave your bread and cheese to Lep! Why, you must be starving, Fanchon! I had a good dinner before I started, and yet I'm as hungry as a wolf!'

'It's all habit,' said Fanchon: 'you are accustomed

to your three or four meals a day at the farm, but I am used to fasting, and I don't miss a meal now and then.'

'That's another excellent quality in a wife,' said Michel laughing.

'But I'm not a wife, nor like to be,' said Fanchon.

Here Michel fell into another reverie. 'He'll be no fool that chooses you,' said he.

'I hope not, for I shouldn't like to marry a fool,' said she.

'I daresay you think me a stupid fellow,' said he, after a pause; 'for I can do nothing, and you can do everything. But you see, Fanchon, I was set to the plough, and to guide the oxen through the furrows, when I was but a little lad; and as I only worked on my father's farm, I always found my meals ready when I wanted them; and then I married young, and my poor Marguerite took care of me; but I've nobody to mind me now.'

'Couldn't Fanchon take care of you, papa?' asked little Lep, who had been awakened by the smell of the cookery, and was now sitting up and waiting for his share.

'To be sure I can,' said Fanchon, who was so far from thinking of Michel as a husband for herself, that she was not in the least embarrassed by the child's question; for Blaise Pastorer was esteemed a rich farmer in that part of the country, and Fanchon's mother was in a great degree dependent on the charity of the family.

'Come,' said she to Michel when he had finished his supper, 'I see you can't keep your head up to talk, so you had better lie down by the child, and go to sleep at once, and I'll watch the fire.'

'No, it is you that must lie down, Fanchon,' said Michel, 'and I'll watch you both; for I have fifty things stirring in my head, and though I were to try never so, I could not sleep a wink.'

'Fifty things! That's too many for one head,' said Fanchon merrily.

'Well, if I haven't fifty, I've one that I haven't been able to get out of it for the last two hours, and I should like to tell you what it is.'

'I think I could tell you,' said Fanchon: 'you wish you were at home, and in bed, instead of running the country after a wife.'

'A woman I never saw!' said Michel. 'I've nine minds to go back again, Fanchon. What do you say? Will you go with me?'

'I go with you!—no,' said she. 'What would my poor mother do next winter if I lose the situation she has got for me with so much trouble? And as for you, I say you'd be very wrong. Why should you take such a prejudice against a girl you have never seen? Think of your good parents too, that wish you to marry. What's your objection?'

'None, if I may choose for myself,' answered Michel.

'Wait till you see her,' said she.

In spite of her brave little heart and good spirits, fatigue began to tell against Fanchon at last, and the next time Michel spoke to her she was nodding. 'Come, my girl,' said he, 'lie down beside the boy, and rest till the morning dawns, and then I'll wake you both.' So Fanchon stretched herself on the bed of leaves, and taking the child in her arms, was soon fast asleep. Then Michel spread the cloak over her; and as he looked at her sweet innocent young face, with little Lep lying on her bosom, he said, 'Where have my eyes been all this while, that I have had this treasure under them, and never found it out? I thought she was a child; but though she's as fair and delicate as a white doe to look at, she's as hardy as a young heifer, and as tender and brave as a good woman; and that's what she is, in good faith, and a fit wife for any man. But what's this to me?' he exclaimed, turning away. 'My father and mother would never hear of my marrying her, even if she would have me.' Still, reason with himself as he would, he could not get out of his head that Fanchon was the wife to make him happy, and that he

never should be able to fancy any other. However, the rain having ceased, and the moon shining out more clearly, he by and by thought it advisable to arouse the sleepers, and endeavour to recover their lost path. Fanchon was very drowsy, and as for Lep, there was no waking him at all; but Michel took him in his arms, and they trudged away for some time in hopes of finding their way out of the wood. And accordingly, after walking for upwards of an hour, Michel exclaimed joyously that they were approaching a house, for that he saw a light shining through the trees; so they took heart, and hastened forwards; but instead of a house, they found the light proceeded from their own fire, which the breeze had blown into a flame; whereupon Michel lost all patience, exclaiming they must be bewitched; but Fanchon said, 'Come, let us make the best of it. One night in the wood wont kill us; but we must make a bed for the child again, and cover him up warm, for I begin to feel the cold air of the morning.' But though Fanchon's patience was not exhausted, her limbs were; and turning as white as the handkerchief that covered her neck, she was seized with a shivering, her teeth began to chatter, and she sunk to the ground almost insensible.

'Oh, Fanchon, my girl!' cried Michel, lifting her in his arms to the bed she had made for the boy, 'it is my fault that you are exposed to all this trouble and fatigue. I undertook to protect you to Grandpré, and I have done you nothing but mischief. But forgive me, Fanchon, and I'll make you amends for it all if you'll take me for your husband!'

'I!' cried Fanchon, somewhat recalled to herself by amazement. 'You're raving, Michel; you don't know what you're talking about.'

'I know very well what I'm talking about,' answered he; 'and I know that you're the only woman to make me happy; and that you'll be a kind mother to my children, and a good daughter to my old father and mother; so only say that you'll marry me, and as soon as it's light enough to see our way, instead of going on to Grandpré, we'll turn our faces the other way, and go back to the farm.'

'It's impossible,' said Fanchon, shaking her head. 'It can't be; so think of it no more, Michel, but go forward and see Isabel Gerard, as you promised your parents when you left them.'

'It's of no use,' said Michel; 'it would only be an affront to go and see a girl I'm determined not to marry. But why wont you have me, Fanchon? Wasn't I a good husband to my poor Marguerite? Didn't she, on her deathbed, bid me take another wife? And didn't she bid me tell her that I had never given my first one a moment's cause to regret that she had taken me for her husband?'

'I know that's true,' answered Fanchon with the tears in her eyes. 'My mother, who was helping to nurse her in her last illness, heard her say so.'

'And didn't you hear what Lep said to-night? It was the voice of my Marguerite speaking through her child!'

Fanchon, however, was not to be persuaded; and although she gave no reason, she so steadily refused him, that, quite discouraged, Michel at length ceased to speak; and while she lay down again beside the boy, he sat with his head resting despondingly on his hands till the morning broke. Then he turned to rouse her, but he saw she was awake, and that she had not slept any more than himself. Having inquired their way from an early woodcutter, they once more started for Grandpré; and as soon as they reached the entrance of the village, Fanchon stopped, and holding out her hand, bade him good-by; 'for,' said she, 'I can't go to my new mistress till I have washed my face and hands, and made myself tidy. I shall come there by and by; and in the meantime, Michel, I shall forget all you have said to me, and I hope you will marry Isabel Gerard, and that she may make you a good wife, and your children a good mother!'

'I wont have any mother but Fanchon,' said Lep.

'You sha'n't have any other,' said Michel; 'and as she wont be your mother, you shall have none.' Whereupon, bidding Fanchon farewell, he returned home with the child, while she proceeded on her way.

In certain parts of France, where it is customary for all the married, as well as the single, children and grandchildren to reside together under the same roof as long as it is possible for them to do so, there is a remarkable degree of deference observed towards the elders of the family; and thus Michel, though nearly thirty years of age, felt some misgiving at the thoughts of presenting himself at the farm without having fulfilled the object of his journey, and without being able to explain to the satisfaction of his parents the reason of his return; for to say that he had fallen in love with Barbette's little daughter, and that she had refused him into the bargain, he knew would appear to them rather a subject for amazement and laughter than commiseration. However, he was so good a son, and so worthy a man, that although disappointed, the old people did not think proper to press the matter further when he declared his determination not to marry Isabel Gerard; and they contented themselves with looking about in other directions, and recommending to his notice first one and then another fair damsel of the surrounding districts. But it was all in vain; Michel would have nothing to say to any of them; and although he went about his work as diligently as ever, everybody saw he was an altered man. Of Fanchon he heard nothing; but as there followed a very hard winter, Barbette would have suffered exceedingly, had it not somehow miraculously happened that her stock of potatoes, and flour, and firewood never diminished! It did not signify how freely she used them, she had always plenty; and although at first, fearing the devil might have a hand in the business, she had some thoughts of confessing to the priest, she comforted herself with the idea that as she had not entered into any compact with the Evil One, he had no right to expect any condescension on her part in return for his benefits. When the year was expired, Fanchon came home again; but much to the annoyance of her mother, and the surprise of Blaise Pastor and his wife, she declined to enter into their service. Michel guessed her reason, and it stung him to the quick to see how resolutely she avoided him; but it happened that while she was making inquiries for another situation, the scarlet fever broke out in the neighbourhood, and there was scarcely a house that had not one or more children in bed with it. Among the rest Michel's three children were all attacked at one time; and in such an emergency as this Fanchon did not wait to be asked—she offered her assistance at once. In spite, however, of all the care and attention that were lavished on them, the two youngest died, to the inexpressible grief of their father, who doted on them for their own sakes, and as relics of his beloved Marguerite; but Lep recovered; and it was whilst he was lying in bed convalescent that he said to Fanchon, to whom he had become passionately attached, 'Fanchon, I want you to promise me something. Will you?'

'Yes, dear, I will if I can.'

'Oh yes, you can very well if you like.'

'Well, what is it, dear?' asked Fanchon.

'Promise that you'll be my mamma!' said Lep.

'Oh, that's nonsense!' said Fanchon, rising suddenly, for Margot was in the room. 'Lie down, and let me cover you up while I fetch your broth.'

'No I wont,' said Lep; 'I'll not lie down till you promise to be my mamma,' and he seized hold of her apron, and held her fast.

'Fie, Lep!' said Fanchon. 'Let me go!'

'You thought I was asleep that night in the wood when papa asked you to be my mamma,' said Lep; 'but I wasn't; and when we were coming home, he promised me that he would never give me any mamma but you. Oh, Fanchon, do!' he said, throwing himself into her arms; 'for now that God has taken away my brother

and sister, what shall I do without a mamma?' And yet weak and excitable from his illness, the boy burst into an uncontrollable passion of tears and sobs.

'Oh, Lep! Lep! what can I do to comfort you, darling?' said Fanchon, almost crying herself at the boy's distress and her own confusion.

'Do what he asks, my child!' said the old woman, coming to the bedside. 'I understand now the cause of poor Michel's despondency, and why you wouldn't come to live with us, Fanchon. But perhaps you don't like my son? Perhaps you couldn't be happy with him? Is that the reason you refused him?'

'No, ma'am,' said Fanchon, hiding her face amongst Lep's curly locks.

'Perhaps it was because you thought we should not like you for a daughter?' Fanchon did not answer. 'Well, Fanchon, perhaps you were right; and did you tell my son your motive for refusing him?'

'Never,' answered Fanchon.

'You're a brave, good girl,' said the mother as she left the room.

'Wont you be my mamma now, Fanchon?' said Lep, throwing his arms round her neck. 'Granny wishes it, and I wish it, and papa wishes it.'

'I don't know that,' said Fanchon.

'But I do,' said Lep; 'for when he asked me this morning if there was anything I wished for that he could give me, I asked him to give me Fanchon for my mamma; and he said he should be very glad indeed, but that Fanchon wouldn't. But you will now, wont you?'

'Perhaps!' whispered Fanchon.

'She says *perhaps*, papa: make her say *yes*!' cried Lep to Michel, who now entered the room with his father and mother.

Michel did make her say *yes*; and ere many days were passed, Fanchon became Lep's mamma, to the joy and astonishment of old Barbette, and the infinite satisfaction of all parties concerned.

THE PROCESSION-CATERPILLAR.

SOME interesting communications have recently appeared in the Belgian and German journals concerning the procession-caterpillar (*Bombyx processiona*, Linn.), an account of which may prove acceptable to our readers. Before proceeding to these, however, we may refer to what is said about this curious animal in Reaumur's valuable *Memoirs on the Natural History of Insects*. The *Bombyx processiona* is a caterpillar of medium size that infests the oak. The hairs are as long as the insect itself, and after rising perpendicularly upwards, become curved downwards. White at first, both they and the skin become reddened with age. Each family of these caterpillars forms a republic of from 600 to 800 individuals, which never quit each other, eating together, and crawling together, and remaining in close contact during their condition of chrysalides. The butterflies, however, which result from these disperse in every direction.

The caterpillars encamp on the oak, where they weave webs for their domiciles; but after changing their skins, they abandon these, and form new ones from time to time until they acquire two-thirds of their complete size, when they settle themselves in a fixed abode. The nest containing so many is necessarily large, and is found at various heights on the trunk of the oak (*Quercus robur*); but in spite of its large size, so much does it resemble the tuberosities or knots commonly seen on the tree, that unless when purposely sought for, it is very apt to be overlooked. It varies in shape, being sometimes as much as from 18 to 20 inches long by 5 or 6 broad, and rising from 2 to 4 above the level of the tree.

During their movements, the caterpillars follow a leader as implicitly as if they had chosen him to direct their march. They all move, stop, and recommence their progress exactly as he does; and from their disposition to follow his motions in regular array, Reaumur called them *processionary* or *evolutionary caterpillars*. He took

a branch of oak containing a nest home with him, and observed their movements for several days with the greatest care and interest. First a single caterpillar crawled out, others immediately following him in single file to the length of about two feet, each individual having his head close against the tail of the one preceding him. The file now became twofold; by and by these insect soldiers came three abreast; and after a while four, and then five, six, seven, and eight abreast, with the utmost regularity; the caterpillars always close to the tails of those preceding them, each rank of the line dressed as if by a drill sergeant, and all following implicitly the movements, however tortuous, of their leader. On some occasions Reaumur contrived that this leader should pass over a space apparently too small to deploy all his followers; but he nevertheless accomplished the feat by pursuing numerous tortuous lines, which soon became studded with caterpillars marking their sinuous course. Sometimes, when in search of a new portion of the oak to devour, numerous evolutions and complicated figures are formed; the head of the moving body being always angular, and the width of the rest of the line increasing with it, sometimes formed of fifteen or twenty abreast. These movements in search of food take place in the evening, and if the caterpillars are observed beyond the limits of the nest during the day-time, they are seen to be gathered together in contorted and motionless masses. When in their nests, too, they lie thus interlaced, and the chrysalides are stowed so closely, that they seem to form a cake of varying dimensions. After lying so for about a month, the butterflies all escape in the same twenty-four hours, some time in the middle of August, and rapidly disperse; the evacuated cocoons then having a strong resemblance to a wasp's nest.

Too much care cannot be taken in handling these caterpillars, as also the chrysalides and the cocoons, after the butterflies have escaped. Reaumur, acting at first incautiously in this respect, suffered some inflammation in the hands, face, and eyes in consequence; and some ladies who were observing the curious movements of the animals, without handling them at all, found their skins irritated, though in a less degree. When in his walks Reaumur merely disturbed their nests with his stick, he found some degree of the same irritation ensue; and freely covering the hands with oil was found to afford no protection to those handling the chrysalides or their husks. He attributed these irritating effects to some of the small hairs which abound on the surface of the animal. The long hairs he considered nearly innocuous; but if he removed these from the cast-off skin of the caterpillar, and then rubbed his hand with it, he experienced an irritation equal to that caused by the strongest nettles.

Professor Morren has recently read a paper on this insect at the Belgian Academy. He says that an animal so utterly destructive to so valuable a tree as the oak is fortunately rare in Belgium; but that in 1847 and 1848 great numbers were seen in certain places, furnishing opportunities of observing the frightful damages the animal is capable of causing, as well as the singular habits described by Reaumur. In 1847 it invaded a portion of the forest of Hertogenwald, situated on the confines of Prussia, and did great mischief to the oaks there, attacking especially the leaves of the larger trees. Its appearance in this forest, and the direction its ravages took, led to the belief of its being a true emigration in the direction of east to west from Germany to Belgium. In 1848 it was hoped the pest had not reappeared; but although in May its existence could be nowhere discovered, yet during a botanical excursion in the vicinity of Maastricht in July, the author and his pupils had full opportunity of observing this caterpillar migrating from tree to tree as it successively destroyed the leaves of each. He describes as frightful the spectacle of whole masses as large as a man's head, of these voracious animals, or processions of them marching on their destructive mission in troops of fifteen or twenty feet long. He was astonished at the apathy of the inhabitants, who took not the slightest step to avert the mischief, although the creatures were rapidly destroying the white oaks growing in

the hedges of the fields. The answer a peasant made when he inquired how he could think of leaving these caterpillars unmolested, especially when he knew that even the dust proceeding from their nests did injury to man and beast, seems to us rather more apposite than it did to the worthy professor. 'Kill the caterpillars!' said the man; 'why, they are sent from Heaven to destroy the oaks; the landlords plant to the detriment of their tenants' crops!'

M. Morren found Reaumur's description of their mode of progression generally correct; excepting that in the armies seen near Maestricht, which measured sometimes twenty feet in length, the series of single and double files behind the commanding general were so short, that very soon the ranks spread out to ten, twelve, fifteen, and twenty caterpillars abreast. One army might be seen ascending an oak whose leaves were already partly destroyed by another army then in the act of descending; the respective corps crossing each other without seeming to suffer any inconvenience. Indeed the instinct which impels these animals to move in unbroken files seems to render them indifferent to all external obstacles.

A globular mass of caterpillars was taken home for examination. Next day it was thrown down. After about ten minutes, one of the caterpillars deliberately crawled out, and was followed by a second and third, and so on; but on this occasion the army formed itself into two lines, each headed by a leader, one of which led his troops on towards the left, the other to the right, the point of contact being formed by the last caterpillars of each troop. The array now complete remained motionless, until the professor, having waited more than an hour without observing the slightest sign of change, dispersed them. Another curious fact observed was the power they seem to exert in deposing a leader physically incapable of doing justice to so important an office. Among the caterpillars brought home was a little, miserable, misshapen animal; and when the troop had filed off so as to bring him into line in his turn, the author contrived to place him as the head of the file. A long pause ensued. The march was arrested, as if for consultation upon the emergency. Rapid undulations shook the line, and at last it broke—a fine strong caterpillar leaving it, thus constituting himself the head of a new file, and being speedily followed by others. He who was next to the dwarf left him to follow the new leader; and even the ex-commander himself quietly fell into the line headed by his more efficient rival.

Every observer has been struck with the exactitude with which these caterpillars keep the straight line; and it has been suggested that each may take hold of the long terminal hairs of the one he follows. M. Morren, however, has examined into this point, and feels convinced that the explanation is not well-founded. These long terminal hairs, however, are directed obliquely on each side, and receive the head of the following caterpillar between them; so that it is possible this lateral contact may serve to keep the heads in a straight line.

M. Morren confirms Reaumur's statements of the irritating powers of this caterpillar. Indeed all observers agree on the point. Shepherds and swineherds, conducting their flocks to the mere vicinity of these animals, suffer from them; and so likewise does the woodman who attacks the tree they have seized upon. Nicolai, the celebrated Westphalian forest-master, says that horses brought within the sphere of their action become like mad animals; and he relates examples of the danger which has accrued to peasants sleeping near the trees, especially about the period of the metamorphosis. M. Borchhausen declares that he has known death itself result. The caterpillars taken on the 19th of June were freely handled by the author and his pupils without ill effects, and put by to form their cocoons. On the 31st, one of his children brought him a vase, in which a bombyx had passed into a perfect state; and although he closed the vase immediately, in half an hour the child's face became highly inflamed, and especially the edges of the eyelids. The portion of the author's arm, too, which had been directed towards the vase when it

was opened became similarly affected. On other members of the family opening this Pandora's box, white flakes issued, which produced the same effects. To one of these Madame Morren exposed her arm; which not only became inflamed, but the entire body afterwards was the seat of a sympathetic eruption, all ill effects, however, passing off in a few days. One of the flakes being examined microscopically, was found to be chiefly composed of a mass of hairs of various lengths and colours, most of them having a small cavity filled with some substance. M. Morren is disposed to adopt Reaumur's explanation of the irritation being produced by these minute hairs adhering to the skin, and observes that articles of furniture touched by them will long continue to possess the power of exciting irritation. It has since been announced by Professor Will that the hairs contain *prussic acid*, identical in its constitution with the matter which gives its peculiar character to the bite of the spider and the sting of the bee.

A VISIT TO THE ARCTIC SHIPS.

A VERY strong and even affecting sympathy has been manifested by the British public in the efforts made to ascertain the fate of our brave countrymen who have disappeared from human ken in the

'Thrilling regions of thick-ribbed ice,'

surrounding that mysterious North Pole, which has such powerful attractions for the imagination. It may therefore not be uninteresting to those who 'dwell at home at ease' to hear something of the preparations and precautions used on board the ships now recently departed for the purpose of seeking their lost sisters. A few days ago we visited the *Resolute*—the 'head lady,' as Costard would say, of the expedition. The external appearance of the vessel struck us as well adapted to harmonise with the scenery amid which she is to be a prominent object. She is painted black, with a narrow red stripe running round the upper portion of the side; and this colouring, and the absence of ports (or *windows*, as landmen would call them), give her a solemn, determined appearance, suitable to a ship going on no holiday task, but one of solemn earnest. Her figure-head is a snowy polar bear.

We were very courteously received on board by the officers, one of whom, Lieutenant Brown, had been in the *Enterprise*, and has lately favoured the public with a Panorama of the Arctic Regions, and an exquisite volume of engravings of the same scenes. The vessel is a *double ship*—that is to say, she is lined with extra beams of ash and oak, which add at once to her strength and warmth; the bow, which of course will come into the fiercest contact with the ice, is eight feet six inches thick, and sheathed outside this mass of timber with iron. The officers' cabins are lighted by skylights only; the captain's of course occupies the stern of the ship: it is warmed by pipes of hot air running round it, and by a copper stove and funnel, and will be constantly kept up to a temperature of sixty degrees; a narrow passage and the companion-ladder separate it from the gun-room, or apartment appropriated to the other officers, round which are some of their berths or bedrooms. These, though very small, are extremely neat and comfortable; the hot-air pipe, covered only by a sort of 'letting-in' work of iron, with a very pretty open tracery on it, runs along the side of the ship, and is consequently in the bed-place itself. We proceeded from these cabins to examine the stove from whence the air-pipes issue. It is in the hold, nearly in the middle of the vessel, and is of considerable size; there is a funnel for the escape of the smoke, and the air is warmed by coming in

contact with the heated metal, two huge tubes of which proceed from the stove; and on reaching the main-deck, are divided on each side into two smaller branches, which run round the officers' cabins, and towards the fore-castle, thus completely warming the habitable deck. Outside the cabins is an apparatus for washing and cooking, all in one. It resembles in shape an old-fashioned plate-warmer, being, however, very much higher. There is a huge grate underneath: the upper part has ranges of shelves for baking; it slips off, and the top of the oven reversed fixes into its place, and becomes a copper for washing or boiling. Close to it is a Downton's pump for pumping the ship, and near the fore-castle another for pumping up either fresh or salt water. These pumps are on the hydraulic principle. They look like huge copper or brass vases; and the tubes or funnels running up from them on deck, in order to prevent the water within from freezing, are covered closely and carefully with the coarse sort of flannel of which our snow-boots are made. Two stand together, divided by a brass plate of a circular form, with large, round, flat pieces surrounding it. There is a movable centre-piece of the same metal, which, fixed on one or other of the rounds, sends up either fresh or salt water, as you choose, by its pressure; or—as in the case of the pump further aft—pumps out the ship; thus saving the sailors the terrible and depressing labour they used to have when such exertion became necessary in days of yore.

Near the fore-castle is a machine for dissolving ice or snow for use. A sort of iron shoot receives the snow on deck, when shovelled in by the men, and it descends through this passage into a huge iron reservoir, beneath which is a furnace. Here it is melted, and runs through a pipe into the tubs or buckets placed to receive it. Mr Brown told us that ice would be first melted in it, as it would be some time ere they saw snow. We were then shown the ice-saws, by means of which a passage of miles has been cut through the ice. They are of huge dimensions, with tremendous teeth. The method of using them is by fixing a triangle, to the apex of which a block is hung; a strong rope runs through it, to one end of which the handle of the saw is attached; the other end has a number of smaller ropes proceeding from it, by means of which the sailors work the saw through the solid ice, and are thus enabled to open (as we have said) a passage of some length. Such are some of the mechanical facilities that science has afforded for encountering the terrible north. Indeed we came to the conclusion that a residence on board, in cabins kept up to such a temperature, could not be very uncomfortable; but we were reminded of the necessity of going on deck, and into the air, and this of course led to an explanation of the means used to prevent the effects to be apprehended from such a sudden change of atmosphere. Her Majesty provides the members of the expedition with boots which reach higher than the knee, of the very thickest flannel, with soles of cork two inches thick; the inner dress is of flannel, next to that chamois leather, which, preventing evaporation, retains the heat; then, if they choose, another garment lined with fur, or a greatcoat lined with sables, one of which we saw: a sort of helmet is to be worn on the head, to which is attached a mask of knitted wool, wadded and lined with silk, and doubly thick over the nose, leaving only an aperture for the eyes. These masks are of different colours; and the whole attire, especially when the hands disappear in the huge fur gauntlets which complete it, is almost ludicrous.

The stores laid in are necessarily abundant; a transport follows with them, to be transferred to the vessels when they reach a certain latitude. The officers' private stores are, however, on board the separate ships to which they belong. Amongst them were some very large tin cases of preserved potatoes, looking like a quantity of rough coarse powder or meal, but which, when mixed with boiling water, make in a few minutes an excellent

dish of mashed potatoes. In answer to our inquiries as to whether there was any difficulty in getting the ships manned, we learned that the sailors were very anxious to enter, and that three or four times the number of the crew might have been obtained, but that great care was necessary in the selection of the men with regard to health and strength, an *old scar* even rendering them unfit for the climate they were to endure. The officers appeared in great spirits, and declared that if their lost comrades are still living, it is impossible to miss finding them, the search is so well planned. Heaven grant it! and that their own voyage may be achieved in safety. They have a brave and experienced commander, a most humane and courteous gentleman, who will doubtless render their life on ship-board as pleasant as one of great fatigue and privation can be, for they have to anticipate a winter of solemn gloom, and many an unforeseen peril, ere they look upon merry England again. They bear with them the best wishes of the public, and as it is not a mere mania for (practically) useless discovery which sends them forth, we do not deem it quite as much a matter of regret as usual that England should peril so many of her best and bravest on the enterprise.

We left the Arctic ships highly gratified by our visit, everything but the balloons being then on board. Government has done much to alleviate their discomforts and dangers; but we trust that *one* source of comfort has not been overlooked—that is, a good supply of entertaining and instructive books for all. Not a common ship's library, but one meet to beguile the tedium of a Polar winter, and render it a period of mental improvement to many. There are now numerous publications admirably suited for such a purpose, and the generosity of the public could not be better exercised than in bestowing them on these or other vessels destined for the Arctic seas.

OCCASIONAL NOTES.

PIANOFORTES FOR THE MILLION.

A REGRET was some time ago expressed in the *Journal*,* that since the pianoforte is now the reigning instrument of the civilised world, it should, from its expensiveness, be confined to the comparatively affluent classes. It was suggested that, as much of the costliness of the instrument was caused by fineness of materials not essential to the musical result, it might be possible, by using plainer materials of that kind, to make a considerable reduction of price without any inferiority in essentials. On this hint the respectable firm of Collard and Collard of London have acted, and we have now, by their favour, seen an example of certainly a much more popular class of instruments than what has previously existed. The piano submitted to us is of the cottage size and form: its key-board presents six and a-half octaves. The strings are arranged on a frame strengthened by metal. It is such an instrument as, when of finer external materials, is usually offered by the maker at L.56. The price of this is L.30, being a reduction of nearly one half. The only apparent difference of the instrument from others is in the paleness of the wood forming the case, this being of the common pine instead of mahogany. Yet, far from being in the least inelegant, it has rather a pretty effect, the exterior being highly polished, and having much the appearance of satin wood. As to essentials, the instrument is excellent; its tone is clear, metallic, and rich, and this from end to end of the key-board, while two pedals serve to give the usual modifications to the effect.

While expressing to Messrs Collard and Collard our gratification in finding them so far successful in cheapening the pianoforte, we must take leave to urge further efforts in the same direction, for L.30 is still a price

* No. 306, published on the 10th of November 1849.

which places the instrument beyond the reach of many persons of taste in the middle ranks of life. Let this powerful firm bethink itself of further reductions, even though these should extend to the matters of compass and pedals, so as to offer serviceable pianofortes at, say £20. This would be a triumph indeed, and we shall hope to see it accomplished.

THE CENTRAL LAKE IN SOUTH AFRICA.

This sheet of water, the discovery of which, in 1849, by three British travellers has already been made familiar to the public, is supposed to lie about latitude 20° 19' south, and longitude 24° east. A writer in the 'Graham's Town Journal' of February 9, 1850, expresses his firm belief that the discharge of its waters is by the well-known river Zambezi, which falls into the Mozambique Channel. He also points out that there is a continual chain of mountains or table-land from this point far to the north, and he recommends that we should now endeavour to push commerce into Africa by that overland course, instead of spending efforts vainly on the coast, where unhealthy atmosphere, the slave trade, and the semi-Portuguese and Arabic character of the inhabitants, compose a formidable opposition. 'In this inland route,' he says, 'there are no fevers to contend with, and the fears and prejudices of the natives, by kindness, gentleness, and gifts, will soon be overcome. With such a road open, what should hinder commerce and civilisation advancing with rapid strides? The natives, instead of being obliged to take their produce and collections from the interior to the sea, at the risk of being plundered and kidnapped for slaves, would find, without any fear at all, a far better market in the interior itself.' The writer concludes by recommending the formation of a Pioneering Society, and pointing out three sundry routes to the lake.

It strikes us that this is a rational plan of procedure for Europeans seeking access to Africa. It is in the high inland grounds that a climate will be found which a European constitution can bear. Push forward lines of civilisation into the centre, and the depraved communities on the coast must languish like limbs which have been cut off by ligatures from communicating with the centre of organisation.

NOVELTY IN NEEDLEWORK.

We have seen some specimens of what appears to us to be a new application of the art of pictorial embroidery, and of a kind which gives more artistical scope than the usual laborious essays of the needle. The specimens are chiefly landscape; and unless the spectator stands very close to the picture, or the light shines strongly upon it, he can have no suspicion that it is anything else than an oil-painting. The effect is not produced by what would be called *stippling* in painting, but by bold splashes, so to speak, of the coloured wool, thrown down horizontally, vertically, or diagonally, according to the rules of drawing. The views are obviously taken from nature; and one now before us of Fast Castle, with the cliffs half buried in gloom, and the agitated waters, touched here and there by the red sunset, exhibits a feeling of art not very common even among the wielders of the pencil.

These productions, though worthy of attention from their intrinsic merit, have likewise an interest attached to them from the circumstances under which they are brought before the public. The artist, Mrs Maclauchlan, a young married lady, is the daughter of M'Kenzie of Gruinord, the last male representative of the earls of Seaforth and barons of Fortrose. She has now been thrown, by unmerited misfortunes, upon her own resources, and cultivates, as a means of support for herself and her mother, the elegant accomplishments she studied under very different prospects. Her works have been purchased by various members of the nobility, and there is one of them, we believe, in the possession of her Majesty; but as, owing to the material used, they are not admissible into the pictorial exhibitions, it is requi-

site that other steps should be taken to draw towards them the attention of the public. We shall be much gratified if this brief notice should assist in any degree in obtaining for them the desired publicity.*

THE UNIVERSITY OF CAIRO.

Of the outside of Egypt little or nothing remains undescribed by the tourist; and if it be not an exhausted country, it is only because the variety of moulds into which the Almighty has cast the minds of writers is inexhaustible, and not because there are temples unmeasured and unlimned, or natural phenomena unobserved or unaccounted for. But the interior life of Egypt is still a wide and interesting field for research, which has been only glanced at by the thousand-and-one fashionable tourists who have published on that country, the unique works of the Lane family being the exceptions that prove the rule.

The obstacles to these studies are the great difficulties of the Arabic language, and still more the fanaticism of the people on religious subjects. In China, where political motives restrict the locomotion of the traveller, the pure morality of a Confucius, and the shining humility of a Mencius, have produced a considerable tolerance—a tolerance which would have been extended to Christianity if Jesuitism had not made it a political engine, and compelled the government to deal alike with matters of fact and matters of faith. No idea of desecration interferes with the free entrance of a European into their temples, or with the perusal of their sacred books, or free inquiry into their doctrines. But in the Ottoman empire, the European is in other matters not only not obstructed, but forwarded and assisted. Acts of arrogance and even outrage on his part often pass with impunity; but the people abhor the sight of a Frank costume in their mosques; and in the *azhar*, as the university of Cairo is called, it is absolutely prohibited, except in the rare and extraordinary case of the visit of a member of a house reigning in Europe. The Chinese hates the foreigner for his barbarous nation, and not for his difference of faith; while the Egyptian detests the difference of faith rather than the difference of nation, and would make the Koran a sealed book to unbelievers.

To make a semblance of joining in the divine service of Moslems for literary purposes is what no right-thinking man would descend to now-a-days, however it may have been considered in the time of Burkhart. On the other hand, to pay a literary and historical visit to Cairo, and leave out the university of the *azhar*, would be to enact the tragedy of 'Hamlet' with the part of the prince omitted. I therefore adopted a middle course, such as that recommended by Sir Gardner Wilkinson in his 'Guide to Modern Egypt,' which was, to wear the costume for a period; so that although I was known as an Englishman, I entered all the mosques with perfect freedom during the intervals between divine service, and visited the *azhar* repeatedly, there being nothing in my appearance to attract especial observation or to shock Moslem prejudices. In visiting the pasha, I appeared in no other costume than that of plain John Bull.

It was on one of the clear beautiful days of November in Cairo, when the heat of summer had passed, when the inundation had begun to decline, and the delicious season of the winter had just commenced, that I accompanied my cicerone to the *azhar*, which is situated in the upper part of Cairo—that is to say, that part of the city which is most remote from the Nile, and close under the mountain-chain running parallel with the river. Instead of being situated, as most universities are in Europe, in some open square, you never see it until you find yourself at the so-called Barbers' Gate; an entrance elaborately sculptured in the Saracenic manner, but more remarkable for its excess of ornament than for grandeur and simplicity of design, deriving its name from the circumstance of several of this craft being generally seated there on mats in the open air with the implements of their trade ready for a customer. The streets in the vicinity of

* Mrs Maclauchlan resides at 4 Horatio Place, Gourcock.

the azhar have nothing to make them remarked from other parts of Cairo, being narrow, dark, and unpaved—an inconvenience not felt in a country where there is from three to five days' rain in the year; while from the want of noise of wheels or stones, and the shops being all opened to the street, without a wall on this side, and every few paces being covered over from house-top to house-top to exclude the sun, one has a feeling of walking rather in the labyrinthine passages of an enormous house than in the streets of a capital.

Within the university we find the mosque proper; a wide and extensive hall, with the roof supported by a great many columns, evidently originally from Greco-Roman edifices, or Christian basilica, before the Moslem conquest in the seventh century. The destruction of a Christian church never stood in the way of the architects of the earlier mosques of Cairo; and the invention of the pointed arch in the ninth century, long before it was ever seen or heard of in Europe, arose from the ingenuity of a Christian architect, who, to save his church from being despoiled of its columns to build the mosque of Touloun, promised to construct an arcade without the necessity of cylindrical columns. The discussion on the origin of the pointed arch has been for a century past a hot one among archaeologists, but need never have been so if Macrizi had been accessible in a translation to Egyptian travellers.

There was rather a deficiency of light in this mosque compared with the others that are open courts; but there was still enough to read and write by; and the floor was completely covered with clean new mats. It was not the hour of prayer, and the place appeared to be a sort of general lounge, where were seen the Ulema, with their high white turbans of a peculiar fold; the *Megawereen*, or students and fellows, of various dresses and complexions, from the different parts of the Moslem world; and blind men, groping from pillar to pillar with the ease of familiar spirits. Mr Lane has given several anecdotes of the pride, insolence, and fanaticism of these poor blind men; but one I received from my informant was quite the other way. Once a blind man entered the azhar, wearing a blue Christian turban. He was consequently beaten, and told to go out, on which he cried out—'I am Sheik Mohammed; why do you beat a Moslem in the temple of God?' 'It is not true,' said they; 'else why do you wear the dress of a Christian?' And on explanation, it was found out that a hoax had been played upon him by a man who had offered and pretended to sell him the green turban of a Sherceef, giving him, instead, the dark-blue one of a Christian.

We now passed through a door into the court with the other porticos or cloisters called *Riwack* (plural *Rewa-weck*), and in these saw the nations, not intermingled, but each in its separate compartment, seated on the ground cross-legged, receiving instruction in the beautiful but time-killing mental gymnastics of Arabic grammar and prosody, logic and rhetoric, law and dogmatic theology, and in the smattering of pre-Copernican astronomy and mathematical science that is requisite for an almanac-maker or time-keeper of a mosque, with a view to precision in the hours appointed for prayer. The *Riwack Es-Sham*, or Cloister of Syria, had in 1845-46 altogether nearly three hundred pupils; but those I saw could not be a quarter of that number, and were easily distinguished, having fair complexions, clean turbans, and being altogether the best dressed and most respectable group in the university. A complete contrast to them are the *Mogrebins*, who drove me to think of politics rather than of literature. Many of them from Morocco were dressed in *haiks*, or garments of a drab colour of the coarsest texture, and were of a much darker colour than Syrians, with coarser skins, being altogether a savage, unpolished-looking race; although many of them, particularly the Tunisians, dress like Arab townsmen, in a costume resembling that of Egypt. Looking at the two races, one sees at once that the prolonged resistance which the Algerines have offered to the French is that of a race far more savage and warlike, far more energetic and fanatical, and, let us add, far less corrupted, than the Moslems of Egypt

and Syria. One of the cloisters contains several fellow-subjects or protégés of our most gracious Majesty the Queen, who are Moslems from Western India, frequenting a *Riwack* called *Goawey*, from Goa; but as I have always found Indian Moslems very shy in the Ottoman empire, I did not claim any political relation with them.

While foreign Moslem countries have for the most part only a single *Riwack*, each division of Egypt has its own, several of which have still some income allowed in the shape of daily bread; for instance, that of the *Sharkawy*, or country to the east of the eastern mouth of the Nile, which has two hundred loaves of bread a day. The cloisters of the other districts of Egypt have peculiar names unknown to maps. That of the country around Alexandria is called *Liptigaweey*, and that of the Delta, *Tabarseey*. The cloister of the people of Saïd, with its fountain reading-room, is distinguished by the dark complexion of its inmates; but darkest of all is the cloister of the *Dac-roory*, who are perfectly black; a cloister that was instituted by Kaid Bey, a sultan who lived towards the close of the fifteenth century, and which turns out ebony Ulema, cadis, and muftis for the countries beyond the Cataracts. Moslems from Persia and Central Asia are common; but if we cast our eyes to the Celestial Empire, where there are nearly twenty thousand mosques, a solitary Alim from that vast and distant region was the only one who attended the azhar in the winter of 1845-46.

As to the general doctrines and discipline of Islamism as taught in the azhar, I refer the reader to the well-known works of Reland and Sale; and as regards custom and law, he will find the expositions of the four great Moslem doctors, Hanife, Shafei, Malek, and Hambale, geographically mapped in Mr Lane's 'Modern Egyptians.' All Turkey Proper follows the first; most of Egypt and Syria the second; Morocco and Western Africa the third; and Mr Lane assigns to the fourth the Wahabees of Arabia, to whom I would suggest, as an addition, the inhabitants of the important city of Bagdad and Nablouse in Syria, the latter the Samaritan Sicheim of Scripture. A detailed history of the fortunes and misfortunes of the azhar—of the rise, decline, and fall of learning in Egypt, from the foundation of the university in the tenth century to the present period—if written with the erudition of a Hammer Purgstall, a Lane, or a Quatremare, would be one of the most interesting works conceivable; but in a sketch of this sort, a brief and rapid glance is all that can be given.

The azhar is the oldest ecclesiastical edifice of Cairo Proper—that is to say, of the Cairo built and named by Moezz, the first of the Fatimite caliphs; for when Egypt was conquered by Amru, in the time of the Caliph Omar, the city was not in existence. Cairo was built by Moezz with strong walls, and the streets called after his mercenaries, among whom were Greeks and Sicilian Saracens. The mosque was finished in two years, and was, according to the inscription on the right of the sanctuary, 'built by the command of Abdallah, vicegerent of God, Abou Temin Ma'ad el Imam el Moezz Ledinallah, the prince of the faithful, on whom and on whose fathers and legitimate children be the blessing of God, and by the hands of his servant Gohar, the secretary, the Sicilian, in the year 369.' There is a talisman to prevent the sparrows and turtle-doves from building their nests there—the talisman being the figures of birds carved in stone. Ten years after its foundation, the mosque was endowed as a seminary, the *fakihs*, or tutors and lecturers, being thirty-five in number, and besides a small salary, each being allowed a new dress and a mule at the festival of Bairam; and thus was the azhar the principal mosque and seminary in the first years of the Fatimite dynasty.

The two principal figures in this dynasty were men as opposite to each other as it was possible to conceive, but both professing to protect learning. The former, Hakem, is to this day, according to the Druse religion, the incarnation of the Deity; for, not content with being acknowledged caliph in Egypt, Syria, and the Barbary states, he wished himself to be considered a god. Instead of being an orthodox Moslem, he had a great deal of communication with the emissaries of the Ismaelites and Assass-

sins, the people of the Old Man of the Mountain; and at last, owing to his cruelties and eccentricities, was murdered at the instigation of his own sister. He was thus morally at war with the doctors of divinity in the azhar, although he repaired and further endowed it, as appears by the deed of settlement given by Macrizi; a curious specimen of Cairo conveyancing in the tenth century after Christ.

Hakem set up an institution of his own, called the Dar el Hekimet, or College of Science, with a copious library, and pen, ink, and paper for those who wished to consult it; his object being to introduce the philosophy of the Carmates, who allegorised the precepts of Islamism, and by their secret societies wished to establish a universal dominion in the East on the ruins of the Caliphate of Bagdad. Consequently Hakem is regarded to this day by every true Moslem as having been an impious impostor.

A very different person was one of his successors, Mostanser, who may be regarded as the Mamoun, or Harouner-Reshid, of the Fatimite dynasty. He was a mild and pious prince, who reigned in the eleventh century. His private library contained 120,000 volumes; and although he completed the mosque of Hakem with great magnificence, he did all in his power to encourage learning and learned men, and the azhar was well frequented. But the dynasty was brought to a close in the year 567 of the Flight, or 1171 of Christ, by the splendid military talents of Saladin; and henceforth the litany which used to be read for the Fatimites was restored to the caliphs of Bagdad. But Saladin settled that it should be read in the mosque of Hakem, on account of the size of the building; and for a hundred years no *khotbet*, or litany, was recited in the azhar, until it was restored by Sultan Bibars. But in the great earthquake of 702 of the Flight, which ruined so many mosques, the original azhar of Moezz was thrown down; and the great emirs who spent their lives in combating the Crusaders arranged to rebuild a mosque each, when the Emir Silar rebuilt the azhar. No Tasso has sung the valour and generosity of the heroes of Islamism; but whoever reads the contemporary accounts of both sides of the question debated in these days, must come to the conclusion, that in piety, in valour, and in generosity, a Saladin, a Bibars, and a Bayseri, were in no way inferior to a Louis or a Godfrey of Boulogne.

All the dynasties of caliphs were Arabic; but that singular series of temporal dynasties which, on the fall of the Fatimites, began with Saladin, and ended with the Ottoman conquest in 1517, was at first Kurdish, then Turkish, and last of all Circassian. But Arabic being the language of Islamism, remained also that of science, and even of the most considerable departments of government; and Saladin, Bibars, Sultan Hassan, and Kauso el Ghory, the last and most learned of the Mameluke sultans, all cultivated Arabic literature.

The funds for the azhar were ample, for we find that in the year 818 of the Flight, upwards of 750 Ulema pupils and fellows were maintained out of the income of the college. The Megawereen, or fellows, lived in a sort of monastic state, Sultan Barkouk having ordained the law, that what they possessed should be in common; hence a state of idleness and disorder inseparable from Communism. A species of Moslem John Knox arose in the midst of this monkish system, in the person of the Emir Sodula, who turned them out by violence with their boxes and trunks, throwing them on the world in the most miserable condition. Some went back, and even blows were resorted to to drive them out; but this emir's conduct appeared to be that of a destroyer of learning rather than a reformer of learned men, and he was consequently seized by the sultan, and confined until he died.

During the three centuries of the Ottoman possession of Egypt, the number of pupils of the azhar may not have fallen off, but the literary spirit of Cairo has much declined from what it was when it gave birth to such vast historic labours as those of a Macrizi in the fifteenth century of Christ; and the reforms of Mohammed Ali have altogether altered the position in which the Ulema and pupils of the azhar formerly stood. It has ceased to

be an asylum for murderers, which it previously was. Another peculiarity was, that that formidable personage, the inspector of weights and measures, had no government over the quarter of the azhar, as they had a separate inspector of their own, whom they called by the curious name of Gyndy el Mudback, or Trooper of the Kitchen: one being in the house of the sheikh of the azhar, the other in the house of the sheikh of the rite of Malek. The government of the Shereefs and Ulema by separate magistrates is also abolished; and if these rob or steal, they are under the control of the ordinary police; although in minor assaults and batteries, which are very frequent among those persons, they are handed over to the sheikh of the azhar, who adjudges and punishes them through the trooper of the kitchen.

The seizure of the mosque lands by the Egyptian government, the establishment of medical and polytechnic schools, and last of all, the institution of a species of gymnasium at Paris, where 150 young Egyptians receive Frank education, have, so to speak, completely altered the polarity of education in Egypt. Polytechnic schools have risen on the decline of the Moslem Sorbonne. The principle of the old education is religious even to fanaticism; that of the new latitudinarian, and entirely subservient to military purposes; consequently medicine and mathematics, drawing and European languages, take the precedence of other branches of instruction. I have seen the Ulema at an opera of Donizetti in the castle of Cairo, and have heard the mufti of Cairo in the house of the Sheikh el Bekri, on the evening of the Festival of the Prophet, promise to affix his approbation to the novelty of a printed edition of the Koran: but these are the exceptions, and the Ulema of the azhar rather shut their eyes on such innovations than accept them cordially; and I regard a reaction towards the old system to be, however undesirable, yet highly probable.

LAST DAYS OF COPERNICUS.

It was a still, clear night in the month of May 1543: the stars shone brightly in the heavens, and all the world slept in the little town of Wernica, a canonry of Prussian Poland—all save one man, who watched alone in a solitary chamber, at the summit of a lofty tower. The only furniture of this apartment consisted of a table, a few books, and an iron lamp. Its occupant was an old man of about seventy, bowed down by years and toil, and his brow furrowed by anxious thought; but in his eye kindled the fire of genius, and his noble countenance was expressive of gentle kindness, and of a calm, contemplative disposition. His white hair, parted on his forehead, fell in waving locks upon his shoulders. He wore the ecclesiastical costume of the age and country in which he lived: the long straight robe, with a fur collar and double sleeves, which were also lined with fur as far as the elbow.

This old man was the great astronomer Nicholas Copernicus, doctor of philosophy, divinity, and medicine; titular canon of Wernica; and honorary professor of Bologna, Rome, &c. Copernicus had just completed his great work 'On the Revolutions of the Heavenly Bodies.' In the midst of poverty, ridicule, and persecution, without any other support than that of his own modest genius, or any instrument save a triangle of wood, he had unveiled heaven to earth, and was now approaching the term of his career just as he had established on a firm basis those discoveries which were destined to change the whole face of astronomical science. On that very day the canon of Wernica had received the last proof-sheets of his book, which his disciple Rheticus was getting printed at Nuremberg; and, before sending back these final proofs, he wished to verify for the last time the results of his discoveries. Heaven seemed to have sent him a night expressly fitted for his purpose, and he passed the whole of it in his observatory. When the astronomer saw the stars beginning to pale in the eastern sky, he took the triangular instrument which he had constructed with his own hands out of three

pieces* of wood, and directed it successively towards the four cardinal points of the horizon. No shadow of a doubt remained, and, overpowered by the conviction that he had *indeed* destroyed an error of five thousand years' duration, and was about to reveal to the world an imperishable truth, Copernicus knelt in the presence of that glorious volume whose starry characters he had first learned to decipher, and folding his attenuated hands across his bosom, thanked his Creator for having opened his eyes to understand and read aright these His glorious works. He then returned to the table, and seizing a pen, he wrote on the title-page of his book—'Behold the work of the greatest and the most perfect Artisan: the work of God himself.' And now, the first excitement having passed away, he proceeded, with a collected mind, to write the dedication of his book.

'To the Most Holy Father, Pope Paul III.: I dedicate my work to your holiness, in order that all the world, whether learned or ignorant, may see that I do not seek to shun examination and the judgment of my superiors. Your authority, and your love for science in general, and for mathematics in particular, will serve to shield me against wicked and malicious slanderers, notwithstanding the proverb which says that there is no remedy against the wounds inflicted by the tongue of calumny, &c.

NICHOLAS COPERNICUS—*Of Thorn.*'

Soon the first dawn of day caused the lamp of the astronomer to burn more dimly; he leant his forehead upon the table, and, overcome with fatigue, sank into a peaceful slumber. After sixty years of labour, he in truth needed repose. But his present repose, at all events, was not destined to be of long duration: it was abridged by the entrance of an aged servant, who, with slow and heavy step, ascended the tower stairs.

'Master,' said he to the canon as he gently touched him upon the shoulder, 'the messenger who arrived yesterday from Rheticus is ready to set out on his return, and is only waiting for your proof-sheets and letters.'

The astronomer rose, made up the packet, which he duly sealed, and then sank back upon his chair, as if wearied by the effort.

'But that is not all,' continued the servant; 'there are ten poor sick people in the house waiting for you; and besides, you are wanted at Frauenberg, to look after the water-machine, which has stopped working; and also to see the three workmen who have broken their legs in trying to set it going again.'

'Poor creatures!' exclaimed Copernicus. 'Let my horse be saddled directly.' And with a resolute effort shaking off the sleep which weighed down his eyelids, the good man hastily descended the stairs of the tower.

The house of Copernicus was, in outward appearance, one of the most unpretending in Wernica: it was composed of a laboratory, in which he prepared medicine for the poor; a little studio, in which this man of genius, skilled in art as well as in science, painted his own likeness or those of his friends, or traced his recollections of Rome and of Bologna; and lastly, of a small parlour on the ground-floor, which was ever open to all who came to him for remedies, for money, or for food. Over the door an oval aperture had been cut, through which a ray of the mid-day sun daily penetrated, and resting upon a certain point in the adjoining room, marked the hour of noon. This was the astronomical gnomon of Copernicus; and the only ornament the room contained were some verses written by his own hand, and pasted up over the chimney-piece.

It was in this parlour that the good canon found the ten invalids who had come to claim his assistance; he dressed the wounds of some, administered remedies to

others, and on all he bestowed alms and words of kindness and consolation. Having completed his labours, he hastily swallowed a draught of milk, and was about to set out for Frauenberg, when a horseman, galloping up to the door, handed him a letter. He trembled as he recognised the handwriting of his friend Gysius, bishop of Culm. 'May God have pity on us,' wrote this latter, 'and avert the blow which now threatens thee! Thy enemies and thy rivals combined—those who accuse thee of folly, and those who treat thee as a heretic—have been so successful in exciting against thee the minds of the people of Nuremberg, that men curse thy name in the streets; the priests excommunicate thee from their pulpits; and the university, hearing that thy book was about to appear, has declared its intention to break the printing presses of the publisher, and to destroy the work to which thy life has been devoted. Come and lay the storm; but come quickly, or thou wilt be too late.'

Before Copernicus had finished the perusal of this letter, he fell back voiceless and powerless into the arms of his faithful servant, and it was some moments before he rallied. When he again looked up, the horseman, who had been charged to escort him back, asked him how soon he would wish to set out.

'I must set out directly,' replied the old man in a resigned tone; 'but not for Nuremberg or for Culm; the suffering workmen at Frauenberg are expecting me; they may perhaps die if I do not go to their assistance. My enemies may perhaps destroy my work—they cannot stop the stars in their courses!'

An hour later, Copernicus was at Frauenberg. The machine which he had bestowed upon this town, which was built on the summit of a hill, conveyed thither the waters of the river Bouda, situated at the distance of half a league in the valley below. The inhabitants, instead of suffering, like their fathers, from continued drought, had now only to turn a valve, and the plenteous stream flowed into their houses in rich abundance.

This machine had got out of order the preceding day, and the accident had happened very inopportunistically, because this was the festival of the patron saint of Frauenberg. But at the first glance the canon saw where the evil lay, and in a few hours the water again flowed freely into the town. His first cares, we need not say, had been directed to the unhappy men who had received injuries whilst working in the sluices: he set their fractured limbs, and bound them up with his own hands; then commending them to the care of an attendant, he promised to return and visit them on the morrow. But a blow was about to descend upon himself which was destined to crush him to the dust.

As he crossed the square, whilst passing through the town on his return home, he perceived amidst the crowd a company of strolling players acting upon a temporary stage. The theatre represented an astronomical observatory, filled with all sorts of ridiculous instruments—in the midst stood an old man, whose dress and bearing were in exact imitation of those of Copernicus. The resemblance was so striking, that he directly recognised himself, and paused, stupified with astonishment. Behind the merry-Andrew, whose business it was thus to hold up the great man to public derision there stood a personage whose horns and cloven foot designated him as a representation of Satan, and who caused the pseudo Copernicus to act and speak, as though he had been an automaton, by means of two strings fastened to his ears—which were no other than asses' ears, of considerable dimensions. The parody was composed of several scenes. In the first, the astronomer gave himself to Satan, burnt a copy of the Bible, and trampled a crucifix under foot: in the second, he explained his system, by juggling with apples in guise of planets, whilst his head was transformed into a likeness of the sun by means of torches of resin: in the third, he became a charlatan, a vender of pomatum and quack medicines—he spoke dog-Latin to the passers-by; sold them water, which he had drawn from his own well, at an exorbitant price; and became intoxicated himself with excellent wine, in such copious draughts of which did he indulge, that he finally disappeared under

* Tycho Brahe has preserved to us a drawing of this instrument, which was the means of accomplishing such wonderful discoveries, and which was sent to him after the death of Copernicus by John Ilanovrius, bishop of Wernica. It is difficult for us to conceive how a triangle so rude in its formation, and so irregular in its movements, can have supplied, in the hands of this great man, the place of those infallible telescopes which have since served to confirm his discoveries.

the table: in the fourth and closing act he was again dragged forth to view as one accursed of God and man; and the devil, dragging him down to the infernal regions amidst a cloud of sulphurous smoke, declared his intention of punishing him for having caused the earth to turn on its axis, by condemning him to remain with his head downwards throughout eternity.

When Copernicus thus beheld the treasured discoveries of his whole life held up to the derision of an ignorant multitude, his enlightened faith branded as impiety, and his self-denying benevolence ridiculed as the quackery of a charlatan, his noble spirit was at first utterly overwhelmed, and the most fearful doubts of himself, of mankind, and even of Providence itself, rushed upon his mind. At first he hoped that the Frauenbergians, the children of his adoption, to whose comfort and happiness he had devoted himself for fifty years, would cut short the disgraceful scene. But alas! he saw his defamers welcomed with applause by those on whom he had conferred so many benefits. The trial was too much for his failing strength; and worn out by the emotion and fatigue of the preceding night, and by the labours of the morning, he sunk exhausted to the ground. Then, for the first time, did the ungrateful multitude recognise their benefactor: the name of Copernicus flew from lip to lip—they heard that he had come that very morning to the town in order to relieve their distress—in a moment the current of popular feeling was turned, their ingratitude was quickly changed to remorse—the crowd dispersed the actors, and crowded anxiously round the astronomer. He had only strength left to call for a litter, and was conveyed back to Wernica in a dying state. He lingered, however, still for five days—days of trial and anxiety—during which the lamp of genius and of faith still shed its halo around the dying man. On the day succeeding his visit to Frauenberg, a letter from Rheticus confirmed the sinister predictions of the bishop of Culm: thrice had the students of the university made an attempt to invade the printing-office whence the truth was about to issue forth. 'Even this very morning,' wrote his friend, 'a set of madmen tried to set fire to it. I have assembled all our friends within the building, and we never quit our posts either day or night, guarding the entrance, and keeping watch over the workmen—the printers perform their work with one hand, whilst they hold a pistol in the other. If we can stand our ground for two days, thy book is saved; for let only ten copies be struck off, and nothing will any longer be able to destroy it. . . . But if either to-day or to-morrow our enemies should succeed in gaining the upper hand' . . . Rheticus left the sentence unfinished, but Copernicus supplied the want—he knew how much depended upon this moment. On the third day another messenger made his appearance, and he, too, was the bearer of evil tidings: 'A compositor, gained over by our enemies, has delivered into their hands the manuscript of the book, and it has been burned in the public square. Happily the impression was complete, and we are now putting it into press. . . . But a popular tumult might yet ruin all!'

Such was the state of suspense in which the great Copernicus passed the closing days of his existence! Life was ebbing fast, and the torpor of death had already begun to steal over his faculties, when a horseman galloped up to the door in breathless haste, and springing from his horse, hastened into the house of the dying astronomer. A volume, whose leaves were still damp, was treasured in his bosom: it was the *chef-d'œuvre* of Copernicus: this messenger was the bode of victory.

The spark of life, so nearly extinguished, seemed to be rekindled for a moment in the breast of the dying man: he raised himself in his bed, grasped the book with his feeble hand, and glanced at its contents with his dim, expiring eye. A smile lighted up his features; the book fell from his grasp; and clasping his hands together, he exclaimed, 'Lord, let thy servant now depart in peace!' Hardly had he uttered these words, before his spirit fled from earth to return to the God who gave it. It was the morning of the 23d May—day had not yet dawned—heaven was still lighted up with stars—the

earth was fragrant with flowers—all nature seemed to sympathise with the great revealer of her laws—and soon the sun, rising above the horizon, shed his earliest and purest ray upon the still, cold brow of the departed, and seemed in his turn to say, 'The king of creation gives thee the kiss of peace, for thou hast been the first to replace him on his throne.'

Persecution followed Copernicus even in the grave. The court of Rome replied to his dedication by condemning his book; but the book was the instrument of its own revenge by enlightening the court of Rome herself, which at last recognised, although too late, the faith and the genius of the astronomer of Wernica. Prussia, with the ingratitude of a conqueror, has converted the observatory of Copernicus into a prison, and is now allowing his dwelling-house to crumble into ruins. But Poland, his native land, has collected some of her last *oboles*, to raise a monument to his memory at Cracow, and to erect a statue of him in Warsaw. This statue is from the hand of the great sculptor Thorvaldsen.

BANNOCKBURN.

O for a gush of Castaly
To undulate my song,
Ye goddess-muses, unto whom
The springs of verse belong!
No matter—there are streams enow
Between the hill and sea,
And every Scots foot on their banks,
Thanks to King Bruce, is free!

I.

The English king hath sworn an oath,
That ere the Baptist's day,
Near Stirling's towers shall England's host
And Scotland's meet in fray;
Such fray as, if it lifts us not
Above all foes and praises,
Shall be the last and bloodiest
Of Scotland's fighting days.

II.

From cot, from castle spread the news
O'er hill, dale, everywhere:
It found God-speed in Liddesdale,
It found God-speed in Ayr;
Among the mosses of Dumfries
The Maxwells caught the omen;
Buchanans told it to Colquhouns,
In the shadow of Ben Lomond;
Makraken gave it to Milroy
On the coast of Galloway,
Where the relics of St Ninian sleep,
And the monks of Balloch pray:
'Twas heard at Ebba's Kirk, and heard
By them that hear the din
Of Corryvrekan, and Cape Wrath,
And Foyers, and Corra Linn;
It spread—it sprang from isle to isle,
From Harris to Tiree;
It roused the red-legged clans of Rosa
And the Dane-mixed men of Dee;
It woke the country of Saint Clair,
And the country of Mackay;
It pierced unto the springs of Clyde,
And the virgin rill of Spey:
It made proud mothers cease to sing,
And maidens to be coy,
But the warrior heard, and ground his teeth,
And cut the air for joy.

III.

That day which makes each week arise,
With the blue eye of Heaven,
It found us on the battle-field,
But not to arms was given;
Yet not to rest, or thought of rest,
With a broad sun blazing o'er us,
And a hundred thousand English swords
Grim gathering before us.
That day the sun went down like blood,
And even when rose the moon,
All the night-air palpitated,
With the fiery heart of June.

IV.

Sir Mowbray stood in chafing mood
On Stirling's old gray wall,
For nought on earth had he to do,
But watch our movements all.
And well he noted every sign:

'The time,' quoth he, 'is brief,
When yonder nodding flags, my boys,
Will bring us all relief.
Another day, one bloody fray,'
Quoth he, 'and I am free;
The mouse may cheep in Stirling keep,
But not, please God, for me.'

V.

Sir Mowbray, as a gallant knight,
Was raised to high command
By the great soul that left its clay
At Borough-on-the-Sand;
And give the old knight his wonted place
Among the Southrons hot,
And let him tread the springy sward,
In teeth of the proud foot;
That arm of his hath pith enough
To show you lion's play,
When the fire flies from flashing eyes,
The blue eyes and the gray.

VI.

Next morn arose as peaceful
As if war had never been,
Though nations twain in battle gear
Were standing in its sheen,
With gilded flags, like Beltane fires,
All gleaming in the sun,
And men on both sides muttering, 'Thus
Shall battle-fields be won!'

VII.

Like waters fed by many streams,
The northern ranks are thronged
With vassal leal and bold outlaw,
The wronger and the wronged;
Grim graybeards that have swung their swords
Around the Wallace wight,
Brave striplings that have fled from home,
But will not flee from fight,
And some who have aforetime fought
Against the leal and true,
Will this day stand in Scotland's van,
And soldier penance do.
Yea, even the knave whose callid life
Has hardly one proud day,
Who comes to plunder, he for once
Is come in time to slay.

VIII.

King Bruce surveyed his mingled host
With no unhelpful eye—
'Let every soldier make his bed,
As he would wish to lie!
I give old Scotland's flag in charge
Of this gray rock,' said he,
'A standard-bearer that shall fly,
Good friends, as soon as we.'

IX.

Our gracious king: right well we knew
How he had played the man,
How he had led an outlaw's life,
And borne the church's ban,
How he had kept his fame so well,
In flight, when doomed to flee,
And how he nursed a heart of ruth
In hottest victory!
Ho! for the men that loved their king,
When loyal men were few!
Ho! for the king that knew his men,
And trusted whom he knew!

X.

Old Maurice of Inchaffray
(Save his gray head from harm!),
To fix our confidence, displayed
Saint Fillan's relic-arm:
But how our hearts beat in us
When we heard the good priest say
That living arms, and layman nerves,
Were all required to-day!
And when he raised the cross, and bade
Us cry unto the Lord,
And seek the grace of every saint
That ever drew a sword,
And pardoned fight, and pardoned fall,
Scarce was the counsel given,
When, hand to heart, and knee to earth,
And every eye on Heaven,
Ye might have heard the abbot's tread,
Unsanctified though he trod,
So breathlessly the Scottish host
Were speaking to their God.

XI.

Now came proud England's battle-burst:
O ladies, 'twere a sight
On which the fairest lady eyes
With joyance would alight,

To see such gallant gentlemen
At tourney, dance, or play!
But this was not a time of mirth,
Or joust or holiday.

XII.

Then Scotland bared her good broad sword,
And baptised it in blood,
And Bannockburn was swollen and red,
But not with rain or mud;
For each man fought as boors might work
In harvest-time or Spring
('Twas the spring-time of Liberty,
And Hate's in-gathering),
Till, on the uneven and pitted ground,
With caltrops thickly sown,
A crop of staggering cavaliers
And plunging steeds was mown;
Till Hereford was prisoner,
Till Gloster's heart was cold
(Brave Gloster's deathbed shall be called
For aye the Bloody Fold);
Till knightly D'Argentine had urged
The southern king away—
Brave D'Argentine, whose one good sword
Almost renewed the fray—
Till home-fast boys and screaming girls
Beheld at Ingram's Crook
Balls of red foam and trunkless heads
Slow sailing down the brook.
The very winds were vocal,
And the dumb hills seemed to cry,
'Your bairns are sleeping at our feet,
Ho! save your homes, or die.'
And saved they were, and safe they are,
And shall be safe and free,
For right was might at Bannockburn,
The great God honoured be!

XIII.

That night by Ninian's sleepless monks
Full many a prayer was said;
That night the trophied tidings brought
Sweet dreams to wife and maid;
That night we bound the wounded up,
To-morrow hid the slain;
One short hour reckoned up our loss—
All time shall count the gain:
For 'tis a story to be held
In memory for aye
How lord and vassal knelt and prayed,
Though not as beadsmen pray;
How lord and vassal rose and fought,
As none had fought before;
And how the burn was choked with knights,
And the marsh half-filled with gore;
And how the northern sun arose,
As sank the southern star;
And how the braggart Southron king
Did ride to reach Dunbar.

XIV.

O luckless, luckless king, that broke
The barb of Edward's name!
O starless breast, that came so far,
And found so little fame!
O well for thee hadst thou been left
With Gloster on the plain!
Thou goest to gall a noble steed,
A steed thou canst not rein.
Thou goest—O luckless, luckless king!—
To Favouritism's foul breath,
To trust a courtier's puny arm,
To Berkeley's horrid death;
And England's wide and motley realm
Holds not so poor a thing,
As thine anointed, witless head,
O luckless, luckless king!

Bannockburn.

J. B. M.

CLIMATE OF AUSTRALIA.

In a country of such vast extent as Australia, spreading over so many degrees of latitude, we might naturally expect to find much diversity in the climate; and such is really the case. Van Diemen's Land, from its isolated and more southern position, is cooler, and characterised by greater humidity than Australia; its vegetation is therefore abundant, and its forests dense and difficult of access. The climate of the continent, on the other hand, between the 25th and 35th degrees of latitude, is much drier, and has a temperature which is probably higher than that of any other part of the world, the thermometer frequently rising to 110 degrees, 120 degrees, and even 130 degrees in the shade, and this high temperature is not unfrequently increased by the hot winds which sweep over the country.

from the northward, and which indicate most strongly the parched and sterile nature of the interior. Unlike other hot countries, this great heat and dryness is unaccompanied by night-dews, and the falls of rain being uncertain and irregular, droughts of many months' duration sometimes occur, during which the rivers and lagoons are dried up, the land becomes a parched waste, vegetation is burnt up, and famine spreads destruction on every side. It is easier for the imagination to conceive, than the pen to depict, the horrors of so dreadful a visitation. The indigenous animals and birds retire to the mountains, or to more distant regions exempt from its influence. Thousands of sheep and oxen perish, bullocks are seen dead by the roadside, or in the dried-up water holes, to which, in the hope of relief, they had dragged themselves, there to fall and die; trees are cut down for the sake of the twigs as fodder; the flocks are driven to the mountains, in the hope that water may there be found, and every effort is made to avert the impending ruin; but in spite of all that can be done, the loss is extreme. At length a change takes place; rain falls abundantly; and the plains, on which but lately not a blade of herbage was to be seen, and over which the stillness of desolation reigned, become free with luxuriant vegetation. *Orchideæ*, and thousands of flowers of the loveliest hues, are profusely spread around, as if nature rejoiced in her renovation; and the grain springing up vigorously, gives promise of an abundant harvest. This change from sterility to abundance in the vegetable world is accompanied by a correspondent increase of animal life; the waters become stocked with fish, the marshy districts with frogs and other reptiles; hosts of caterpillars and other insects make their appearance, and spreading over the surface of the country, commence the work of devastation, which, however, is speedily checked by the birds of various kinds that follow in their train. Attracted by the abundance of food, hawks, of three or four species, in flocks of hundreds, depart from their usual solitary habits, become gregarious and busy at the feast, and thousands of straw-necked ibises (*Ibis spinicollis*) and other species of the feathered race revel in the profusion of a welcome banquet. It must not, however, be imagined that this change is effected without its attendant horrors: the heavy rains often filling the river beds so suddenly that the onward-pouring flood carries with it everything that may impede its course; and wo to the unhappy settler whose house or grounds may lie within the influence of the overwhelming floods! So little has as yet been ascertained respecting the climatology of Western, North-Western, and Northern Australia, that it is not known whether they also are subject to these tremendous visitations; but as we have reason to believe that the intertropical parts of the country are favoured with a more constant supply of rain, as well as a lower degree of temperature, it is probable that they do not there occur.—*Gould's Birds of Australia*.

AFFECTING INCIDENT.

Yesterday morning we witnessed a scene that we little believed could be enacted within the borders of Kentucky. The steamer G. W. Kendall was lying at the wharf at the foot of Wall Street preparing to start to New Orleans. On the fore-castle deck stood a group consisting of a master and five or six slaves, including a woman with a child at the breast, who were apparently going to the south. Just as the last bell of the steamer rang out its peal for departure, and the lines were about to be cast loose, the mother was bidden to give up her infant, and was told that she must go without it. At this intimation the poor creature became frantic with grief. She caressed the child a moment, then flew to her trunk in which she had packed various little articles of clothing she had made up for it to wear. These she first pressed fervently to her lips, and then bestowed them upon the child. Her owner then ordered her to follow him, and she mechanically started to obey; but the promptings of nature were too strong within her swelling breast to be resisted, and with loud sobs of grief she turned, embraced her child, and clung to it with the tenacity of despair. The heartrending grief of the woman, and her frantic gestures, attracted the attention of persons passing along the levee, and strongly excited the sympathies of many. The owner was asked by a gentleman if he would sell the woman and child. To this he assented, and demanded 650 dollars for them. Upon inquiry, however, it was ascertained that the woman was to be sold down the river, and that the child would be disposed of here. The bystanders volunteered to raise subscriptions to buy the child and send it with its mother, and several of them proffered ten dollars

a piece. At this juncture Captain Norton, the captain of the boat, came forward and told the owner of the slaves that he would not take him on his boat, and sent the whole party ashore, and in a few minutes the steamer was seen dashing over the falls without them.—*Louisville Courier*.

HOW ILLNESS IS TO BE BORNE.

If the spirit can so far prevail as to remove the sickness wholly from itself, and banish it into the body only, an immense step is gained; and we may then bear bodily ailments not only with apparent, but with real firmness and tranquillity, and not only bear but draw from them much that softens and purifies the soul. I myself, indeed, though I have been often ill, and occasionally dangerously so, have never had to endure lasting sickness, or even what may be deemed a weak constitution. But I have intimately known many, both men and women, with whom this was the ordinary state, and had no hope of escaping from it but by death. To this class belonged Schiller especially. He suffered much—he suffered continually—and knew, as indeed happened afterwards, that this continual suffering would lead him step by step to the grave. Yet one might truly say of him that he held his illness confined to the body; for at whatever time you visited him, or under whatever circumstances you might meet him, his mind was always calm and cheerful—ready to adapt itself to friendly intercourse, or to interesting and even philosophical conversation. He was, indeed, wont to say that a man worked better under the influence of illness, if it were not too severe; and I have seen him under circumstances which certainly afforded nothing cheering, compose both poems and prose pieces which betrayed no traces in their composition of the illness of the writer.—*Humboldt's Letters*.

INTELLECTUAL LABOUR.

A popular lecturer (Mr Turner) is reported, somewhat confusedly, to have lately spoken as follows:—"He had often heard it said of a man, 'Oh! intellectual pursuits are killing him;' but there never was a man yet who died from intellectual labours, if he paid attention to the other circumstances that ought to be connected with intellectual pursuits. If a man engrossed in study neglects his food, his exercise, and other physical causes so essential to the maintenance of health, is not health likely, to a certain extent, to fall a sacrifice? But intellectual pursuits, corresponding with the taste of the individual, having a tendency to enlarge the mind, so far from being detrimental to health, are highly conducive to it.' Experience enables us to add a decisive testimony to the same effect. It is only when intellectual labours are pursued in harassing circumstances, or in excess, or with a disregard of the common requisites of health, that they prove hurtful.

'MRS CHISHOLM.'

It was omitted to be mentioned by the contributor of the account of Mrs Chisholm, given in No. 326, that the materials were gathered chiefly from Sidney's 'Emigrants' Journal.' This valuable journal, we are sorry to say, has been discontinued, which is probably the reason why our correspondent did not think it necessary to quote its authority.

THE CHAMPIONSHIP OF THE WILD.

It has happened not unfrequently that historical personages have passed under a false character for many generations, and have then all on a sudden been discovered to be something very different from what the world supposed them. We are not prone to change our opinions: on the contrary, the difficulty is to get us to quash a false judgment. Generations for a certain time follow one another in their opinions like a string of geese; and thus a man who is once fairly set up as a hero, may count on some centuries of worship at the least. So also it is with a beast. Your lion continued the king of the forest from time immemorial up to a very recent period. His herculean build, his grave and majestic pace, his thunder-like roar, answered for crown, globe, and sceptre, and his legitimacy was acknowledged in all times and countries. But it was at length put to the test. He was pitted in a fair field with the tiger, and in spite of his airs of superiority, the lion gave in, and his enemy was declared champion of the forest. How many figures of poetry, how many historical associations, were shattered to pieces by this unexpected result! The Hercules in whose divine face the old sculptor had fused the leonine with the human features was henceforth a dishonoured demi-god; and Richard of the Lion-heart found himself linked in the imaginations of men with an animal which turned tail to an enemy.

The new champion maintained the field for a time, and cunning mingled with ferocity—prompting the sneaking circuit, and then the sudden spring—appeared to be the true characteristics of warlike heroism. But already the tiger's reign is at an end, and poetry and sculpture have had hardly time to turn themselves round, when another champion appears pacing the arena supreme and alone, and making its bloody precincts echo to a sound more deep and hoarse than the lion's roar. This is the wild buffalo, whom nature herself appears to have distinguished as a fighting animal, by furnishing him with weapons of offence apparently useless except in battle. The Indian buffalo has been tried repeatedly in a fair stand-up fight with the tiger, and his superiority in strength and courage has been demonstrated so clearly, that in such contact he should be regarded rather as an executioner than a rival. The last noted instance of this barbarous sport of which we have any report, took place at Solo in the island of Java; and to show how nearly the modern Javanese approach in their amusements to the ancient Romans, we present the following account of the affair.

At an early hour in the morning, the population of the whole country-side, men, women, and children, begin to assemble, for it has been bruited abroad that the emperor has doomed the death of five enormous royal

tigers, his menageries having become too populous in this animal. The Dutch resident and his staff have been formally invited to the spectacle; and all the military officers and private gentlemen of the place, together with the lady of the resident, and others of the fair sex, prepare to join the cavalcade. An independent chief, attended by his officers and an escort of cavalry, swells the procession still more, and the native dresses, blended to the eye with the military and civilian costumes of the Europeans, give a romantic richness to the scene, upon which a tropical sun looks down from a cloudless sky.

On arriving at the precincts of the palace, the procession passed through the numerous courts which lead to the dwelling, and in each was saluted by successive bands of drums, horns, and other instruments. Arms were presented and flags lowered as the resident passed; and at length the innermost court was reached, where the emperor sat under his canopy, with the grand band, dressed in white pantaloons and scarlet coats, playing—and playing extremely well—on European instruments. The resident and other invited guests passed up to his majesty through an avenue of chairs, and having enjoyed the honour of a shake of the imperial hand, each retired to his seat. The emperor was dressed in a pair of chintz trousers, red, white, and yellow, which came to his bare ankles, and his stockingless feet were cased in embroidered slippers. A sarang was fastened gracefully round his waist, with a plain dagger stuck in its folds behind. A white vest, a black jacket ornamented with a close row of diamond buttons, and a conical cap of something like white gauze stuck on the top of his head, completed his attire. His hair was dressed in a tail, which hung a little way down his back; and he wore a profusion of rich diamond rings and other ornaments.

After a time—for in the far East nothing is done in a hurry—the emperor and resident got up simultaneously, and walked away together arm in arm, a dwarf bearing his majesty's train, consisting of a portion of the sarang. A crowd of females followed, some carrying stools covered with crimson cloth, another a gold siri box, another a spittoon of the same metal, another an old musket, and among the rest one bearing a golden shield adorned with diamonds, rubies, and numerous other precious stones in great profusion. The ladies, to the number of twenty, who carried these insignia of rank and state, were somewhat elderly, and they were followed by about thirty more a little younger—all with bare shoulders, and a few with bands of gold lace wound round their necks, and the ends hanging down before and behind. Following, and intermingling with this singular guard of honour, came the European visitors without distinction of rank; and as the crowd—for it could not be called a procession—passed through the successive courts, they were drummed and trumpeted

from one to another, till they at length reached the ground, distinguished by another tent or canopy, under which the emperor and resident seated themselves. This place was guarded by a band of beautiful girls, arrayed in yellow sarangs and tightly-fitting dresses, whose delicate yellow skins contrasted charmingly with their dark shining hair and sparkling eyes. The principal courtiers, and some of the royal family, were squatted on the ground; but the European guests and the independent native chief were provided with red chairs. At a respectful distance squatted the prime minister and his attendants on the bare sand.

It being announced that the tigers were ready at the imperial command, wine was handed round to the general company. A characteristic circumstance now occurred. The lady of the resident came up to take her seat under the canopy, attended by a crowd of ladies; but although she passed close to his majesty, he did not notice her even by a glance, but continued staring straight before him. In the far East it is unpolite to look at another man's spouse; and to ask her husband after her health is considered the height of rudeness.

The emperor and resident now got up once more, and walked away arm in arm, followed by the guard of women—exactly according to the rule of the Surrey theatre in its palmy days of the melodrama. This time they halted near the pen in which the fight was to take place, and then they sat down once more, the company standing round them. The pen was not more than fifteen or sixteen feet in diameter, and it was enclosed with teak posts bound with withes of bamboo.

Now appeared the true hero of the day—a fine black male buffalo, with whitened horns and a garland of flowers round his neck. He stood in the middle of the pen, the observed of all observers, and eyeing the crowd in his turn with a fierce and surprised look. But presently, when a royal tiger tumbled in, this look became more intense; and it was returned with exaggeration when the visitor observed on whose privacy he had involuntarily intruded. The animals, who would have rushed at each other in the desert, only gazed in shy astonishment; the buffalo keeping his place in the centre, but wheeling round as on a pivot, with his head down and horns levelled, as the tiger sneaked slowly round the edge of the circle. How long this would have gone on is hard to say. The tiger, inspired at once with hate and fear, sought instinctively for a weak point, yet dared not spring; while the buffalo, stern and self-possessed, knew too well the treacherous nature of his enemy to abate his vigilance, but seemed willing, under the unaccountable circumstances of the meeting, to decline a combat if possible.

The music, however, had already commenced to which the actors were to fight; and as the roll of the drum, the clang of the trumpet, and the thunder of the gong became fiercer, and faster, and wilder, the movements of the destined combatants kept time. Confused with the noise, and with the wild gestures and exciting cries of the attendants, the animals gradually lost their self-command such as it was. Patience, prudence, reflection, everything gave way. The roar of the music, and the yells of the spectators, seemed as so many insults and outrages which instinctive animosity traced to the 'natural enemy.' Maddened by the ceaseless din, the animals knew no longer what they were about, but came in contact in the middle of the arena, and wreaked on each other their concentrated rage. Again and again the tiger, butted against the enclosure,

lost heart, and sneaked away; but again and again he returned to the charge, only to be butted anew. At length the desperate animal, climbing to the top of the enclosure, sprang down upon the head and shoulders of his enemy. A moment the spectators were in doubt—but only a moment; for the buffalo, without giving him time to fasten, threw him yelling back into the air. Again the brute adopted the same stratagem—again, again, and again, in such rapid succession, that the eye could scarcely follow his motions; but each time he was flung up again as energetically as at first, till at length he stirred no more after his fall, but lay dying or dead upon the ground, and was dragged away.

A second tiger was thrown in to the same buffalo; but this time the coyness and surprise were all on the part of the former. The buffalo now knew what the thing meant, and the second combat was over in a moment. The tiger was drawn away senseless by the attendants, while the conqueror marched off on his legs.

So much for the championship of the buffalo. But we must now show how the remainder of the tigers were disposed of, this being the second and final act of this horrid melodrama. Another circular piece of ground was chosen for the new exhibition, not fifteen feet, but 300 feet in diameter, and its walls were composed of lines of men standing several rows deep, each armed with a long spear. These troops were clad in red, yellow, blue, and green jackets; and the interval between them and the platform where the emperor and his visitors sat was occupied by his guards, armed with rifles, spears, swords, and other weapons. The circle was closed round by humbler spectators, to the number of several thousands; while every roof, tree, wall, or elevation of any kind in the neighbourhood was crowded with men, women, and children.

In the centre of the ring were the oblong cages of the tigers, hung round with a kind of long grass, so as to hide the inmates; and behind these were two others, shaped like dish-covers, resting on the ground, within which were the men whose office it was to minister on the occasion, as will presently be explained. Three other attendants, however, stood openly by the cages, and it was their duty to perform the manœuvres intrusted to them at the motion of the emperor's arm. The first sign made, one of them, after making his slow and reverential obeisance to the emperor, mounted upon the top of one of the cages, and with a graceful motion severed with his hatchet the string which bound the door. He then drew the door up, and slapped it quickly down in its groove several times; then pulled it entirely out, and threw it upon the ground. This done, he made another obeisance, and leaping down, seated himself by that terrible aperture, which had now nothing more than a bunch of grass hanging before it for a curtain! His two companions, in the meantime, were behind the cage, preparing their burning wisps to set fire to the grass hung round it.

It may be supposed that this was a moment of intense excitement, for there appeared to be nothing to prevent the tiger from issuing from his den, and the distance to the serried line of spears was 150 feet. The imperial sign was at length given; and the man at the mouth of the cage slowly and gracefully bowed himself to the dust, and then rose up and joined his companions. They now set fire to the grass upon the cages, and then all three placed themselves in line; then the music struck up, and with a dancing movement, composed of a succession of leaps, with pauses between, executed as if

by one man, they began to move slowly towards the boundary of the circle. The tiger in the meantime came out, tail foremost, and looked round with surprise and fury at the array before him. The spectators held their breath; for the dancers, in the frenzy of a fantastic honour, still kept time, and that odious measure still kept its prescribed andante. He sees them—he lashes his tail—he moves forward; but they only give another jump, and then make another pause in obedience to the music. The tiger re-enters his cage! and the dancers at length reach the circle of spears, which opens and shrouds them from sight.

The fire, in the meantime, had not communicated so completely with the cage as to expel the tiger from his den; it, however, soon did so; and the grass bursting into flames, the tiger bounded out. Then struck up the music, then rolled the drum, then clanged the trumpet, then thundered the gong, then shouted the men, then screamed the women; and the denizen of the forest, confounded with the heterogeneous salute, shrunk back into his den. But not long could he stand the heat and smoke; and with slow gliding pace, and eyes rolling in calm desperation round the circle, he returned deliberately into the open space; and prowling backwards and forwards in front of the emperor, whom he no doubt recognised as the commander of the host of enemies, he appeared to be consulting with his own quaking heart on his awful predicament. Sometimes he approached the line; but his courage failed at the sight of the glittering spears, the blades of which converged on all sides, with his body as the centre to which they pointed. Then he retreated to observe the state of his burning den; but deriving no comfort from the view, he stood still, as if in despair, with his lower jaw hanging down. At length, rousing himself from his lethargy, he made a sudden rush at the armed ring—from which he was thrown back bleeding. Galloping round the circle, he tried point after point as quick as thought, but always baffled, always wounded. At length concentrating his energies, he made so desperate a charge near the royal stand that his enemies gave way. In an instant he was through the line; in another he had passed under a carriage in which some ladies were sitting; and in a third he had flashed by the side of the old prime minister, who sat upon the sand eyeing the feat with the most imperturbable coolness. But here his sudden good fortune as suddenly deserted him: the lancers were round him in a compact body; he was pinned to the ground in an instant; and he yielded up his hope and his life together.

The other tigers were destroyed in a similar manner under circumstances of more or less excitement; and then the emperor and his guests, satisfied with the sport, returned with the same state in which they had come. It perhaps occurred to some of the company, as they retired from the field, musing and silent, to speculate on the power of the animals they had seen, rendered useless for any great purpose by the restricted nature of their instincts. Man alone has his comparatively insignificant strength directed by Reason; and thus, with his other titles of power and dominion, he is the true Champion of the Wild. But the higher this reason advances—the further he recedes from the brute kind—the less amusement he finds in the agonies of the inferior animals. Such is a picture of modern sports in the East—such is what was presented to the populace of ancient Rome—such is pretty much what was tolerated in England at no very distant date. The sentiments which are now aroused amongst us on hearing of practices so revolting to humanity, mark the great advance which has latterly been made in public taste and feeling. That the spread of Christianity in

the East will gradually lead to the abolition of the fiendish pastimes just referred to, is past all reasonable doubt.*

WEAVERS AND MINERS AT AIRDRIE.

WE had lately occasion to spend some time in the populous weaving and mining district of Airdrie in the west of Scotland. Nothing struck us more than the great longevity of many of the original inhabitants of the place, who in their old years have been subjected to all the privation consequent on low wages for the last twenty years. One of these we found to be above ninety years of age, and several others had reached the age of seventy or eighty. Some of these old men are paupers, and depend on the small pittance allowed them by the parish, amounting to about 4s. a month, and the casual charity of the people of the place. On the other hand, it is exceedingly rare to meet with a hale old man belonging to any other class—old men among the mining population are exceedingly rare.

The privations to which the handloom weavers have been subjected have been the means of making the most of their young men turn their attention to the more lucrative occupation of mining, so that the marriage of a weaver is rather a rare occurrence. The miners, however, are under no restraint in this respect, and the number of children belonging to them is sufficiently numerous to excite surprise, as well as forebodings of want and misery.

Among the handloom weavers, those who have families appeared to have suffered least from the pressure of the times. Their sons and daughters being generally put to the loom at the age of eight or nine years, become in a short time able to make as much as 1s. per day; and this, added to their fathers' income, creates a kind of competence we do not meet with in families differently situated. It doubtless requires the greatest frugality to make 'the two ends meet.' Meal and milk and Scotch broth are the chief fare. It is no uncommon thing for the wife of a weaver to follow the same occupation as himself, particularly when there are few or no children in the case. His condition is also often much ameliorated by the employment of apprentices, who are frequently obtained from the charity workhouses of Edinburgh or Glasgow. These it is his duty to feed, clothe, and educate by sending to a night school; though, we must add, this latter part of his duty is often sadly neglected. With all these means, the married weaver is often a respectable, well-dressed, church-going individual: the blanched and sunk cheek, however, generally tells a tale of privation and suffering which has been endured with a patience altogether unexampled.

The weavers are by no means satisfied that they receive justice from their employers. Prices, they maintain, are kept unnecessarily low. They seem to forget that this is the result of excessive competition. But there is another ground of complaint which we have often heard made by them—namely, that when work is scarce, and it becomes a favour to obtain a web from a warehouse, there is a continually expressed dissatisfaction at the quality of the workmanship, and stoppages made, which would not be submitted to in better times. It is to be hoped that this censure, if just, can only apply to a few.

The old mining body has been wonderfully changed in its composition, in consequence of the introduction of labourers and weavers into the pits and mines during the period of their many strikes. Their wages, from the same cause, are reduced from 5s. to 2s. 6d. or 3s. per day. The continual agitation the body kept up when they enjoyed high wages, and their often not working more than half time, in order that the stock of minerals at the pit's mouth might not be too much augmented, led to a resolution on the part of the masters to withstand

* The facts in the above sketch are derived from the last number of the 'Journal of the Indian Archipelago,' published at Singapore.

the claims constantly being made for enlarged wages; and the effect has been so far ruinous to the miner, that his wages are not much more than one-half of what they used to be, and his monopoly of employment destroyed. Under these circumstances, he perseveringly vents his discontent; but unavailingly. When the question is considered in a moral point of view, it is doubtful whether the miners are not better with a moderate than a high wage, the latter in all instances having led them into extravagant ideas of their own importance and into unreasonable demands. Considering, however, the nature of his work, its unhealthy character, and the danger to which the miner is exposed as to loss of life and limb, it is unjust to deny him the means of a comfortable subsistence, and of saving something against old age. It seems to be a general opinion that he should be able to make 3s. 6d. a day, even at the present low market prices of food and clothing. What in many parts prevents them doing so is, that the able-bodied man is not allowed to dig a greater quantity of coal or stone than the old and the infirm, and when a day is lost, the loss cannot be repaired by extra toil on the ensuing day or days. Combination has been the bane of the mining body, and in parts of the country where it does not exist, the workman is invariably in better circumstances.

It is not to be wondered at that men toiling in the bowels of the earth should be comparatively ignorant of what occurs in the upper world, and accordingly colliers are proverbial for their ignorance. This by no means applies to the whole of the body, many of which are as intelligent and enlightened men as are to be met with among other trades. The cause of the ignorance alluded to is partly, if not wholly, the early age at which their boys are sent into the pit. A boy above ten years of age is rarely to be seen in a school situated at a colliery. The boys are taken into the pit at this early age, and made to assist the elder ones in drawing. The father is entitled to 'put out' a quarter more than his allotted task; thus, if he made 3s. a day, he now earns 3s. 9d. At later periods the 'quarter man' becomes a 'half man,' and a 'three-quarter man,' and finally a whole man when he attains his seventeenth year. It is designed that the boy should attend the evening school, but the attendance is very irregular in general; and there he merely learns to write and cipher, or read the merest elementary book. It would be great injustice to say of the miners as a body that they are given to drunkenness. A drinking-bout after the pay, however, is only too frequent, and the use of tobacco is general.

How much this class of men may be improved, the history of Chapelhall, a village connected with Monkland Steel Works, will show. It was eighteen years ago a mere hamlet, consisting of a few newly-built houses and one old farm-house. It is now a considerable village, with perhaps from 2000 to 3000 inhabitants, and consists of well-built and comfortable houses of one and two storeys, the interiors of which are usually well furnished. Nearly one-half of the village is the property of the workmen, a number of whom are 'lairds' of several tenements. These lairds are industrious men, to whom the proprietor of the estate, John Robertson, Esq., Laehup, lent money as soon as they were able to add a few pounds to it, to build a house suited to the family of the borrowers. This money, obtained at 5 per cent. interest, and payable with the feu duty, the feuar becomes naturally anxious to pay up; and often in a year or two he has been able to do so by savings from his own earnings and that of his family. When this has been done, another sum, adequate to build another house, is at his command; and thus on the same feu there have been reared, in process of time, a number of houses, from which the feuar derives a considerable yearly income. The erection of a house consisting of one apartment, containing a window and two beds, costs little more than L.30, and a rental of L.3, or even L.3, 10s., is obtained for it. Many of the houses, however, consist of a room and kitchen.

The plan of assessment for educational purposes at these works, which are very extensive, deserves notice and imitation. Every man and boy employed at the work is assessed twopence per week for school fees, for which he can send one scholar, or attend himself. For every additional scholar he is charged an additional penny. The sum thus collected at the office is divided among the various schoolmasters—of whom there are six, besides assistants—according to the number of scholars attending each. The sum collected from those who do not attend school or send a child to it is equally divided among the six teachers. The entire amount thus collected in one month is above L.70, leaving about L.2 a week for each of the principal teachers, and L.1 for his assistant. The effect of the system is to draw out the children, who, were their parents not forced to pay, would, in perhaps a majority of instances, be allowed to remain at home.

The crowded state of the schools, some of which are attended by from 150 to 200 scholars, will furnish some idea of the progress of population. I have often asked myself what is to become of the mass of beings brought into existence at these and the similar works in the neighbourhood when the blackband ironstone becomes exhausted, which it must do at no distant date? In reply, the ironstone of Scotland is almost inexhaustible, and while the Monkland coal lasts, the furnaces will blaze away and the sound of industry be heard; but there seems little reason to expect, as the population increases at these works, as increase it must, that a demand for labour will also arise; and what, then, will become of the redundant population? Much misery ere long must ensue: the girls must go to service to town, and the boys find employment elsewhere, either in their native land, or with their expatriated brethren in America, Australia, or Natal; where, though years of toil may await them, with perseverance and virtuous industry, competence, independence, and happiness are sure to be ultimately obtained.

EXPERIENCES OF A BARRISTER.

THE REFUGEE.

THE events which I am about to relate occurred towards the close of the last century, some time before I was called to the bar, and do not therefore in strictness fall within my own experiences as a barrister. Still, as they came to my knowledge with much greater completeness than if I had been only professionally engaged to assist in the catastrophe of the drama through which they are evolved, and, as I conceive, throw a strong light upon the practical working of our criminal jurisprudence, a brief page of these slight leaves may not inappropriately record them.

About the time I have indicated, a Mrs Rushton, the widow of a gentleman of commercial opulence, resided in Upper Harley Street, Cavendish Square. She was a woman of 'family,' and by her marriage had greatly lowered herself, in her relatives' opinion, by a union with a person who, however wealthy and otherwise honourable, was so entirely the architect of his own fortunes—owed all that he possessed so immediately to his own skill, sagacity, and perseverance—that there was an unpleasant rumour abroad about his widowed mother being indebted to her son's success in business for having passed the last ten years of her life in ease and competence. Mr Rushton had left his widow a handsome annuity, and to his and her only son a well-invested income of upwards of seven thousand a year. Since the death of her husband, Mrs Rushton, who inherited quite her full share of family pride, if nothing else, had sought by every method she could devise to re-enter the charmed circle from which her union with

a city merchant had excluded her. The most effectual mode of accomplishing her purpose was, she knew, to bring about a marriage between her son and a lady who would not be indisposed to accept of wealth and a well-appointed establishment in Mayfair as a set-off against birth and high connection.

Arthur Rushton, at this time between two and three-and-twenty years of age, was a mild, retiring, rather shy person, and endowed with a tenderness of disposition, of which the tranquil depths had not as yet been ruffled by the faintest breath of passion. His mother possessed almost unbounded influence over him; and he ever listened with a smile, a languid, half-disdainful one, to her eager speculations upon the numerous eligible matches that would present themselves the instant the 'season' and their new establishment in Mayfair—of which the decoration and furnishing engaged all her available time and attention—enabled them to open the campaign with effect. Arthur Rushton and myself had been college companions, and our friendly intimacy continued for several years afterwards. At this period especially we were very cordial and unreserved in our intercourse with each other.

London at this time was crowded with French exiles, escaped from the devouring sword of Robespierre and his helpers in the work of government by the guillotine, almost all of whom claimed to be members of, or closely connected with, the ancient nobility of France. Among these was an elderly gentleman of the name of De Tourville, who, with his daughter Eugénie, had for a considerable time occupied a first floor in King Street, Holborn. Him I never saw in life, but Mademoiselle de Tourville was one of the most accomplished, graceful, enchantingly-interesting persons I have ever seen or known. There was a dangerous fascination in the pensive tenderness through which her natural gaiety and archness of manner would at intervals flash, like April sunlight glancing through clouds and showers, which, the first time I saw her, painfully impressed as much as it charmed me—perceiving, as I quickly did, that with her the future peace, I could almost have said life, of Arthur Rushton was irrevocably bound up. The fountains of his heart were for the first time stirred to their inmost depths, and, situated as he and she were, what but disappointment, bitterness, and anguish could well-up from those troubled waters? Mademoiselle de Tourville, I could perceive, was fully aware of the impression she had made upon the sensitive and amiable Englishman; and I sometimes discovered an expression of pity—of sorrowful tenderness, as it were—pass over her features as some distincter revelation than usual of the nature of Arthur Rushton's emotions flashed upon her. I also heard her express herself several times, as overtly as she could, upon the *impossibility* there existed that she should, however much she might desire it, settle in England, or even remain in it for any considerable length of time. All this I understood, or thought I did, perfectly; but Rushton, bewildered, entranced by feelings altogether new to him, saw nothing, heard nothing but her presence, and felt, without reasoning upon it, that in that delirious dream it was his fate either to live or else to bear no life. Mrs Rushton—and this greatly surprised me—absorbed in her matrimonial and furnishing schemes and projects, saw nothing of what was going on. Probably the notion that her son should for an instant think of allying himself with an obscure, portionless foreigner, was, to a mind like hers, too absurd to be for a moment entertained; or— But stay: borne along by a crowd of

rushing thoughts, I have, I find, somewhat anticipated the regular march of my narrative.

M. and Mademoiselle de Tourville, according to the after-testimony of their landlord Mr Osborn, had, from the time of their arrival in England, a very constant visitor at their lodgings in King Street. He was a tall French gentleman, of perhaps thirty years of age, and distinguished appearance. His name was La Houssaye. He was very frequently with them indeed, and generally he and M. de Tourville would go out together in the evening, the latter gentleman not returning home till very late. This was more especially the case after Mademoiselle de Tourville ceased to reside with her father.

Among the fashionable articles with which Mrs Rushton was anxious to surround herself, was a companion of accomplishments and high-breeding, who might help her to rub off the rust she feared to have contracted by her connection with the city. A Parisian lady of high lineage and perfect breeding might, she thought, be easily obtained; and an advertisement brought Mademoiselle de Tourville to her house. Mrs Rushton was delighted with the air and manners of the charming applicant; and after a slight inquiry by letter to an address of reference given by the young lady, immediately engaged her, on exceedingly liberal terms, for six months—that being the longest period for which Mademoiselle de Tourville could undertake to remain. She also stipulated for permission to pass the greater part of one day in the week—that which might happen to be most convenient to Mrs Rushton—with her father. One other condition testified alike to M. de Tourville's present poverty and her own filial piety: it was, that her salary should be paid weekly—she would not accept it in advance—avowedly for her parent's necessities, who, poor exile! and tears stood in Eugénie's dark lustrous eyes as she spoke, was ever trembling on the brink of the grave from an affection of the heart with which he had been long afflicted. Mademoiselle de Tourville, I should state, spoke English exceedingly well as far as the rules of syntax and the meanings of words went, and with an accent charming in its very defectiveness.

She had resided with Mrs Rushton, who on all occasions treated her with the greatest kindness and consideration, for rather more than two months, when an incident occurred which caused the scales to fall suddenly from the astonished mother's eyes, and in a moment revealed to her the extent of the risk and mischief she had so heedlessly incurred. The carriage was at the door, and it struck Mrs Rushton as she was descending the stairs that Mademoiselle de Tourville, who had complained of headache in the morning, would like to take an airing with her. The sound of the harp issuing from the drawing-room, and the faintly-distinguished tones of her voice in some plaintive silver melody perhaps suggested the invitation; and thither the mistress of the mansion at once proceeded. The folding-doors of the back drawing-room were partially open when Mrs Rushton, on kind thoughts intent, entered the front apartment. Mademoiselle de Tourville was seated with her back towards her at the harp, pouring forth with her thrilling and delicious voice a French romaunt; and there, with his head supported on his elbow, which rested on the marble chimney-piece, stood her son, Arthur Rushton, gazing at the apparently-unconscious songstress with a look so full of devoted tenderness—so completely revealing the intensity of passion by which he was possessed—that Mrs Rushton started with convulsive affright, and could not for several minutes give articulation to the dismay and rage which choked her utterance. Presently, however, her emotions found expression, and a storm of vituperative abuse was showered upon the head of the astonished Eugénie, designated as an artful *intrigante*, a designing pauper, who had insinuated herself into the establishment for the sole purpose of entrapping Mr Arthur Rushton—with a great deal

more to the same effect. Mademoiselle de Tourville, who had first been too much surprised by the unexpected suddenness of the attack to quite comprehend the intent and direction of the blows, soon recovered her self-possession and hauteur. A smile of contempt curled her beautiful lip, as, taking advantage of a momentary pause in Mrs Rushton's breathless tirade, she said, 'Permit me, madam, to observe that if, as you seem to apprehend, your son has contemplated honouring me by the offer of an alliance with his ancient House'— Her look at this moment glanced upon the dreadfully-agitated young man; the expression of disdainful bitterness vanished in an instant from her voice and features; and after a few moments, she added, with sad eyes bent upon the floor, 'That he could not have made a more unhappy choice—more unfortunate for him, more impossible for me!' She then hastily left the apartment, and before a quarter of an hour had elapsed, had left the house in a hackney-coach.

The scene which followed between the mother and son was a violent and distressing one. Mr Rushton, goaded to fury by his mother's attack upon Mademoiselle de Tourville, cast off the habit of deference and submission which he had always worn in her presence, and asserted with vehemence his right to wed with whom he pleased, and declared that no power on earth should prevent him marrying the lady just driven ignominiously from the house if she could be brought to accept the offer of his hand and fortune! Mrs Rushton fell into passionate hysterics; and her son, having first summoned her maid, withdrew to ruminate on Mademoiselle de Tourville's concluding sentence, which troubled him far more than what he deemed the injustice of his mother.

When Mrs Rushton, by the aid of water, pungent essences, and the relief which even an hour of time seldom fails to yield in such cases, had partially recovered her equanimity, she determined, after careful consideration of the best course of action, to consult a solicitor of eminence, well acquainted with her late husband, upon the matter. She had a dim notion that the Alien Act, if it could be put in motion, might rid her of Mademoiselle de Tourville and her friends. Thus resolving, and ever scrupulous as to appearances, she carefully smoothed her ruffled plumage, changed her disordered dress, and directed the carriage, which had been dismissed, to be again brought round to the door. 'Mary,' she added a few moments afterwards, 'bring me my jewel-case—the small one: you will find it in Made—in that French person's dressing-room.'

Mary Austin reappeared in answer to the violent ringing of her impatient lady's bell, and stated that the jewel-case could nowhere be found in Mademoiselle's dressing-room. 'Her clothes, everything belonging to her, had been taken out of the wardrobe, and carried away, and perhaps that also in mistake no doubt.'

'Nonsense, woman!' replied Mrs Rushton. 'I left it not long ago on her toilet-glass. I intended to show her a purchase I had made, and not finding her, left it as I tell you.'

Another search was made with the same ill success. Mary Austin afterwards said that when she returned to her mistress the second time, to say that the jewel-case was certainly gone, an expression of satisfaction instead of anger, it seemed to her, glanced across Mrs Rushton's face, who immediately left the room, and in a few minutes afterwards was driven off in the carriage.

About an hour after her departure I called in Harley Street for Arthur Rushton, with whom I had engaged to go this evening to the theatre to witness Mrs Siddons's *Lady Macbeth*, which neither of us had yet seen. I found him in a state of calmed excitement, if I may so express myself; and after listening with much interest to the minute account he gave me of what had

passed, I, young and inexperienced as I was in such affairs, took upon myself to suggest that, as the lady he nothing doubted was as irreproachable in character as she was confessedly charming and attractive in person and manners, and as he was unquestionably his own master, Mrs Rushton's opposition was not likely to be of long continuance; and that as to Mademoiselle de Tourville's somewhat discouraging expression, such sentences from the lips of ladies—

'That would be wooed, and not unsought be won!—

were seldom, if ever, I had understood, to be taken in a literal and positive sense. Under this mild and soothing treatment Mr Rushton gradually threw off a portion of the load that oppressed him, and we set off in tolerably cheerful mood for the theatre.

Mrs Siddons's magnificent and appalling impersonation over, we left the house; he, melancholy and sombre as I had found him in Harley Street, and I in by no means a gay or laughing mood. We parted at my door, and whether it was the effect of the tragedy, so wonderfully realised in its chief creation, or whether coming events do sometimes cast their shadows before, I cannot say, but I know that an hour after Rushton's departure I was still sitting alone, my brain throbbing with excitement, and so nervous and impressionable, that a sudden, vehement knocking at the street entrance caused me to spring up from my chair with a terrified start, and before I could master the impulsive emotion, the room-door was thrown furiously open, and in reeled Arthur Rushton—pale, haggard, wild—his eyes ablaze with horror and affright! Had the ghost of Duncan suddenly gleamed out of the viewless air I could not have been more startled—awed!

'She is dead!—poisoned!' he shrieked with maniacal fury; 'killed!—murdered!—and by her!'

I gasped for breath, and could hardly articulate—'What! whom?'

'My mother!' he shouted with the same furious vehemence—'Killed! by her! Oh, horror!—horror!—horror!' and exhausted by the violence of his emotions, the unfortunate gentleman staggered, shuddered violently, as if shaken by an ague fit, and fell heavily—for I was too confounded to yield him timely aid—on the floor.

As soon as I could rally my scattered senses, I caused medical aid to be summoned, and got him to bed. Blood was freely taken from both arms, and he gradually recovered consciousness. Leaving him in kind and careful hands, I hurried off to ascertain what possible foundation there could be for the terrible tidings so strangely announced.

I found the establishment in Harley Street in a state of the wildest confusion and dismay. Mrs Rushton was dead; that, at all events, was no figment of sudden insanity, and incredible, impossible rumours were flying from mouth to mouth with bewildering rapidity and incoherence. The name of Mademoiselle de Tourville was repeated in every variety of abhorrent emphasis; but it was not till I obtained an interview with Mrs Rushton's solicitor that I could understand what really had occurred, or, to speak more properly, what was suspected. Mrs Rushton had made a deposition, of which Mr Twyte related to me the essential points. The deceased lady had gone out in her carriage with the express intention of calling on him, the solicitor, to ascertain if it would be possible to apply the Alien Act to Mademoiselle de Tourville and her father, in order to get them sent out of the country. Mr Twyte did not happen to be at home, and Mrs Rushton immediately drove to the De Tourvilles' lodgings in King Street, Holborn, with the design, she admitted, of availing herself of what she was in her own mind satisfied was the purely accidental taking away of a jewel-case, to terrify Mademoiselle de Tourville, by the threat of a criminal charge, into leaving the country, or at least to bind herself not to admit, under any circumstances, of Mr Arthur Rushton's addresses. She found Eugénie in a

state of extraordinary, and it seemed painful excitement; and the young lady intreated that whatever Mrs Rushton had to say should be reserved for another opportunity, when she would calmly consider whatever Mrs Rushton had to urge. The unfortunate lady became somewhat irritated at Mademoiselle de Tourville's obstinacy, and the unruffled contempt with which she treated the charge of robbery, even after finding the missing jewel-case in a band-box, into which it had been thrust with some brushes and other articles in the hurry of leaving. Mrs Rushton was iterating her threats in a loud tone of voice, and moved towards the bell to direct, she said, the landlord to send for a constable, but with no intention whatever of doing so, when Mademoiselle de Tourville caught her suddenly by the arm, and bade her step into the next room. Mrs Rushton mechanically obeyed, and was led in silence to the side of a bed, of which Eugénie suddenly drew the curtain, and displayed to her, with a significant and reproachful gesture, the pale, rigid countenance of her father's corpse, who had, it appears, suddenly expired. The shock was terrible. Mrs Rushton staggered back into the sitting-room, sick and faint, sank into a chair, and presently asked for a glass of wine. 'We have no wine,' replied Mademoiselle de Tourville; 'but there is a cordial in the next room which may be better for you.' She was absent about a minute, and on returning, presented Mrs Rushton with a large wine-glassful of liquid, which the deceased lady eagerly swallowed. The taste was strange, but not unpleasant; and instantly afterwards Mrs Rushton left the house. When the carriage reached Harley Street, she was found to be in a state of great prostration: powerful stimulants were administered, but her life was beyond the reach of medicine. She survived just long enough to depose to the foregoing particulars; upon which statement Mademoiselle de Tourville had been arrested, and was now in custody.

'You seem to have been very precipitate,' I exclaimed as soon as the solicitor had ceased speaking: 'there appears to be as yet no proof that the deceased lady died of other than natural causes.'

'You are mistaken,' rejoined Mr Twyte. 'There is no doubt on the subject in the minds of the medical gentlemen, although the *post-mortem* examination has not yet taken place. And, as if to put aside all doubt, the bottle from which this Eugénie de Tourville admits she took the cordial proves to contain distilled laurel-water, a deadly poison, curiously coloured and flavoured.'

Greatly perturbed, shocked, astonished as I was, my mind refused to admit, even for a moment, the probability, hardly the possibility, of Eugénie de Tourville's guilt. The reckless malignancy of spirit evinced by so atrocious an act dwelt not, I was sure, within that beautiful temple. The motives alleged to have actuated her—fear of a criminal charge, admitted to be absurd, and desire to rid herself of an obstacle to her marriage with Arthur Rushton—seemed to me altogether strained and inapplicable. The desperation of unreasoning hate could alone have prompted such a deed; for detection was inevitable, had, in truth, been courted rather than attempted to be avoided.

My reasoning made no change in the conclusions of Mr Twyte the attorney for the prosecution, and I hastened home to administer such consolation to Arthur Rushton as might consist in the assurance of my firm conviction that his beloved mother's life had not been wilfully taken away by Eugénie de Tourville. I found him still painfully agitated; and the medical attendant told me it was feared by Dr — that brain fever would supervene if the utmost care was not taken to keep him as quiet and composed as, under the circumstances, was possible. I was, however, permitted a few minutes' conversation with him; and my reasoning, or, more correctly, my confidently-expressed belief—for his mind seemed incapable of following my argument, which it indeed grasped faintly at, but slipped from, as it were, in an instant—appeared to relieve him wonderfully. I

also promised him that no legal or pecuniary assistance should be wanting in the endeavour to clear Mademoiselle de Tourville of the dreadful imputation preferred against her. I then left him. The anticipation of the physician was unfortunately realised: the next morning he was in a raging fever, and his life, I was informed, was in very imminent danger.

It was a distracting time; but I determinedly, and with much self-effort, kept down the nervous agitation which might have otherwise rendered me incapable of fulfilling the duties I had undertaken to perform. By eleven o'clock in the forenoon I had secured the active and zealous services of Mr White, one of the most celebrated of the criminal attorneys of that day. By application in the proper quarter, we obtained immediate access to the prisoner, who was temporarily confined in a separate room in the Red-Lion Square Lock-up House. Mademoiselle de Tourville, although exceedingly pale, agitated, and nervous, still looked as lustrously pure, as radiantly innocent of evil thought or deed, as on the day that I first beheld her. The practised eye of the attorney scanned her closely. 'As innocent of this charge,' he whispered, 'as you or I.' I tendered my services to the unfortunate young lady with an earnestness of manner which testified more than any words could have done how entirely my thoughts acquitted her of offence. Her looks thanked me; and when I hinted at the promise exacted of me by Arthur Rushton, a bright blush for an instant mantled the pale marble of her cheeks and forehead, indicating with the tears, which suddenly filled and trembled in her beautiful eyes, a higher sentiment, I thought, than mere gratitude. She gave us her unreserved confidence; by which, after careful sifting, we obtained only the following by no means entirely satisfactory results:—

Mademoiselle de Tourville and her father had escaped from the Terrorists of France by the aid of, and in company with, the Chevalier la Houssaye, with whom M. de Tourville had previously had but very slight acquaintance. The chevalier soon professed a violent admiration for Eugénie; and having contrived to lay M. de Tourville under heavy pecuniary obligations at play—many of them Mademoiselle de Tourville had only very lately discovered—prevailed upon his debtor to exert his influence with his daughter to accept La Houssaye's hand in marriage. After much resistance, Mademoiselle de Tourville, overcome by the commands, intreaties, prayers of her father, consented, but only on condition that the marriage should not take place till their return to France, which it was thought need not be very long delayed, and that no more money obligations should in the meantime be incurred by her father. La Houssaye vehemently objected to delay; but finding Eugénie inexorable, sullenly acquiesced. It was precisely at this time that the engagement with Mrs Rushton was accepted. On the previous afternoon Mademoiselle de Tourville, on leaving Harley Street after the scene with the deceased lady, went directly home, and there found both her father and the chevalier in hot contention and excitement. As soon as La Houssaye saw her, he seized his hat, and rushed out of the apartment and house. Her father, who was greatly excited, had barely time to say that he had fortunately discovered the chevalier to be a married man, whose wife, a woman of property, was still living in Languedoc, when what had always been predicted would follow any unusual agitation happened: M. de Tourville suddenly placed his hand on his side, uttered a broken exclamation, fell into a chair, and expired. It was about two hours after this melancholy event that Mrs Rushton arrived. The account before given of the interview which followed was substantially confirmed by Mademoiselle de Tourville; who added, that the cordial she had given Mrs Rushton was one her father was in the constant habit of taking when in the slightest degree excited, and that she was about to give him some when he suddenly fell dead.

We had no doubt, none whatever, that this was the whole, literal truth, as far as the knowledge of Mademoi-

selle de Tourville extended; but how could we impart that impression to an Old Bailey jury of those days, deprived as we should be of the aid of counsel to address the jury, when in reality a speech, pointing to the improbabilities arising from character, and the altogether unguilty-like mode of administering the fatal liquid, was the only possible defence? Cross-examination promised nothing; for the evidence would consist of the dying deposition of Mrs Rushton, the finding of the laurel-water, and the medical testimony as to the cause of death. The only person upon whom suspicion glanced was La Houssaye, and that in a vague and indistinct manner. Still, it was necessary to find him without delay, and Mr White at once sought him at his lodgings, of which Mademoiselle de Tourville furnished the address. He had left the house suddenly with all his luggage early in the morning, and our efforts to trace him proved fruitless. In the meantime the *post-mortem* examination of the body had taken place, and a verdict of wilful murder against Eugénie de Tourville been unhesitatingly returned. She was soon afterwards committed to Newgate for trial.

The Old Bailey session was close at hand, and Arthur Rushton, though immediate danger was over, was still in too delicate and precarious a state to be informed of the true position of affairs when the final day of trial arrived. The case had excited little public attention. It was not the fashion in those days to exaggerate the details of crime, and, especially before trial, give the wings of the morning to every fact or fiction that rumour with her busy tongue obscurely whispered. Twenty lines of the 'Times' would contain the published record of the commitment of Eugénie de Tourville for poisoning her mistress, Caroline Rushton; and, alas! spite of the crippled but earnest efforts of the eminent counsel we had retained, and the eloquent innocence of her appearance and demeanour, her conviction and condemnation to death without hope of mercy! My brain swam as the measured tones of the recorder, commanding the almost immediate and violent destruction of that beauteous master-piece of God, fell upon my ear; and had not Mr White, who saw how greatly I was affected, fairly dragged me out of court into the open air, I should have fainted. I scarcely remember how I got home—in a coach I believe; but face Rushton after that dreadful scene with a kindly-meant deception—*lie*—in my mouth, I could not, had a king's crown been the reward. I retired to my chamber, and on the plea of indisposition directed that I should on no account be disturbed. Night had fallen, and it was growing somewhat late, when I was startled out of the painful reverie in which I was still absorbed by the sudden pulling up of a furiously-driven coach, followed by a thundering summons at the door, similar to that which aroused me on the evening of Mrs Rushton's death. I seized my hat, rushed down stairs, and opened the door. It was Mr White!

'Well!—well?' I ejaculated.

'Quick—quick!' he exclaimed in reply. 'La Houssaye—he is found—has sent for us—quick! for life—life is on our speed!'

I was in the vehicle in an instant. In less than ten minutes we had reached our destination—a house in Duke Street, Manchester Square.

'He is still alive,' replied a young man in answer to Mr White's hurried inquiry. We rapidly ascended the stairs, and in the front apartment of the first floor beheld one of the saddest, mournfullest spectacles which the world can offer—a fine, athletic man, still in the bloom of natural health and vigour, and whose pale features, but for the tracings there of fierce, ungoverned passions, were strikingly handsome and intellectual, stretched by his own act upon the bed of death! It was La Houssaye! Two gentlemen were with him—one a surgeon, and the other evidently a clergyman, and, as I subsequently found, a magistrate, who had been sent for by the surgeon. A faint smile gleamed over the face of the dying man as we entered, and he motioned feebly to a sheet of paper, which, closely written upon,

was lying upon a table placed near the sofa upon which the unhappy suicide was reclining. Mr White snatched, and eagerly perused it. I could see by the vivid lighting up of his keen gray eye that it was, in his opinion, satisfactory and sufficient.

'This,' said Mr White, 'is your solemn deposition, knowing yourself to be dying?'

'Yes, yes,' murmured La Houssaye; 'the truth—the truth!'

'The declaration of a man,' said the clergyman with some asperity of tone, 'who defyingly, unrepentingly, rushes into the presence of his Creator, can be of little value!'

'Ha!' said the dying man, rousing himself by a strong effort; 'I repent—yes—yes—I repent! I believe—do you hear?—and repent—believe. Put that down,' he added, in tones momentarily feebler and more husky, as he pointed to the paper; 'put that down, or—or perhaps—Eu—génie—perhaps'—

As he spoke, the faint light that had momentarily kindled his glazing eye was suddenly quenched; he remained for perhaps half a minute raised on his elbow, and with his outstretched finger pointing towards the paper, gazing blindly upon vacancy. Then the arm dropped, and he fell back dead!

We escaped as quickly as we could from this fearful death-room, and I found that the deposition which Mr White brought away with him gave a full, detailed account, written in the French language, of the circumstances which led to the death of Mrs Rushton.

La Houssaye, finding that M. de Tourville had by some means discovered the secret of his previous marriage, and that consequently all hope of obtaining the hand of Eugénie, whom he loved with all the passion of his fiery nature, would be gone unless De Tourville could be prevented from communicating with his daughter, resolved to compass the old man's instant destruction. The chevalier persuaded himself that, as he should manage it, death would be attributed to the affection of the heart, from which M. de Tourville had so long suffered. He procured the distilled laurel-water—how and from whom was minutely explained—coloured, flavoured it to resemble as nearly as possible the cordial which he knew M. de Tourville—and he only—was in the habit of frequently taking. A precisely-similar bottle he also procured—the shop at which it was purchased was described—and when he called in King Street, he found no difficulty, in an unobserved moment, of substituting one bottle for the other. That containing the real cordial he was still in possession of, and it would be found in his valise. The unexpected arrival of Mademoiselle de Tourville frustrated his design, and he rushed in fury and dismay from the house. A few hours afterwards, he heard of the sudden death of M. de Tourville, and attributing it to his having taken a portion of the simulated cordial, he, La Houssaye, fearful of consequences, hastily and secretly changed his abode. He had subsequently kept silence till the conviction of Eugénie left him no other alternative, if he would not see her perish on the scaffold, than a full and unreserved confession. This done—Eugénie saved, but lost to him—he had nothing more to live for in the world, and should leave it.

This was the essence of the document; and all the parts of it which were capable of corroborative proof having been substantiated, a free pardon issued from the crown—the technical mode of quashing an unjust criminal verdict—and Mademoiselle de Tourville was restored to liberty.

She did not return to France. Something more perhaps than a year after the demonstration of her innocence, she was married to Arthur Rushton in the Sardinian Catholic Chapel, London, the bridegroom having by her influence been induced to embrace the faith of Rome. The establishments in Harley Street and Mayfair were broken up; and the newly-espoused pair settled in the county Galway, Ireland, where Mr Rushton made extensive landed purchases. They have

lived very happily a long life, have been blessed with a large and amiable family, and are now—for they are both yet alive—surrounded with grandchildren innumerable.

By Chas. Mackay, Esq.
LONDON SUNDAY TRADING.

ONE of the most startling spectacles to be met with in the great wilderness of London—because it is the one which comes upon the stranger most unexpectedly—is that of the Sunday Market. To the staid and sober inhabitant of a quiet country town, who has been accustomed from his youth upwards to see the Sabbath at least outwardly revered, the sight of one of these crowded places, the theatre of a vociferous and furious traffic on the morning of the day of rest, is generally revolting in the extreme. We had lately the curiosity to visit such a scene, with a view to forming some judgment as to what might be urged in its defence, and we shall now proceed to describe our impressions.

It is about eight o'clock in the morning of the second Sunday in April 1850, and we are standing at the junction of the Barbican with Chiswell Street, at the point where this line of thoroughfare is intersected by Whitecross Street, up which we have to proceed as far as Old Street Road, about a quarter of a mile, the whole extent of which is the arena of one of the most extensive markets in the metropolis.

Although the shutters of most of the shops, nearly five-sixths of which are devoted to Sunday-trading, have been down for nearly an hour, but little business has been done or is yet doing. The few customers who have already completed their purchases, and are hastening homewards, have an aspect of decency, almost of respectability; others of similar appearance are gliding about here and there, and transacting their business with all possible celerity; and it is tolerably plain to the observer that the use of the Sunday Market is not to them a matter of choice. These are probably persons who, not having received their weekly wages until a late hour, and being compelled by poverty to live from hand to mouth, have no other means of procuring their Sunday dinner than that which this market presents. It is obvious, from the expression of some countenances, that they feel the tyranny of circumstances which compels them to break in upon the time of rest. Let us at least give them due praise for the decent feeling which induces them to come at the earliest possible hour.

As we advance up the street, we see the shopkeepers busily engaged in displaying their goods to the best advantage for sale. Purchasers being as yet but few, opportunity is taken to make as good a show as possible against their arrival. We are astonished to find that the market is not confined to what might be considered by some a fair apology for it—the sale of necessary food. In addition to the shops of butchers, bakers, grocers, and provision dealers, not only are those of the slop and ready-made clothes' sellers wide open, but the linen-draper, hosiers, milliners, furniture-brokers, iron-mongers, and dealers in hardware and trinkets, are carefully setting out their windows and show-boards. Curriers and leather-sellers, moreover, have opened their doors, and are already doing a brisk trade, their shops being crowded with working shoemakers selecting the materials of their craft. Unless these poor fellows are actually at the present time working seven days in the week, it is difficult to conceive what should bring them in such multitudes to purchase their materials on the Sunday morning.

But an hour has passed away, and the street, now rapidly filling, presents a very different aspect from that which first struck our view. The shopkeepers have at length completed their arrangements, and now, standing at their open doors, and arrayed in aprons and shirt-sleeves, they begin with pretty general accord to bellow for custom. 'Buy, buy, buy!' explodes a brawny butcher; and the note is taken up by his neighbour,

and repeated by others in every direction a hundred times a minute, rapid and deafening as a running fire of musketry. It would appear as though this simultaneous appeal to the pockets of the public were a signal well known to the neighbourhood, for all the tributaries of Whitecross Street now pour forth their streams of hungry, meagre, and unwashed denizens to swell the inharmonious concert. The shrill shriek of infant hawkers pierces through the roaring din, and the diminutive grimy urchins are discerned manfully pushing their difficult way among the throng, bent upon the sale of certain trifling articles, upon the produce of which, in all probability, their chance of a supply of food for the day is dependent. 'Who'll buy my Congreves, three boxes a penny?' 'Blacking here! Here's your real Day and Martin, a ha'penny a skin!' 'Grid—grid—gridirons! Who wants a gridiron for three-halfpence?' 'Hingans—hingans here! Here's your hingans, a ha'penny the lot!' These cries, and a dozen others from a band of young urchins scattered among the multitude, form the squeaking treble of the discordant chorus that is raging on all sides. We discover as we pass slowly along that a pretty strong staff of policemen is present, perambulating continually among the mass of people, ready to disperse the first nucleus of a mob, or to quell by prompt interference the least appearance of a quarrel. It is plainly owing to their presence that the highway is passable at all, and that some degree of order is maintained amid the furious traffic that now goes on.

It is now drawing near to ten o'clock, and we are struck by the appearance and character of the present attendants upon the market as compared with those of an earlier hour. The males are for the most part the very lowest class of operatives, mingled with a still lower order of people, of whose probable occupation we would rather not hazard a surmise. We look in vain for a single one among them who has changed his working-day attire for a better suit; and the suspicion rises in the mind that nine-tenths of the whole tribe bear their entire wardrobe upon their backs. It is pretty plain that a good proportion of them have but recently been roused up from the heavy sleep of intoxication: half awake, and less than half sober, some crawl doggedly at the heels of their hapless wives in sullen silence, only broken at intervals by the involuntary ejaculation of an oath or a curse. Others, again, are altogether as noisy, and vie with the traders themselves in the loudness of their vociferations. Here one is chaffering for a pair of high-lows, and jokingly threatening to brain the shopkeeper with the heavy-armed heels unless he abate his price. There another plants heavy blows with his fist in the sides of an earthenware pan, by way of trying its metal, and, paying for it the price of a few halfpence, confides it to the charge of his ragged child, with a caution that he had better break his neck than let it fall. Here comes a couple who have completed their purchases for the day: the whole toilet of the man would not fetch sixpence at Rag-fair. Beneath a hat that should have scared the crows of a vanished generation, a shock of sandy unkempt locks shades a visage dark with dirt, darker still with the unmistakable traits of brutality; a huge brown overcoat, patched and stained in every part, indues his whole frame; his toes peep muddily forth from the fragments of what was once a pair of boots. In his bristly mouth is stuck a short and blackened pipe; both hands are firmly thrust into the side pockets of his coat; under his right arm is a loaf of bread, and under his left the half of a huge boar's head. Close behind him follows his wife, laden with a dilapidated basket, crammed with potatoes and withered turnip-tops yellow with age. Her figure is one shapeless bundle of worthless rags, stiff and nauseous with grease and defilement: bonnet she has none, but a piece of tattered muslin does duty as a cap, from beneath which her jet-black hair streams in disorder. Her pale and bloated cheeks show in fearful contrast with a horribly-contused

and livid black eye—the palpable handwriting of her loving lord. Her upper lip too has been recently gashed with a heavy blow. Panting with her burthen, and evidently displeased at some recent real or imaginary grievance, she is venting her wrath upon a miserable child whom she drags by her side, and whose hand she occasionally relinquishes for the purpose of making a sudden aim at his bare head with the street-door key which hangs upon her fore-finger; but the hapless little wretch is too well used to such endearments to be easily caught, and generally manages to parry the blow with his hands, or to elude it altogether.

We observe as we pass on that the gin-shops are now almost the only ones which are closed, and that the portion of the causeway upon which they abut, being free from the distractions of business, affords a space for loungers and gossips, who, having accomplished their purchases, love to while away an hour or two in conversation. Time goes on—and the bell of St Luke's Church, whose tall, ugly steeple, fashioned after the model of a factory chimney, looms dimly in the hazy atmosphere, tolls out to summon the worshippers to morning service. At the sound of the bell the shopkeepers step out and put up a shutter or two, leaving, however, light enough to carry on the traffic within. The trade in butchers' meat, vegetables, and other edibles, now sensibly decreases in amount, while at the same time it is despatched with greater rapidity. Parties late in the market are compelled to take what is to be had without the leisure or opportunity to exercise a choice. This is the very nick of time which the provident trader adopts to get rid of his old and worthless stock: it is said that many a tainted joint finds its way to the bakehouse, which, but for the tardiness of these lagging customers, had been made over to the dogs, or thrown away as useless; and full prices are obtained at the spur of the moment for viands that might have been purchased the night before at three-fourths of that amount.

Before the bells have ceased tolling, the thoroughfare has become tolerably passable for those who have no objection to rub shoulders occasionally with a perambulating joint of meat or basket of vegetables; but we remark that the very few persons who, living in this district, emerge from their dwellings, prayer-book in hand, bound for church, choose rather to escape from the main thoroughfare as soon as possible, and pick their devious way through by-lanes and back streets to the sacred edifice.

Now sets in the hebdomadal current of dish-laden individuals bound to the different bakers' shops, and carrying their Sunday's dinner with careful haste. It is amazing to note the number and variety of viands that dive consecutively into the darkened entrances; and one wonders how it comes to pass that each of the bearers manages to recover his own proper portion when the business of the oven is over. There are a prodigious number of them that appear, to an unpractised eye, so exactly alike, that the task of distinguishing them apart would seem hopeless to one unacquainted with the management of the mystery. A very favourite mode of insuring the variety of two courses at the expense of one baking prevails very extensively; it is managed in this way: the housewife provides a large earthenware dish, about twenty inches by fourteen, and three or four deep, having a division near the centre; the potatoes are crammed plentifully in the bottom of the larger compartment, and the modest joint rests upon them; the other division is appropriated to the pudding, in the manufacture of which we could perceive that a very considerable variety of talent had been displayed.

The bell has now ceased tolling, and the tumultuous uproar of the market subsides to a moderate murmur. Still the traffic is brisk and abundant in the interior of the shops. We remark those of the grocers and tea-dealers crammed to overflowing, and all the assistants behind the counter divested of their outer garments, and reeking with heat and hurry, weighing, measur-

ing, and packing with consummate despatch. The curriers, too, are dealing out soles and upper leathers, welts, wax, and paste, with a rapidity rarely equalled on a week-day, among the meagre and pallid crowd, who can scarcely find standing-room in front of the counter. The drapers' shops are swarming with customers of both sexes: caps, bonnets, shawls, handkerchiefs, and ribbons, change owners in a twinkling. Lads in fustian jackets are pulling about the many-coloured wares, resolved on treating their sweethearts with a morsel of finery; and smartly-dressed lasses are matching their pale faces with a strip of paler ribbon, or selecting a gaudy neck-tie for some favoured swain. The shoemakers and the marts for ready-made clothes have all a good share of encouragement, and do an amount of business in the Sunday forenoon, according to the candid confession of some of their proprietors, exceeding that of any two days in the week, Saturday excluded. This in-door traffic continues till past noon-day; and the shops are seldom finally closed before one o'clock, when the religious part of the community are returning from church. The appearance of the whole street, when the market is over, resembles very closely the deserted arena of a country fair, or Covent-Garden market after business-hours—the ground being one mash of mud and decaying vegetable matter.

We must not omit all mention of the species of literature which finds encouragement among the frequenters of the Sunday Market. Books we saw none, but good store of single sheets of all sizes, and varying in price from one halfpenny up to sixpence. All the Sunday newspapers are regularly placarded and sold; and in addition to them, there was an abundance of the blood-and-murder, ghost-and-goblin journals, embellished for the most part with melodramatic cuts, where what was wanting in truth of artistic delineation was plentifully made up in energy of action. It would seem that there is a charm in pistols, daggers, bludgeons, and deadly weapons of all sorts, with the assaults and assassinations they suggest, that is irresistible to the population of London. No matter how gross the ignorance or stupidity of a writer, so that he have but a deed of blood or violence to unfold: a murder is so delicious a morsel to the palates of a debased multitude, that it imparts a relish to the most intolerable dullness, and invests imbecility itself with the attributes of genius and talent.

The above, though necessarily brief, is, as far as we are aware, a truthful delineation of the Sunday Market. Of such localities, differing more or less in their primary features, there are five or six in the metropolis. When we take into account the demoralisation that must unavoidably accrue from the total neglect of religious duties which the continuance of this practice necessarily entails, we cannot but concur in the sentiments of those who are striving at the present moment to obtain by legal means the power of suppressing it. It is sad to learn, that though the great majority of the parties who gain most by this ill-favoured traffic are willing, nay, desirous, that it should be put an end to at once and for ever, it is yet, through the resistance of a petty minority, continued in their despite. Four-fifths of the Sunday-traders, we know from indisputable authority, would be willing to close their shops from Saturday night to Monday morning; but they are compelled in self-defence, in order to preserve their average custom, to open on the Sunday, because a few stubborn opponents persist in so doing. The evil is great in a physical as well as a moral point of view. Many of the shopmen in the district above-described, and in other places, as we have good reason to know, are confined behind the counter from seven or eight in the morning to ten at night the whole week through: to men so situated the relaxation of the Sunday is not merely a luxury, but a necessity; but from its enjoyment they are debarred by the continuance of a practice which cannot be spoken of without regret—and loss of health is the general consequence.

There has been no lack of legislation upon this subject; but it is a question whether legislative interference will effect much good. The law of Charles II., which would appear upon the face of it to be a good and efficient law for the purpose, has been found, in working, the next thing to a nullity. It levies a fine of five shillings upon the offender; but as the magistrates will not convict for more than one offence in one day, it is practically of no avail, as the profits upon one morning's business in some of the largest shops is from fifty to a hundred times that amount. Moreover, the trader can, and does, when he knows that informations are a-foot, reduce the five shillings to one shilling by taking out a summons against himself, which bars the issue of a second summons, and prevents the disgrace, as well as the expense of a hearing, as of course he does not appear to criminate himself.

We would not rashly impute the whole cause of Sunday trading to shopkeepers and hucksters. Not a little of the evil arises from a practise of paying weekly wages late on Saturday night; and to remedy this, every proper effort should be directed. Indeed, while such a practice prevails, all legislative interference on the subject would be worse than useless.

WHAT BECOMES OF ALL THE CLEVER CHILDREN?

DURING a visit to a friend in the country, I was enjoying a walk in his garden before breakfast on a delightful morning in June, when my attention was suddenly arrested by the pensive attitude of a little boy, the son of my host, whom I observed standing before a rose-bush, which he appeared to contemplate with much dissatisfaction. Children have always been to me a most interesting study; and yielding to a wish to discover what could have clouded the usually bright countenance of my little friend, I inquired what had attracted him to this particular rose-bush, which presented but a forlorn appearance when compared with its more blooming companions. He replied: 'This rose-bush is my own; papa gave it to me in spring, and promised that no one else should touch it. I have taken great pains with it; and as it was covered with beautiful roses last summer, I hoped to have had many fine bouquets from it; but all my care and watching have been useless: I see I shall not have one full-blown rose after all.'

'And yet,' said I, 'it appears to be as healthy as any other bush in the garden: tell me what you have done for it, as you say it has cost you so much pains?'

'After watching it for some time,' he replied, 'I discovered a very great number of small buds, but they were almost concealed by the leaves which grew so thickly; I therefore cleared away the greater part of these, and my little buds then looked very well. I now found, as I watched them, that though they grew larger every day, the green outside continued so hard, that I thought it impossible for the delicate rose-leaves to force their way out; I therefore picked them open; but the pale, shrivelled blossoms which I found within never improved, but died one after another. Yesterday morning I discovered one bud which the leaves had till then hidden from me, and which was actually streaked with the beautiful red of the flower confined in it; I carefully opened and loosened it, in the hope that the warm sun would help it to blow: my first thought this morning was of the pleasure I should have in gathering my one precious bud for mamma—but look at it now!'

The withered discoloured petals to which the child thus directed my eye did indeed present but a melancholy appearance, and I now understood the cause of the looks of disappointment which had at first attracted my attention. I explained to the zealous little gardener the mischief which he had unintentionally done by removing the leaves and calyx with which nature had covered and enclosed the flower until all its beauties should be ready for full development; and having pointed out to him some buds which had escaped his care, I left him

full of hope that, by waiting patiently for nature to accomplish her own work, he might yet have a bouquet of his own roses to present to his mother.

As I pursued my walk, it occurred to me that this childish incident suggested an answer to the question asked by Dr Johnson, 'What becomes of all the clever children?' Too often, it is to be feared, are the precious human buds sacrificed to the same mistaken zeal that led to the destruction of the roses which had been expected with so much pleasure by their little owner. Perhaps a few hints, suggested—not by fanciful theory, but by practical experience in the mental training of children—may help to rescue some little ones from the blighting influences to which they are too often exposed.

The laws by which the physical development of every infant, during the earliest period of its existence, is regulated, seem to afford a striking lesson by the analogy they bear to those laws on which the subsequent mental development depends; and by the wise arrangement of an ever-kind Providence, this lesson is made immediately to precede the period during which it should be carried into practice. On the babe's first entrance into the world, it must be fed only with food suitable to its delicate organs of digestion; on this depends its healthful growth, and likewise the gradual strengthening of those organs. Its senses must at first be acted upon very gently: too strong a light, or too loud a noise, may impair its sight or hearing for life.

The little limbs of a young infant must not be allowed to support the body before they have acquired firmness sufficient for that task, otherwise they will become deformed, and the whole system weakened; and last, not least, fresh and pure air must be constantly inhaled by the lungs, in order that they may supply vigour to the whole frame. All enlightened parents are acquainted with these laws of nature, and generally act on them; but when, owing to judicious management, their children emerge from babyhood in full enjoyment of all the animal organs, and with muscles and sinews growing firmer every day in consequence of the exercise which their little owners delight in giving them, is the same judicious management extended to the mind, of which the body, which has been so carefully nourished, is only the outer case? In too many cases it is not. Too often the tender mind is loaded with information which it has no power of assimilating, and which, consequently, cannot nourish it. The mental faculties, instead of being gradually exercised, are overwhelmed: parents who would check with displeasure the efforts of a nurse who should attempt to make their infant walk at too early a period, are ready eagerly to embrace any system of so-called education which offers to do the same violence to the intellect; forgetting that distortion of mind is at least as much to be dreaded as that of body, while the motives held out to encourage the little victims are not calculated to produce a moral atmosphere conducive either to good or great mental attainments. Children are sometimes met with—though few and far between—whose minds seem ready to drink in knowledge in whatever form or quantity it may be presented to them; and the testimony of Dr Combe, as well as of many other judicious writers, proves the real state of the brain in such cases, and also the general fate of the poor little prodigies. Such children, however, are not the subject of these observations, of which the object is to plead for those promising buds which are closely encased in their 'hard' but protecting covering; to plead for them especially at that period when the 'beautiful red streak' appears; in other words, when, amid the thoughtless sports and simple studies of childhood, the intellect begins to develop itself, and to seek nourishment from all that is presented to it. There exists at the period alluded to a readiness in comparison, and a shrewdness of observation, which might be profitably employed in the great work of education. And here it may be observed, that as to 'educate' signifies to *bring out*, the term *education* can only be applied

with propriety to a system which performs this work, and never to one which confines itself to laying on a surface-work of superficial information, unsupported by vigorous mental powers. Information may be acquired at any age, provided that the intellectual machinery has been kept in activity; whereas, if the latter has been allowed to rust and stiffen from disease, the efforts of the man—supposing him to have energy sufficient to make an effort—to redress the wrongs done to the boy, will in most cases be vain. That self-educated men are generally the best educated is a trite remark; so trite, indeed, that it frequently falls on the ear without rousing attention to the apparent paradox which it contains; and yet there must be some reason well worthy of attention for the fact, that so many who, in early life, have enjoyed advantages, have, on reaching manhood, found themselves surpassed by others who have been forced to struggle up unassisted, and in many cases surrounded by apparent obstacles to their rise. It is obvious that the point in which the latter have the advantage, is the necessity which they find for exercising their *own* intellectual powers at every step; and, moreover, for taking each step firmly before they attempt the next; which necessity, while it may retard the rapid skimming over various subjects which is sometimes effected, gives new vigour continually to the mind, and also leads to the habit of that 'industry and patient thought' to which the immortal Newton attributed all he had done; while at the same time a vivid pleasure is taken in the acquirement of knowledge so obtained beyond any that can be conferred by reward or encouragement from others.

From these considerations, it appears that the most judicious system of education is that in which the teacher rather directs the working of his pupil's mind than works for him; and it must be recollected that such a system, compared with some others, will be slow, though sure, in producing the desired result. Every one familiar with children must have observed with what apparently fresh interest they will listen to the same tale repeated again and again. Now, if time and repetition are necessary to impress on the young mind facts interesting in themselves, they are surely more necessary when the information to be imparted is in itself dry and uninteresting, as is the case with much which it is requisite for children to learn. The system here recommended is one which requires *patience* both on the part of parents and teachers; but patience so exercised would undoubtedly be rewarded by the results, one of which would be, that we should not so frequently see 'clever children' wane into very commonplace if not stupid men.

THE GIPSIES OF HUNGARY AND TRANSYLVANIA.

In all parts of Hungary and Transylvania are to be found the scattered members of a wide-spread family, called Gipsies in England, Bohemians in France, Gitanos in Italy, and in Hungary and Transylvania Tzigany, Tzigányok, and, by a decree of King Ladislaw in 1496, Pharaones, which corresponds with the name of Egyptians, bestowed upon them in some other countries. Most of the rivers of Transylvania and some of Hungary contain gold; but the most auriferous is that which rises in the western mountains of Transylvania, and falls into the Maros. It is called in Hungary the Aranyos; that is, the Golden. No one makes much of his gold-seeking in the rivers but the vagabond gipsy tribes, who love any easy trade. They get at the metal in different ways: some by throwing the water and sand continually upon a woollen stuff, which catches the gold; but generally by washing the sand in a cradle, a hollowed piece of wood, called *tehenyö*. The gipsies are active and clever at this trade: they seize the *tehenyö* by the two hands, shake it gently, let the water drip, catch up more water, and go on until the gold shines at the bottom. A few minutes will wash a

handful of sand. The gold-seeking gipsies are divided into twelve bands of eighty or a hundred each. Each band has a surveyor, who accounts with a director-general, who lives at Zalathna. They are exempt from public charges. These bands have no fixed place to work in; but each tzigany works by virtue of a permit wherever he thinks proper—now in one river, now in another, but generally in the Aranyos. In return, he must pay to the tax-gatherer every year a *pizéte* of gold, which is worth seven shillings and elevenpence. If he be active, he may make three *pizétes* every week—that is, about two-and-twenty shillings—which, in that part of the world, is high wages. During heavy rains, when the torrents bring fresh gold from the mountains, much more is obtained. They are required to sell the whole of their gold to the official surveyor, and the annual amount has never exceeded twenty-four lbs., or in value about L.1400 British. Of course, with capital and industrious workmen, very different results would take place; but the gipsies are idlers, who care only to make enough for the passing day. Some are so lazy, that in the whole year they do not earn the seven shillings due to government.

Their race is found in every part of Europe, and everywhere they seem to have the same habits and the same vices. Scattered over the whole continent, and amid divers populations, they, like the Jews, preserve a national character, remaining unaffected by the movements of society around them. In their own language they call themselves Romm. Many ethnographers have thought them of Egyptian origin; but more recent investigations appear to have traced them to India. 'Recently,' says Gerando, 'the missionary Wilson, passing through Pesth, thought that the gitanos of Hungary, like those of Turkey, speak a language which approaches that of the Budsurads on the shores of the Ganges.'

The Hungarian gipsies are true to their general character. As teasing as a gipsy, as great a boaster, as great a thief as a gipsy, are Hungarian proverbs. If a theft be committed, and gipsies be in the neighbourhood, they are at once accused—generally with justice. In the villages, they dwell apart from the peasants, who have a profound contempt for them; and they recognise the authority of one of their own people, named *vayvode*, or magistrate, as the lord of the locality. They bury themselves in mud huts, a few feet above the ground, into which they dig for greater space. A whole family dwells in this horrible den, from which the smoke escapes by a hole in the roof, while black and naked children play before the door. If a horseman passes, they run after him begging, and standing on their head. The mother and father come out, the dogs bark furiously, and the horse gallops away alarmed. The gitanos are sometimes nailmakers, farriers, and brickmakers; but they are always beggars.

The gitanos of Clausenburg, the capital of Transylvania, are numerous, and chiefly dwell, with droves of dogs as wild as themselves, in a savage outskirts. Both live in hollows of the rocks, in the low huts just described, and look like the denizens of the *Cour des Miracles* of Paris, or the *Alsatia* of London. But the gitanos of Clausenburg have an aristocracy, who reside at the other end of the town, occupying two hundred houses near the ramparts. These are chiefly musicians. They form very clever bands, and go about the country playing on the Communist principle. On their return, an equal division is made, and the share of one man is often from L.100 to L.200 English. These gitanos elect a *vayvode* every two years.

'I visited,' says Gerando, the best of recent writers on Hungary, 'the house of one of the rich gitanos of Clausenburg. The master, whose name was Mótí, was the ablest musician in the country. Warned of my visit, he received me with a violin under his arm. He led me with respectful dignity into his house, where I was received by his wife—a worthy housewife, who hid her copper-coloured face under the folds of a white handkerchief. His daughters, who had adopted scarlet-

striped kerchiefs, were pretty, but they disappeared. The house of Môtî was scrupulously clean. The first room contained household utensils, distaffs, and in a large earthen pot plenty of cream. Amid the decorations of the parlour was nothing reminding one of the vagabond; while I remarked with surprise a statue of Napoleon, and another of his son. The walls were covered with pewter plates that shone like silver; while a portrait of Môtî, mythological subjects, and religious pictures, also hung on the walls. Like all his companions, Môtî was a Roman Catholic, of which he was proud, being thus the co-religionist of the emperor of Austria.

This shows that the adoption of an industrious calling will civilise, from the noble who lives by rapine to the vagabond who exists by begging. Nothing can resist the effect of honest, laborious habits.

Most of the Hungarian gitanos are less settled. They wander about, careless of to-morrow, and without remorse for their peccadilloes. They are fortunately not numerous enough to be formidable. They encamp in the open air round a fire, with dogs, some pigs, and a lean horse. If they know a trade, they work at it a while in the villages as they pass. They are blacksmiths or basket-makers, and were once fortune-tellers; but this branch of trade is falling off. They pay no taxes—the government knowing no more of them than they know of the wolves in the forests. They are generally poor, or seem so; but some have amassed riches, and bury jewels and gold in the earth beneath a tree; for as habits of industry have not taught them the wants of civilisation, they have no use for this wealth.

A traveller once saw a gitano beating on an anvil near the road. He got out of his carriage, and approached him. 'What are you making?' said the traveller. 'Nails,' replied the tzigany. 'You are not clever,' continued the stranger, 'and your nails are worth nothing. Could you make a horse-shoe nail?' The gitano showed him one. 'That is no better: look at me.' In a few minutes the stranger showed him two nails of his fashion. The gitano opened his eyes and said, '*Bine invetiati*, you are very well taught!' The stranger was Prince Lobkowitz, president of the General Chamber of Vienna, and surveyor-general of all the mines of the empire.

The wandering habits of the gitanos are not easily cured. The Emperor Joseph II. tried to attach them to the soil. Their very language was to be abolished, and they were called 'the new peasants.' But all in vain. The gitanos took care to behave so badly on the land allotted to them, and from which they dared not move without leave, that they were driven away. They had commodious houses; but they put their cows in them, and lived in a tent beside them. The children apprenticed to farmers ran away. In 1782 there were in all Hungary only 77 sessions cultivated by the gitanos, and they paid altogether only 20,000 florins of taxes. Besides those who were labourers, there were 43,787 gitanos, of whom 5886 called themselves farriers, and 1582 musicians. The number has decreased since, and they would probably be extinguished but for new arrivals from Moldavia and Wallachia. In the sixteenth century the gitanos were driven from several states of Europe. Hungary and Transylvania were more hospitable; and in the archives of the ancient Diets many articles concerning them are found.

Their taste for wandering is supported by their ability to suffer privations and fatigue. They wear the same rags during the extreme heat of summer and the bitter blasts of winter; and when others are crossing a river in a sledge, they are seen walking barefoot, with some tattered rags scarcely covering their forms. But, as above remarked, all are not so miserable. There are some who follow agricultural pursuits in that part of Transylvania called *Mezőség* who are reckoned clever reapers. Like those of Clausenburg, the Hermannstadt gipsies are well off, and enjoy life. They wear the costume of rich Hungarian peasants, choosing

in preference lively colours. Their scarlet waistcoats are covered by little round, shining copper buttons, and heavy spurs sound at their heels. The women more especially feel the effect of this wellbeing. The copper-coloured complexion gives way to a peculiar white which shows off their deep black eyes. They seem to be of two races; some having curly hair, thick lips, and copper complexions; while others are olive-coloured, with more regular features, and smooth hair. But no matter what their dress, the young gipsies are remarkable for their elegant figures.

As for their religion, when they have any, it is that of their nearest neighbours: they are Roman Catholics, or of the Greek church, or Protestants, just as it happens; but they generally choose the religion of their lord, which, according to their aristocratic ideas, must be the best. A like notion makes them select the same original country as the Hungarians. 'Our fathers came from Egypt with Arpad,'* said a gipsy one day who was learned in history. The language of the race has of course become much corrupted. A Hungarian officer taken prisoner under Napoleon, and brought to France, declared that the gipsies of Hungary could not understand those of France. Even in Hungary and Transylvania their dialect has been modified by locality; the gipsies learning the language of the place they live in, and adopting particular words.

Dancing and music are the favourite delights of the gitanos. 'Maitre Môtî,' says Gerando, 'introduced me one day to two Bohemian girls. The tallest and oldest had thick lips, fiery eyes, and an African face. She wore a dark robe; a dark shawl with flowers was wrapped round her, and a long black handkerchief shaded her face. The other wore a hussar's jacket of black velvet, a spotted petticoat, and little boots. Her hair, black as jet, was partly concealed by a gauze veil, and framing the face, brought out the whiteness of her skin. She had the melancholy beauty of most of the women of her race not degraded by misery. As soon as Môtî had preluded, they began to dance. Their gestures and steps were slow. They held each other's hands; they parted, walking one towards the other, holding out their arms, and making their veils wave, then joining again to execute some expressive movements. Môtî put down his instrument; and they accompanied their dances themselves, singing to slow time a tune of great softness and melancholy, which expressed alternately tenderness and repentance, the ringing voice of the one or the grave notes of the other being uppermost according to the sense of the words.'

The gitanos are quick and clever when they choose to exert themselves; but it is chiefly in music they excel. 'Guided only by their ears,' says Schwartzner, 'and a little practice, they attain a quickness and vigour of execution which the best masters fail to gain. They are selected in preference for table music, festivities, marriages, and other occasions when people give way to gaiety.' They rarely know a note of music, but their musical genius makes up for their ignorance, and none but the gipsies can play well the Hungarian national songs. Hungarian music is full of depth and passion. Full, solemn, and sometimes sad, it requires calm and ardent performers, who can allow the national vivacity to gleam through even the most melancholy passages. This vivacity bursts forth in rapid and animated flights, which awake enthusiasm, and show off in high relief the bold, brilliant, and hardy Hungarian character. The genius of the gitanos makes them play and sing these airs with incomparable success, not only correctly in themselves, but with variations improvised on the spot. Of course this refers to the very best artists; but if you

* Arpad was the celebrated khan of the Hungarians, who, when driven with his tribes from the banks of the Volga, towards the end of the ninth century, settled on the Theiss, and, as the ally of the Emperor Arnoul, beat the Moravians in the year 895. He gave his name to a Hungarian dynasty, which began with St Stephen in 997, and which kept the throne till the death of Andrew III. in 1301. This race of kings is known as the Arpades.

put a violin into the hand of a child, he will soon play as well as his father. Thus in every village the gipsies are the minstrels, and take the lead on every festive occasion. Besides, they alone preserve the vast number of unwritten airs which are the music of the land. When travellers stop at an inn, they are sure to come under the window and play; and one of them at Bethlen attained of late years great celebrity, especially for the seditious air of 'Rákóczy.' They one day took it into their heads to play it under the windows of the Archduke Ferdinand d'Este when sent to watch the Transylvanians after a violent dissolution of their parliament. The Archduke drove them away.

Impudence and cunning are the hereditary qualities of gipsies, but the impudence of musical gipsies is excessive, a trait of character which they share with many other artists in the same line. Perhaps they are proud of their genius, and presume on it; but they are on occasion strangely familiar with the proud lords of Hungary. One day a tattered gipsy, with a violin under his arm, entered a saloon where sat in conversation two gentlemen, he being totally unannounced. He asked coolly if a concert would be agreeable, and was answered in the negative. 'Another time,' said the gipsy, and off he walked. A clever violinist of the tribe once played before a musical lord; and when he had concluded, and had been loudly applauded for his exquisite skill, he handed his violin to the nobleman, counting on shining still more by contrast. The magnate quietly took the instrument, and the gipsy was not a little mortified to find that he played as well as himself.

Ragged, vagabond, careless, confident, proud, and happy, he wanders about with his violin under his arm. Employed or unemployed, he is always the same. If asked to play, he is ever ready, and will execute anything, 'grave or gay, lively or severe,' under the scorching sun or in the pelting snow. Such is the Hungarian gipsy, child of a race which is gradually fading from the earth, and which can only be saved from extinction by losing its nomadic character and adopting the sedentary habits of civilisation.

CUVIER AND THE SWALLOWS.

In his later years the celebrated Cuvier loved to recount, the incident which first turned his attention to the study of natural history. While young, and in want, he was engaged as tutor to the children of the Count de Héricy, and with his pupils inhabited an old château in the Pays de Caus at Fiquainville. Cuvier's room looked towards the garden, and early each morning he was accustomed to open his window and breathe the fresh air before commencing the instruction of his somewhat undisciplined pupils. One morning he remarked two swallows building a nest in the outer angle of his small casement. The male bird brought moist clay in his beak, which the hen, as it were, kneaded together, and, with the addition of straws and bits of hay, formed their future home. Once the framework was completed, both birds hastened to line the interior with feathers, wool, and dried leaves; and then taking flight together into a neighbouring wood, they did not return to their nest until after the lapse of several days. Meantime some important events had happened. While the two swallows were so busily employed in constructing their home, Cuvier had remarked two sparrows perched on a neighbouring chimney, who seemed to watch the progress of affairs with much curiosity. The treacherous object of this surveillance speedily became apparent; for no sooner had the poor swallows left the coast clear, than the pair of sparrows took possession of the nest, and established themselves in it as comfortably as though it had been their own property. Cuvier remarked that they never absented themselves together from the nest; one always remained on the watch, with its sturdy bill protruded through the entrance, prepared to exclude every visitor except its mate.

At the end of the honeymoon the rightful owners returned. What was their surprise to find their nest pre-occupied! The cock flew indignantly against his dwelling, to expel the intruders, but was met by the formidable beak of the male sparrow, which quickly repulsed the unlucky proprietor with a bleeding head and ruffled feathers. Trembling with rage and shame, and his bright eye darting fire, he returned to his bride, perched on a green bough, and seemed for some moments to hold an anxious colloquy with her. Then they took flight together, and soon disappeared.

Presently the hen-sparrow returned, and her husband began, as Cuvier conjectured, to give her an animated account of his adventure, accompanying the recital with certain curious little cries, which might well pass for derisive laughter. Be that as it may, the prudent pair did not waste much time in chattering, but hastened out in turns to collect and store up a quantity of provisions. This accomplished, they both remained within, and now two stout beaks were placed ready to defend the entrance. Cries resounded in the air; crowds of swallows began to assemble on the roof. Cuvier recognised in the midst of them the expelled householders making their wrongs known to each fresh arrival.

Ere long, there were assembled in full conclave upwards of two hundred swallows. While they were chattering in a style that fully rivalled the performances of many speakers in more ambitious and celebrated meetings, a cry of distress was heard from one of the windowsills. A young swallow, tired no doubt of the long parliamentary debate, had betaken himself to the pursuit of some flies who were buzzing about the window. Cuvier's pupils had placed a snare on the sill, and the poor little bird found one of his slender legs entangled by the cruel horse-hair.

At the cry of the captive, about twenty of his brethren flew towards him, and tried to set him free; but in vain. Each effort only served to tighten his bonds, and so increase his pain. Suddenly the swallows, as if with one consent, took flight, and wheeling in the air, came one by one and gave a sharp peck at the snare, which, after repeated pulls, snapped in two, and the freed bird flew joyously away with his kind companions. During this scene, which passed within a few yards of Cuvier, and at about the same distance as the usurped nest, the tutor remained motionless, and the two sparrows never once stirred their threatening protruded beaks.

Suddenly, and swift as thought, flew a host of swallows against the nest: each had his bill filled with mud, which he discharged against the entrance, and then gave place to another, who repeated the same manoeuvre. This they managed to accomplish while two inches distant from the nest, so as to keep out of reach of the beleaguered sparrows. Indeed the latter were so effectually blinded by the first discharge of mud, that they no longer thought of defending themselves. Meantime the swallows continued to heap mud on the nest, until it was completely covered: the opening would have been quite choked up but for the desperate efforts made by the sparrows, who by several convulsive shocks contrived to shake off some of the pellets. But a detachment of the implacable swallows perched on the nest, and with their beaks and claws smoothed and pressed down the tough clay over the opening, and at length succeeded in closing it hermetically. Then were heard from hundreds of little throats cries of vengeance and of victory!

But the swallows did not end their work here. They hastened to bring from all directions materials for a second nest, which they constructed over the blocked-up entrance of the first one; and in two hours after the execution of the sparrows, the new nest was inhabited by the ejected swallows.

The inexorable vengeance was now completed. Not only were the unfortunate sparrows doomed to expiate their crime by a lingering death, but they were forced during their torments to listen to the joyful song of the two swallows, the cause of their execution. During

many days the hen rarely quitted the nest; she had laid six eggs, and while she was hatching them, her mate supplied her with insects for food. At the end of a fortnight Cuvier remarked that the cock was busy all day in bringing an enormous quantity of insects to his household; and looking into the nest, he saw six little yellow bills all gaping wide for food. From that time it became a constant source of pleasure to the tutor to watch the progressive development of the little family. Their yellow beaks became black and shining, their downy bodies were covered with smooth and elegant plumage, and they began to accompany their mother in her short excursions from the nest. The cock taught his children how to seize their prey in the air; how to fly high when the atmosphere was calm, and the flies disported themselves in the upper regions; and how to keep near the ground when a storm was approaching; for then all insects seek a shelter.

Thus passed the summer, and autumn came. Crowds of swallows once more assembled on the roof of the Château de Fiquainville. They held regular conversations, and Cuvier amused himself with trying to interpret their language. The children of the nest were placed in the midst of the troop with the other young swallows; and one morning the whole assembly took flight simultaneously, and directed their course towards the east. In the following spring two swallows, lean, and with ruffled feathers, came and took possession of the nest. Cuvier immediately recognised them: they were the identical birds whom he had watched with so much interest during the preceding year. They began to repair their dwelling, and to stop the chinks produced by the winter's frost; they relined the interior with soft-dried moss and feathers, and then, as in the previous season, set out for an excursion.

The morning after their return, as they were gaily pursuing their prey close to Cuvier's window, for they were now quite tame, and accustomed to his presence, a hawk that was soaring in the air pounced suddenly on the cock. He struck him with his talons, and was bearing him off, when Cuvier fired at him with a fowling-piece, which happened luckily to be at hand. The brigand fell into the garden mortally wounded, and Cuvier hastened to relieve his poor little friend. The swallow was seriously wounded; the hawk's talons had deeply pierced his sides, and a grain or two of shot had grazed his breast, and broken one wing. The kind young man dressed the wounds with all possible care and tenderness, and then, with the assistance of a ladder, replaced him in his nest, while the poor hen fluttered sadly round her mate, uttering piercing cries of distress. During three days she only quitted the nest to seek for insects, which she brought to the cock. Cuvier watched his poor little languishing head feebly raised to take the offered food, but each day his strength visibly declined. At length early one morning Cuvier was awakened by the cries of the hen, who was beating her wings against the window: he ran to the nest. Alas, it only contained a lifeless body! From that moment the hen drooped and pined away. She never left the nest, refused the food which Cuvier constantly offered her, and, literally broken-hearted, expired five days after the death of her beloved companion.

This little history left a strong impression on the amiable and gifted mind of the young tutor. It led him to devote his leisure hours to the persevering study of natural history; and many months afterwards he related the anecdote to the Abbé Tessier, who was paying a visit at the château. Revolutionary persecution had obliged this distinguished man to take refuge in Normandy, and accept the situation of physician to the hospital of Fécamp. Struck with the evident talent of Cuvier, he engaged him to deliver a course of lectures on natural history to the pupils attending his hospital; and wrote to introduce him to the notice of Jussieu and Geoffroy-Saint-Hilaire. Cuvier entered into correspondence with these and with other scientific men; and after some time passed in profound study, he was

appointed to fill the chair of comparative anatomy at Paris. The remainder of his glorious career is matter of history.

MR MORRIES STIRLING'S NEW METALLIC MIXTURES.

THERE are few things more remarkable than the total change of properties produced when two or more metals are made to combine together so as to form what are called alloys. This change is so marked, that it is often impossible to predict, from the known properties of the component metals, those of the alloy. We see this very distinctly in the long-known cases of brass, an alloy of copper and zinc, in all its varieties; of bronze, bell-metal, gun-metal, and gong-metal, which are alloys of copper and tin; of type-metal, a mixture of lead, antimony, and tin; and many others.

But although many useful and valuable alloys are known, when we consider the great number of simple metals—of which nearly fifty have been discovered, while at least twenty are sufficiently abundant to be applied to practical purposes; and further, that any two metals may combine in many different proportions; and lastly, that very often an exceedingly small proportion of one metal will give to another entirely new properties—when we consider these things, it is obvious that the existing alloys can form only a very small proportion of the immense number that may be obtained, many of which may probably turn out more valuable than any yet known.

Mr Morris Stirling, a gentleman thoroughly qualified for the task by a scientific education and long practical familiarity with chemistry, has, within these few years, paid much attention to the alloys, chiefly of the most important of all metals—iron. The results he has obtained are of the highest practical importance, and afford a signal proof of the truth of what we have stated—namely, that multitudes of valuable alloys remain to be discovered, and will richly reward the time and labour bestowed in such investigations.

The reader is probably aware that the best hammered or malleable iron is nearly pure iron, and that cast-iron and steel are compounds—alloys they may almost be called—of iron with small proportions of carbon or charcoal. Cast-iron contains more carbon than steel, although in both the quantity is small, varying perhaps from $\frac{1}{4}$ or $\frac{1}{2}$ to 4 or 5 per cent. Cast-iron is fusible, hard, brittle, unelastic. Steel is also fusible and hard, but it is much tougher, and highly elastic. Here we see the powerful effects of so small a proportion of carbon; for iron is nearly infusible, soft, and very tough, when free from carbon.

Now Mr Stirling has found that cast-iron may be rendered very tough, without losing its fusibility, by simply alloying it with a certain proportion of wrought or malleable iron. He takes, we shall say, a quantity of any species of cast-iron—no matter for the general character of the result of what kind—and has it run from the blast-furnace into moulds containing a certain proportion of scrap-iron. The pigs thus formed are then melted, as usual, in a cupola, and run into the desired moulds for castings. Thus is produced what he calls his *toughened cast-iron*. His object, in the first experiments, was to improve the inferior, weaker, or more fluid irons to an equality with the better kinds; but he did not expect the remarkable result actually obtained—namely, that all irons are thus brought to a kind of average strength and toughness *far above that of the best cast-iron*. The strength of cast-iron is measured by the weight necessary to break a bar 1 square inch in section, and 4 feet 6 inches long between the supports, when suspended to the middle of the bar. The highest result obtained by Mr Hodgkinson with the best (Blaenavon) cast-iron was 578 lbs.; but the average, as given by the same authority, is 454 lbs.

Now Mr Stirling has obtained the very high result of 868 lbs.; while Mr Rennie, using Mr Stirling's method, obtained that of above 900 lbs. Later experiments have given a still higher degree of improvement; so that the maximum increase of strength over that of average cast-iron (454 lbs.) is 120 per cent.; and that which may on all occasions be calculated on is from 60 to 70 per cent., yielding an average of about 750 lbs. as the breaking weight of an inch bar 4 feet 6 inches between supports. All sorts of cast-iron, if the due proportion of wrought scrap for each be ascertained, may be brought to this very high average of strength. Of course the improvement is, relatively to the

original quality of the iron, not so great in the best as in the inferior sorts, but even in the best it is very great. This method is not a source of increased cost, for the cost is only greater in reference to the iron used. Thus Scotch pig-iron, at L.2, 10s. per ton, when the expense of the scrap-iron, besides the royalty of the patentee, is added to it, costs, as toughened cast-iron, about L.3 per ton. But it is now 60 per cent. stronger than iron sold at L.3, 15s. and L.4 per ton.

It is not easy to estimate the importance of this discovery, which has been confirmed by many of the leading iron masters, who are now using the patent under Mr Stirling's license. For all castings where strength is required, such as beams, girders, pillars, the advantage is so great and obvious, that it is hardly necessary to do more than allude to it. We obtain, at a cheaper rate, with the same weight of casting, nearly double the strength, which, for railway bridges, &c. is an invaluable result. But further, where the actual strength is more than sufficient to resist the strain to which it is exposed, we can attain that strength by using a much less weight of metal, and consequently at a still further reduced price.

Mr Stirling has produced an admirable alloy of iron, intended as a substitute for that of copper used for bells. It is, even under the patent, one-third cheaper than ordinary bell-metal, exceedingly hard, and not more brittle. It is wonderfully sonorous, and the tone of bells made of it (of which the writer possesses two) is superior to that of any bells of the same pitch we have ever heard. It is rich, full, musical, and pure, and singularly prolonged. Messrs Mears, the great London bell-founders, have taken a license for this alloy.

The same metals, in a different proportion, yield an alloy which takes a remarkably high polish and silvery lustre, and will probably be found advantageous for speculum metal.

There is another alloy of iron with one or more of the metals above-mentioned in certain proportions, designed for gun-metal. It is made of different qualities, according to the purpose for which it is intended. The tensile strength of two of the kinds was compared with that of gun-metal made at Woolwich. The metals were cast and tried under similar circumstances. Of the Woolwich gun-metal, the average of many sorts was 11 tons per square inch; while that of Mr Stirling's gun-metals was 16 tons per square inch.

With zinc for a basis, Mr Stirling has made many alloys of admirable properties. One, with an adjunct of copper, makes excellent bell-metal. Another, with manganese besides copper, produces one having many of the qualities of gold. A third, with nickel and copper, furnishes a metal resembling silver. The second of these is found highly suitable for metal pens.

It is gratifying to consider these discoveries as the result of diligent application to experiment, and to learn that the merits of the discoverer are likely to be duly rewarded. We find that his improved irons have obtained the approbation of the government commissioners for investigating the properties of iron for railway purposes.

PUNS.

I have mentioned puns. They are, I believe, what I have denominated them—the wit of words. They are exactly the same to words which wit is to ideas, and consist in the sudden discovery of relations in language. A pun, to be perfect in its kind, should contain two distinct meanings: the one common and obvious, the other more remote; and in the notice which the mind takes of the relation between these two sets of words, and in the surprise which that relation excites, the pleasure of a pun consists. Miss Hamilton, in her book on Education, mentions the instance of a boy so very neglectful that he could never be brought to read the word *patriarchs*; but whenever he met with it he always pronounced it *partridges*. A friend of the writer observed to her that it could hardly be considered as a mere piece of negligence, for it appeared to him that the boy, in calling them partridges, was *making game* of the patriarchs. Now here are two distinct meanings contained in the same phrase: for to make game of the patriarchs is to laugh at them; or to make game of them is, by a very extravagant and laughable sort of ignorance of words, to rank them among pheasants, partridges, and other such delicacies, which the law takes under its protection, and calls *game*: and the whole pleasure derived from this pun consists in

the sudden discovery that two such different meanings are referable to one form of expression. I have very little to say about puns; they are in very bad repute, and so they ought to be. The wit of language is so miserably inferior to the wit of ideas, that it is very deservedly driven out of good company. Sometimes, indeed, a pun makes its appearance which seems for a moment to redeem its species; but we must not be deceived by them: it is a radically bad race of wit. By unremitting persecution, it has been at last got under, and driven into cloisters—from whence it must never again be suffered to emerge into the light of the world.—*Rev. Sydney Smith.*

THE RIGHT LEG.

Having noticed that this limb was more frequently the seat of accidents than the left in the wards, I made the comparison accurately, at one time, of those in the house; and found that of sixteen simple and compound fractures and amputations of the leg or thigh, thirteen were in the right, and but three in the left limb. If a hypothesis were allowed, possibly the fact might be explained on the idea that it is, in this country, chiefly from recklessness and overhaste that accidents occur; the 'best foot forward' suffering the most injury.—*Dr Hartshorne, in American Journal of Med. Sciences.*

MY CHRISTIAN NAME.

My Christian name—my Christian name,
I never hear it now;
None have the right to utter it;
'Tis lost—I know not how:
My worldly name the world speaks loud—
Thank God for well-earned fame!—
But silence sits at my cold hearth—
I have no household name.
My Christian name—my Christian name,
It has an uncouth sound:
My mother chose it out of those
In Bible pages found:
Mother! whose accents made most sweet
What else I held in shame,
Dost thou yet whisper up in heaven
My poor, lost Christian name?
Brothers and sisters, mockers off
Of the quaint name I bore,
Would I could burst Death's gates to hear
Some call it out once more!
One speaks it still—in written lines—
The last fraternal claim:
But the wide seas between us drown
Its sound—my Christian name!
I had a dream for years. One voice
Might breathe this homely word
As love breathes: I had swooned with joy
Had I my name thus heard.
Oh, dumb, dumb lips! Oh crushed, crushed heart!
Oh grief, past pride, past shame!
To die—to die, and never hear
Thee speak my Christian name!
God send thee bliss!—God send me rest!
If thou with footsteps calm
Shouldst trace my bleeding feet, God make
To thee each blood-drop—balm.
Peace to these pangs! Mother! put forth
Thine elder, holier claim;
And the first word I hear in heaven
May be—my Christian name!

PHILOSOPHY OF THE ITALIAN OPERA.

THERE is hardly a subject which affords more matter of wonder to the great body of the middle and lower classes of England than the popularity, so lengthened, so firmly rooted, and so little liable to be affected by revolutions in taste and schools of art, which the Italian Opera maintains for itself amid the comparatively limited circle of its constant frequenters. That England has of late years become, if not emphatically a musical nation, at least a much more musical nation than it was, is nothing to the purpose. Long before the era of cheap concerts and music for the million, the Italian Opera stood as firmly upon its throne as now, and many a hard word its frequenters and it had to bear from that sturdy tribe of middle-class John Bulls, who would never cease from expressing their indignant and patriotic wonder that English men and women could be found to support the squalling of a parcel of Italian singers in preference to the good old legitimate drama of the land. And to some extent the same species of cant is kept up still. 'People don't go to the Opera for the music—what do nine-tenths of pit and boxes know or care about it? While as for the language—how many who pretend to be in ecstasy at a song, understand one word of the tongue which it is sung in? No, no; people go to the Italian Opera neither for the words nor the music, but just because it's fashionable; and that's all about it.'

We put it to our readers whether this is not a fair expression of very generally-entertained notions; perhaps, indeed, these pages may be perused by many who themselves hold the opinion indicated. To all such we would now address ourselves, in the hope of clearing away a very prevalent misconception by explaining what, strange as it may seem, is, to the great body of even the play-going public, a mystery—what are the less ostensible and secret, as well as the declared and avowed attractions of the Opera. Take, for example, an intelligent man, moving, it may be, in commercial or professional society, and going to the Opera once or twice in a season: why, he can know nothing of a species of social pleasure which, unfelt and even invisible to him—so quiet and little noticeable are its demonstrations—is yet reigning gaily around him. The music and the spectacle he shares in common with thousands of others, but he is still perfectly unaware that, apart from, yet not altogether unconnected with, the show upon the stage, there is to the initiated in these mysteries a peculiar charm in the moral atmosphere of the place, in which lurks the true and subtle and enduring essence of the popularity of the Opera. What that charm is we shall endeavour to indicate.

The popular dictum that people go to the Italian Opera without understanding or seeking to understand

or appreciate a note of the music, contains, like many other popular dicta, a grain of truth to a bushel of falsehood. A man may begin to haunt the Opera for other than musical pleasure—as, for instance, to see the dancing and pirouetting in the ballet; but if he possesses within him the slightest germ of taste for the beautiful in sound, that germ insensibly begins to bud and blossom. Unknown to himself, he undergoes an apprenticeship to that service of sweet sounds 'which give delight, and hurt not;' and by dint of constantly hearing the finest music in the world interpreted by the most gifted artists, he slowly, but surely, acquires a taste—generally speaking a correct one—and without understanding scientifically the construction of a single movement of the compositions which gradually steal upon his soul, and by their very loveliness breed and nurture new faculties within him, he finds himself, he hardly knows how, converted, not indeed into a very profound connoisseur, nor into a very rapturous musical enthusiast, but still into a quiet, gentlemanly amateur, with a taste formed upon the best models, and an appreciation which acts, as it appears to him, less by understanding than by a species of slowly-acquired and developed instinct. Such we take to be the musical condition of the greater portion of Opera *habitues*, springing, the reader will observe, not from any peculiar musical aptitude, but from the long habit of hearing excellent music excellently performed. There are of course numerous exceptions to the class which we have described: ladies and gentlemen who, beginning with more than the average degree of musical appreciation, think more of what passes upon the stage and in the orchestra than around them, and the converse order, who, commencing their Opera career with a musical sensibility beneath the average, continue to be more influenced by the social than the musical pleasures of the lyric theatres. As a general rule, however, we repeat that the London operatic public forms a good-natured but perfectly discerning and competent tribunal upon the art questions which are laid before it. Educated by better *artistes* than the operatic publics of Vienna and Berlin, and less apt to be carried off their legs than the volatile and easily-stirred public of the Salle Favart at Paris, there is not a lyric artist between Messina and Prague who does not look upon a London engagement as one of the great prizes of his profession, and who does not face a London public with a nervousness of which he would have felt little in Germany, Italy, or France.

But, all this admitted, the question still remains—why do people of the higher classes in London choose to go through that novitiate which makes them the competent judges which we believe them to be? The superficial reply will be with ninety-nine people out of the hundred, because the Opera is fashionable. Now a thing may be fashionable for a season without any very sen-

sible cause: but nothing is fashionable for a century unless there exist some very good reasons for it.

In one important respect the Opera, in its rules and observances, and indeed its very nature, differs from all other places of public amusement whatever. It is a place to which people every night resort with different reasons, and from different views. If a man goes to a theatre, he is understood to go to see and hear the play; and theatres are arranged and their rules settled accordingly. So, if a man pays his money at the door of a lecture-room, or an exhibition-room, or a concert-room, he finds everything arranged so as to facilitate the ostensible purpose of his coming, and that ostensible purpose only. With the Opera this is not the case. The casual visitor arrives early, rushes jostlingly along the passages to his place, and sits there, just as he would do in Drury Lane or the Lyceum. Not so the habitué—and he it remembered an Opera is supported in by far the greatest degree by habitués—who pays not for any single night's entertainment, but for the constant run of the house. He never seeks to rush in pell-mell with the first eager group of kickers at the outside door: his place is comfortably secured for him; or, if he chance to have none in particular, he knows that a score of friends can accommodate him; or perhaps he never intends to sit down at all. He goes to the Opera for a musical and social lounge; to see and be seen; to talk and be talked to; to wander from box to box; to pay his respects to one family in the grand tier; to hear the news of Mrs So-and-so's party in the first tier; to inquire about the pic-nic which is fixed for next Wednesday at a sure source in the second tier; to learn the latest political or social chit-chat as it flies about the lobbies, or to become informed of the tittle-tattle of the *coulisses*—how the new opera 'goes' at rehearsal; how the management quarrelled with Madame So-and-so, and how she could not be induced to sing until half an hour before the rising of the curtain; how Mario is to be especially great in the *aria* of the first act; and how Grisi will 'be safe' to make a real *furor* in the delicious cabaletta of her cavatina in the second. Let us not here be misunderstood. The music is not suffered to pass unheeded during the continuance of all these shreds and fragments of gossip talk. A degree of modified attention is bestowed even upon the more level and uninteresting passages; and as soon as one of the 'points' of the evening arrives—the *aria* or the chorus—there is not a sound from all the vast *encinte* intervening for an instant between listening ears and the sparkling tide of music.

It is thus, then, as a delightful evening lounge—as a place where one is pretty sure of meeting with scores of acquaintances—as a sort of social 'Change, performing, indeed, to some small extent the functions of a club, and improving upon these functions, inasmuch as it admits of the presence of ladies—that the Opera fulfils its mission and maintains its popularity. The music is a fundamental, but not the absorbing feature of the entertainment. It is possible to hear, ay, and to enjoy music, even while a low-toned conversation is being kept gaily up. It has its sensuous as well as its purely intellectual delight. To relish a play, especially a play pretending either to elevated poetry or keen wit, individual attention is requisite. Once or twice heard, however, the interest palls, and the intellectual pleasure abates. Not so in music: the most scientific and intelligent judges are always shy of pronouncing any decided opinion upon an elaborate operatic work after a single hearing. And so far as the more general public

goes, it is only after many repetitions that the intellectual beauties of the music become manifest; while the sensuous pleasure produced by rich harmony and graceful melody prevents these repetitions from becoming tiresome or monotonous. The reader will then perceive how well fitted music, as played in great operatic establishments, is to lay the foundation of a half-sensuous, half-intellectual gratification, upon which a pile of independent social pleasure is erected.

So much, then, being premised, let it be remarked how admirably fitted for all the purposes in view are the construction and regulations of the Opera. A great point to secure in a place of favourite social resort is perfect facility of communication; this theatres do not, and ought not, to afford: the Opera ought, and does. The whole house—excepting the galleries, which are not intended for the classes on whom the establishment more especially depends—is flung open for the free circulation to and fro of visitors. You call at a box precisely as you do at a house. You meet your friends in lobby and saloon precisely as you do in street or park. The whole tone and atmosphere of the place is less that of an exhibition where any one comes to see or hear, than that of a social neutral ground where persons moving in certain classes of society come naturally together, and mingle in easy and unrestrained intercourse. The art of conversation, Talleyrand said—not as he explained it, that of argument on the one hand, or mere puerile small-talk upon the other—was lost in France with the great Revolution. We doubt whether it ever flourished to any great extent in England; but there can be little doubt that the atmosphere of the Opera nurtures as fair specimens of pleasant conversational airiness as can be met with under the skies which bend over our island. In clubs the talk is apt to get cliquish and professional; at dinners to be noisy and over-hilarious; at evening parties to be conventional and puerile. At the Opera men of all classes meet on common ground—men of politics, men of law, men of science, men of literature, men of art, men of fashion. The conversation of the politicians, the savants, the authors, the artists, the dandies, each taken as a class, would probably be excessively technical or excessively inane; but mingled together, it becomes racy, amusing, and sparkling; and it is this sort of talk, this whirlpool of chat, gossip, information, and anecdote constantly buzzing and humming in lobby, and alley, and box, which, backed of course and supported by the music, gives that particular charm which the Opera habitué enjoys with such keen relish.

Let us, gentle reader, make the tour of the house together, and listen to what we can pick up. We lounge round the back of the pit, saunter through the little slice of Fops' Alley left to us; or, if we be at the Covent-Garden Opera, proceed on the fall of the drop-scene to the swarming passage behind the pit tiers of boxes. Here the habitué is surrounded by familiar faces—dandies, artists, journalists, *hommes des lettres*. Listen to the scores of rapid, animated conversations, or rather bits of conversations, working and fermenting all round:—

'Other house full to the doors: people standing all round the pit.' 'Odd fracas that at the So-and-so Club.' 'Ah! I'll tell you the true history of that affair.' 'Wasn't that an introduced aria in the third act?' 'To be sure—from the *Zauberflöte*.' 'So Peel said to-day: I had it from the best source.' 'What did you say was to be the name of Mr Such-a-one's new book?' 'Quite remarkable; what good voice he is in, and only arrived

from Milan in time for to-day's rehearsal!' 'So you see, if ministers can't whip in their men in time for the division——' 'Certainly Mario took that note bright—the high C: the *ut de poitrine*, which was Duprel's great point.' 'So, upon this, the duke wrote immediately to Madlle——' 'But I know positively that Meyerbeer has engaged to write a grand opera for the Académie.' 'Gone in his yacht to the Mediterranean.' 'Not a bit of it; the article was written by quite another person.' 'Brilliant bit of fore-shortening that certainly.' 'They do say at the clubs that the committee will make no report.' 'Seen So-and-so to-night?' 'Yes—left him at the French plays.' 'Grisi very good in the last act.' 'Capital story of old Rogers.' 'Got back from Paris to-day: Garcia will be here.' 'Too high for his voice: Costa transposed it.' 'Quite different from Pasta's style.' 'Dozelli was the original.' 'You don't say so—eight black balls?' 'The old duke in his box.' 'New novel—undoubted hit.' 'Contralto no go.' 'Said so.' 'Admirable in the upper notes.' 'Rehearsal went without a hitch.' 'Capital! ha, ha!' And so forth in this style a quick patchy mosaic-work of talk kept up by hundreds of the most knowing men of the world, and the most *spirituelle* of artists and men of letters in London. Now, to make such a style of conversation possible, it is obvious that the same people must continually be in the habit of meeting upon a common ground. For the higher-class of theatres it is calculated that there are about fifty audiences—that is, that after a piece has been performed fifty nights, the number of persons likely to go to see it once will have been exhausted, and the audiences will begin to fall off if not reinforced for a time by the smaller number who are likely to go to see an average piece a second time. Thus a drama of fair attraction comes, in the ordinary course of things, to the close of its run. With the Opera it is very different. In no small degree, week after week, its audiences are the same. The casual visitors contribute a comparatively small amount to the treasury. It is, in fact, to the subscription list, to the regular rents paid by theatrical situarians, and for which they become entitled to let out certain boxes for what sums they please, that the management chiefly looks for reimbursement. The expenses of the Opera, therefore, being immense, and the circle of contributors to them limited, it is obvious that the Italian Opera must be an expensive luxury. But the fact is, that its peculiar advantages are incompatible with cheapness. Throw the Opera open to the general public, and as a place of familiar social intercourse it is ruined at once: its peculiar feature, in fact, being the number of conversable people whom you know and by whom you are surrounded. The introduction of audiences completely varying every evening must necessarily annihilate the very main source of its attraction.

And now here again comes in a feature in operatic philosophy which is of first importance. There are two general classes of habitués. The first and larger is composed of the subscribers, and by them of course the whole musical fabric is, so far as money goes, supported. But a long-existing custom decrees that free *entrée* shall be accorded to a certain proportion of gentlemen connected with literature, art in its chief branches, and journalism. These form the second and numerically minor class of habitués; but to the haven of talent and sparkling *esprit* which they introduce, no slight part of the pleasant conversational tone so characteristic of the Opera is due. Relieved from their desks, their pianos, or their easels, the Opera is the grateful focus to which they love to converge—there to retail the literary and artistic gossip of the day, to hear and chat over the hundred incidents, anecdotes, and *on dits* of the studio, the clubs, the *coulisses* of the theatres,

the lobbies and committee-rooms of THE House—in short, all that relates to what the French call the *causeries des salons*. The peculiar conversational tone—light, airy, yet intellectual—thus engendered, and made more bewitching still as it floats from box to box, receiving the graceful or *piquante* contributions of clever and accomplished women, forming that grand source of operatic gratification—other than the music—to which we have so often alluded, and in the charms of which lies the true secret of the permanent popularity with certain classes of society of the Italian Opera. To the privilege of admission to this species of intellectual and social enjoyment no man can aspire without certain qualifications—either that of wealth, intelligence, and social position, on the one hand, or that won by the intellectual power which elevates its possessor to the rank of a literary or artistic notability of the day on the other. Many a curious political secret has been whispered, many a brilliant article has been quietly concocted, many a successful literary enterprise has been first discussed, with the voices of Grisi, Lind, or Garcia ringing in the ears of the interlocutors. And in another world than that of journalism or letters—that mystic yet threadbare, that puerile yet powerful, that silly yet that magical circle of the *crème de la crème* of English aristocracy—how many a scandal has been born, how many a match has been discussed, how many an alliance of pride on the one side and gold on the other has been arranged, while the rich air quivered with the audible genius of Rossini or Mozart, and the hum of applauding amateurs drowned the low, eager tones of passion or of interest!

In the Opera, then, it is that these two worlds—that of aristocratic exclusiveness upon the one hand, and literary and artistic exclusiveness upon the other—draw mutually nearest on a common and neutral ground. There, within that charmed circle of yellow or crimson festooned boxes, gather night after night the glittering vanguard of English social, literary, and artistic celebrity. The casual visitor from the country, who makes a point of hearing the *prima donna* of the day—the Londoner who occasionally drops in to listen to a favourite opera, if he be a musician, or to applaud a favourite dancer, if he be an admirer of the dumb beauty of motion—are aware of but one-half of that which is going on around them. With their eyes rivetted upon the stage, they know nothing of the thousand interludes continually playing before the curtain. Knowing only what the management or the librettist chooses to tell them, they are unskilled to connect half of the phenomena of the evening with these faintly-whispered reports of operatic diplomacy which the initiated see indicated or echoed in an unexpected hoarseness or the excision of a particular aria—with eyes and ears, in fact, keenly and widely open, they sit as did the sultan in the 'Arabian Nights,' delighted with the song of the birds, but utterly unwitting the double pleasure which belonged to his vizier, who not only heard the sensuous music, but whose initiated organs understood the secret meaning of 'every twitter of the grove.'

Such, then, faintly indicated, are one or two of the secret influences—for secret to the mass of the public they undoubtedly are—which make the Italian Opera the formidable rival which it proves itself to all places of indigenous amusement. The mistaken views and semi-enmity with which it is regarded by many clever and patriotic people in their respect for our own legitimate drama, are founded upon a necessity which frequently compels them to see but half the picture. The vague, and, in fact, nonsensical charge against the common sense of the country, that a small but highly-intelligent and refined portion of the community would persevere in going to a place of amusement which afforded them no entertainment, merely because it was, in vulgar phrase, 'fashionable,' fades away in an instant before a perfect knowledge of the case. People go to the Opera just because, after a certain fashion which they like, they are more amused at the Opera

than elsewhere, and probably because, the higher and more perfect becomes our civilisation, the less inclined we are to trust altogether to others, instead of in some degree to ourselves, for our entertainment. A. B. R.

THE FIRST SLEEP.

A STORY FOR PARENTS.

LITTLE Emily Mansell was a great pet with her Aunt Hamilton; and as she had no mother, and Mrs Hamilton no child, it always brought high enjoyment to each whenever Emily's papa allowed her to go on a visit to her aunt. Indeed this happened pretty often. Mr Mansell was agent to a nobleman whose estates lay in different parts of the country; and as he was frequently obliged to go from home, on those occasions little Emily was mostly intrusted to Mrs Hamilton's care.

It was always a holiday time: feasting, petting, playing; every wish ungratified in her own quiet home was sure to find indulgence at her aunt's; or rather wants and wishes were excited and gratified there which never entered her little brain when more suitably employed, and which always sent her home listless and dissatisfied, until in healthier occupation their memory wore away. Mrs Hamilton was a gay and thoughtless person; her house mostly full of company, much vanity and flattery going on; and Emily, even though a little child, coming in for a share, and delighting in it so much, that it would have puzzled any one to identify the saucy little prattler dressed out with curls, ribbons, and laces in Mrs Hamilton's drawing-room with the gentle, loving child that used to read so quietly in her father's study window, looking up now and then to see if his letter were finished before she ventured to interrupt him even with a question.

She is in the window here too, but her little tongue is rattling on: no fear of interrupting important business now; no one better engaged than in listening to her trifling. At last the quick remark and the merry laugh die away, and in an impatient tone little Emily exclaims for the twentieth time that evening, 'Why doesn't Davy come?—what is keeping him, Aunt Caroline?' And again she turns fretfully from the oft-repeated soothing answer—'He is coming, darling; he will be here just now.'

Davy was the carrier who brought the supplies once a week from a large town some distance off. He was in especial request this day, as he was to have been the bearer of some toys, a large cake, and sundry other matters in honour of Emily's birthday; but the evening wore on—no Davy appeared: Emily had to do without her toys, and the assembled guests without their cake. It was hard to tell whether Mrs Hamilton or Emily—the old child or the young—was most disappointed; but the latter certainly testified her vexation in the more disagreeable manner: lingering in the window, refusing to be comforted until the last faint ray of daylight went out, and then rebelling against bed to cry herself to sleep on the sofa.

But she was asleep—soundly and sweetly too, as only childhood sleeps—when the rolling sound of wagon wheels made her aunt start up, joyfully exclaiming, 'Here is Davy at last; I am so glad little Emily stayed up after all!'

'She is fast asleep now; surely you will not think of awaking her?' exclaimed one of the more considerate members of the party.

'Ah, wait a while,' was the reply, with a mysterious smile.

Bells were rung, orders given; not only did a tray make its appearance with the desired birthday-cake, fruit, wine, and other materials for supper, but also the box with the expected presents, which was carefully laid on a table hard by.

'It is almost a pity to awake her,' whispered Mrs Hamilton, half relenting, as she bent over the calm, unconscious little sleeper; 'and yet it would be a still

greater pity to open the box without her, or to cut the cake without giving her a share.'

'Then let the box wait till morning,' rejoined the former speaker; 'and as to the cake, I think its size defies us all: no danger of Emily's share. You surely would not give it to her at this hour?'

'Oh, but she ought to see it whole; she would admire it so much. And as to the box, I am longing myself to open it. Besides, she must be awakened to be carried to bed.'

And Emily was awakened. Sleepy and bewildered, for a long time she did not understand what any one was about; and when at last she did, her admiration of the external ornaments of the cake was quite swallowed up in a desire to appropriate some of the interior. 'You hungry little thing!' exclaimed her aunt, quite disappointed; 'but they are always so when awakened out of their first sleep.'

On this excuse a large slice of the cake was bestowed; and by the time it was demolished, Emily's eyes became accustomed to the lights, and she began to look about her as sprightly as ever. She spied the well-known blue box, and for the first time comprehending the full extent of her good fortune, exclaimed, 'Ah! Davy is come at last!' as she sprang towards it, and impatiently tried to turn the key.

The company, who had also been engaged in discussing the merits of the cake and wine, now turned for fresh amusement to the box, and to Emily's eager expressions of delight as new doll, and gilded book, and painted coach were successively drawn out, inspected, approved of, and ordered to lie on the table. The 'what else?' died away; all the promised treasures were displayed in goodly range, yet still Mrs Hamilton kept her hand on the lid of the box, smiling at her little niece, as if doubtful whether to disturb her fulness of content even by fresh enjoyment; at last, yielding to her own impatience, she drew out the crowning gift—a real birthday suit, in which Emily was to have figured that day had not Davy's wheels tarried on the way so provokingly.

'Oh how beautiful!—how tasteful! Do try it on—let us see it at once,' resounded from every lip. Emily, at first unwilling to leave her toys, was bribed by another slice of cake; robed in state, admired, held up to the mirror to admire herself, until her little head, half turned with excitement and vanity, she more than entered into the spirit of the hour, and strutted up and down the room, nodding her plumes, and shaking out her flourishes to show them off.

But people will tire even of the best sport: the guests found it time to withdraw; and full time did Aunt Hamilton at last think it for little Emily to go to bed. Not so with the little lady herself: quite fresh from her sleep, she was fully awake to enjoyment now; the moments given to her new dress had been stolen from her toys, and back again she flew to them with renewed avidity when the admirers of the former had departed. In vain her aunt remonstrated, showed the hour, threatened to put out the candles; Emily coaxed, and cried, and lingered, until at last a third slice of cake won her over, and poutingly she retired as the clock struck twelve.

She tossed and turned on her pillow; felt as if she never should sleep again; thought of her toys, her fine dress; longed for the morning light; then when it did at last steal in through the chinks of the shutters, she found it pained her eyes, and turned them away; then her head grew hot and heavy, and she longed to sleep, but could not; and thoughts of company, and toys, and bright lights, all mixed confusedly together, until at length she was dropping into a sort of troubled doze, when Susan came to the bedside to say it was time to get up. For a moment she felt inclined to disregard the summons, but then the recollection of all she had to look at by daylight returned, and raising herself languidly, she dressed with many a yawn.

'This comes of last night's doings, Miss Emily,' said

Susan reproachfully: 'I hope 'twill be long again before you are awake in such a way out of your first sleep.'

'Indeed I hope so too, Susan,' replied the little girl in a contrite voice; 'for I could not sleep again when I wanted, and I feel—oh so weary—so sleepy now!'

But when night came again there was no quiet rest for Emily: the disturbed hours of the night before; the excitement, and, above all, the rich cake, had done their business; and there she lay tossing, hot and feverish, worse and worse, as the hours rolled on. For many a day she lay thus, her loving father, her indulgent aunt, her faithful Susan, watching in turns beside her; for many a day, with vain regrets and sinking hope, they promised themselves and one another that, if restored to them again, she should be more judiciously treated. She was at length restored, and, unlike most 'vows taken in pain,' the resolution was kept.

Circumstances favoured her father's wish to remove his little Emily for the present from her too indulgent aunt. His employer had an Irish property which he desired to place under Mr Mansell's management, and as constant personal superintendence was necessary, he agreed to fix his residence there. Emily's severe illness, as is often the case in youth, had altered both her character and constitution: her mind matured and expanded as rapidly as her bodily growth. Living chiefly with her papa, and talking much with him during her weeks of convalescence, she felt—perhaps for the first time—how precious she was to him; how dearly she loved him; and it was with a sense of indescribable delight she heard her father say, that though leaving much to which he was attached, removing from familiar scenes and friends, he was sure he should never feel lonely with such a companion as his 'good little Emily.'

Soon she dearly liked their Irish lodge, with its roses, its lake, and its wild mountain view; their Irish Molly too, with all her endearing epithets and eloquent histories—their English servants had been dismissed, 'not pulling well with the natives,' and Molly took a pride as well as pleasure in verifying her retort that 'they were no loss.' One English lady, who had the care of Emily's education, alone remained in addition to the family; and she judiciously led her little charge to appreciate all that was admirable, as well as merely amusing, in the national character, so that the jibes and supercilious airs which had given so much offence in the domestics, were soon forgotten in the unaffected interest and cordiality testified by the other members of the family.

Thus time wore on for three, or nearly four years; during all that while Emily had been blessed with uninterrupted health. According to the old maxim, she lay down with the lamb and rose with the lark, and had probably forgotten what it was ever to awake out of her first sleep till the morning dawned. She had grown as rosy-cheeked and as merry as any little Irish lass; as obliging, as intelligent, able and ready to help herself and those about her; and though, in one solitary visit, Aunt Hamilton declared she would be spoiled for a fine lady, she was obliged to admit that she promised to turn out something better still.

It was Christmas, and Mrs Blandford, Emily's governess, had gone to spend the holiday weeks with her relatives. Emily—full of importance, trying to follow all her friend's directions, to fill her place and her own at this busy season—had at last gone to rest, tired yet happy, and was fast asleep in her little white-curtained bed in the dressing-closet outside her father's room. It was there she had always slept, and it was his nightly habit, as he passed through it to his own, to pause a moment beside his little daughter with a whispered prayer and a soft kiss on her cheek, which, though it never unclosed the eyelids, was acknowledged even in sleep by a half-formed smile.

This night the pause was longer, the prayer more fervent; sorrowful thoughts were busy in his heart—the preponderance that the little evil often assumes over the much good—and in the disappointment and annoy-

ance of a recent instance of ingratitude, he felt as if all the time he had spent, all the benefits he had conferred, were at once swept away. We all have had such moments. Well for us not to be quite solitary then; and with a yearning for companionship, Mr Mansell still lingered, half-tempted to call up the life and expression of those sweet, tranquil features, and hear one more loving 'good-night' before he retired to rest.

After long trial and forbearance, he had found himself compelled to bring ejectments against some refractory tenants. They still kept possession; and warnings and threats had been mutually exchanged. At this point Mr Mansell had paused, still reluctant to proceed to forcible measures; and mistaking his indulgence for timidity, a threatening notice had been sent him on the previous evening, with the usual hieroglyphics of a coffin and death's head, warning him to drop his proceedings or quit the country.

Well-intentioned, judicious, and popular, this was the first resistance he had met with, and he felt it most sensitively; almost ready to arraign himself for a state of things which too often forms the rule instead of the exception. Musing thus, he lingered, as we have said, by his child's bedside, his feelings gradually calming down under the unconscious influence of the peaceful slumberer. At last, as he turned away, the movement, or the light of his candle, awoke her suddenly, and her opened eyes rested full on her father's troubled face.

'What is the matter, papa?' she exclaimed, even at a glance comprehending that he did not look like his usual self. 'Are you ill? Is any one ill? Am I wanted?' and pushing back her bright curls, she started from her pillow, and gazed with a look of alarm into her father's face.

'No indeed, my poor child; what a shame for me to awake you! I am nearly as bad as Aunt Caroline long ago, though, unlike her, I have nothing pretty to show. Good-night now; go to sleep again,' and with another kiss he would have passed on, his own heart lightened by the little interruption to his thoughts, had not Emily thrown her arms round him, and detaining him, whispered—'Something was the matter, my own papa; I saw it in your face. I think I saw it in my sleep. Were you tired, or sorry, or angry? Which was it, papa?' and her eyes fixed earnestly, as if involuntarily reading his heart.

'Angry! Was it with you, Emily?' and quickly the inquiring gaze brightened off into her own sweet confiding smile, as she looked rather than said how far such an idea was from her thoughts. 'Then with whom, my own child? What could put such a thought in your little head? Do you often see me angry?'

Another smile, and a deprecating wave of the head; and the colour mantled on her cheek as she playfully answered, 'You know I gave you choice of three reasons—tired, sorry, angry. Why, papa, why did you fix on the most unlikely and the worst?' And again the searching eyes were raised a moment to his face, the colour deepening to crimson as almost as quickly she looked away.

'There is something in your question, Emily,' said her papa gravely, laying down his candle, and seating himself by her bedside; 'for once you are right in everything: I am tired, sorry, angry; but again, what put the notion into that sleepy little head?'

'Oh, papa! indeed I am wide awake.' Then seeing her father smile, she added quickly, 'Don't I know your face too well? Couldn't I read its passing thoughts, even if I never had the key?'

'Well; and the key?' inquired her father, still smiling.

She answered earnestly, 'Papa, you will think me very foolish; perhaps very vain. Indeed I did not mean ever to have spoken of it; but now,' added she, brightening up, 'now that you have made your little confession, I may make mine; now that I know you are already anxious, I need not fear to make you so—for I do believe it is all about the one same thing. You

know old Norry Flaherty that has had "the rheumatics" all the winter? I was giving her some flannel along with the others yesterday; but she looked so old and weak, I made her wait to get a warm bowl of coffee—she delights in that. When she was done, she rose up and wished me all kinds of blessings, then turned and said something in Irish to Molly, which, from the changing expression of her face, and a word which I could understand here and there, surprised me a good deal. The moment she was gone, I asked Molly what she had said: she coloured and hesitated'—

'Something like yourself, my little Emily, just now.'

'Yes, papa; do not laugh at me: this is a serious matter. The more Molly hesitated, the more anxious I was to know. At last she said—you know, papa, it was Mrs Flaherty said this—that I was an angel to the poor, and your guardian angel too; that was the kind part of her speech. But when I asked Molly what made her eyes flash, and insisted on knowing, she told me—the words were, "Even that cannot screen him for ever!"'

'You should have mentioned this to me at once, Emily,' said her father gravely.

'Oh, papa, it only happened to-day; and indeed I was so busy, it passed out of my mind until I saw your look just now. Besides,' added she hesitatingly, 'I did not know, papa, how far it might be right in a little girl like me to talk of your business even to yourself; and it seemed as if the best thing I could do was to bury it in my heart, and try to be more and more to you—like what the old woman said.'

Her father kissed her tenderly, laid her head on the pillow, smoothening down her curls, as he had used when she was a fairy child; then yielding to the desire for companionship that had first detained him at her bedside, he continued talking for a while, gradually warming into confidence, and, half-forgetful of the youth of his listener, entering into a detail of his present feelings and position. At length, noticing her rapt attention, he added, 'Feel no uneasiness, my child; I am fully equal to this crisis, though grieved to seem aught else than the benefactor of the people over whom I am placed. You have successfully aided me in this object, and for that reason deserve my confidence, young as you are. The trust I now repose in you—the trust you have in me—will fortify your mind against any of those obscure hints or threatenings, even as it has relieved my mind to unburthen it to my child.'

Emily listened to her father's words with a proud and happy heart; his parting recommendation to go to sleep at once was in vain; she vainly tried to follow his advice, and once again in her life tossed and turned on a sleepless pillow. A former foolish night came back to her recollection to fill her heart with thankfulness that it was so different now: no feverish symptoms, no reproachful thoughts, now troubled her unrest. Sleepless indeed she lay, but quietly self-communing; and when the morning light convinced her that any further efforts at rest were fruitless, she sprang from her bed almost as much invigorated as if that rest had never been disturbed.

Her father seemed pleased at her bright looks, but made no farther allusion to their last night's conversation; and though Emily felt as if it had drawn them together by a redoubled tie, she spoke no word either of the projects that had occupied her sleepless hours, and was now filling her young heart. Her morning duties over, she summoned the light-hearted Molly to bear her parcels, and accompany her in one of her annual Christmas rounds. One by one she visited the cottages, where her presence always brought sunshine—commending, reproving, encouraging, as the case might be, but uniformly leaving the impression, 'Sure she is for our good.'

At last she reached old Norry Flaherty's door, and though the usual kindly welcome was for once unuttered, she unhesitatingly stepped in. A significant look was exchanged between the old woman and her

slatternly daughter-in-law as they both turned their glance on the husband of the latter, who lay drowsily stretched on a settle near the fire. Emily was accommodated with a chair; Molly stood by; and the first greetings over, the old woman turned somewhat angrily to her son, reproving him for 'never offering to stir, and the young lady to the fore.'

The man lazily opened his eyes, as if he had perceived her for the first time; but before he had time to growl out an answer either of resistance or apology, Emily's sweet accents had intreated him not to disturb himself, adding that he seemed tired, not ill, she hoped.

The young man could not resist this; he gathered himself up, and assumed a more respectful, but still listless attitude, leaning against the post of the door. Emily turned a little towards him, but continued her conversation with the two women, until she had said all she wished, and bestowed her little Christmas gifts for themselves and the children. Flaherty still maintained his position, apparently occupied with the outward prospect, whistling now and then, but listening with curiosity all the while, as was evidenced by the impatient jerk of his shoulders as his mother reiterated blessings on their young visitor, and his sudden attention, as she went on to say, that indeed they did not expect any such favours just now.

'And why not, Norry? Why should you think I would forget any of my old friends?'

'Oh yea! miss, it isn't for me to say; but by reason of the master's doings, we know our welcome is wore out, and sure you and he are all as one.'

'So we are indeed, Norry,' replied Emily warmly, and with a little touch of her new-born confidence; 'one in heart and mind. All that he does is right in my eyes, and I never take a step disapproved of by him.'

'Wisha, we knew it,' drawled the younger woman coldly, throwing another meaning glance from her mother-in-law to her husband.

'Come, Miss Emily; we'll be late,' interposed Molly, evidently not much in love with their reception; and suiting the action to the word, she took leave of the inmates, and passed out through the door. Emily lingered a moment yet before she obeyed her hint; then, as if her mind were at once made up, she also rose and took her leave. She paused a moment on the threshold as the man politely made way, and allowed her eyes to rest on the wild but noble view stretched out before them in the golden light of the declining sun. He followed her admiring gaze, caught her involuntary exclamation of delight; and as if the conviction that one in a class so superior to himself could yet have feelings in common with him, in a degree unlocked his heart; he muttered in a low yet not disrespectful tone, unconsciously adopting the sentiment of a far greater personage, "'Tis a place worth fighting for!'

Emily turned her sweet face towards him with a pained and wondering expression, as she answered, 'Surely, Flaherty, it is a place worth loving; but who could ever think of fighting in the face of such a view of the works of God? It makes the heart glow indeed, but it is with love to Him and all the creatures he has made.'

'That's as young ladies think,' replied Flaherty with a cavalier yet not uncivil air.

'Is it not as Christians think?' replied Emily with unvarying sweetness; 'a thought prompted especially at this blessed time, when the Lord of all came to bring "peace and goodwill amongst men."'

Her hearer shifted his position uneasily, his countenance seemed to grow more gloomy, but he continued silent. Emily went on, 'Such would be my first thought; but the next, next to loving the place, my thought would be, it is worth working for too. You may say to this also, Flaherty, that it is a young lady's thought, spoken of what she has no experience; but I, even in my own way, never got anything worth having without working for it first, and then I always found the enjoyment was doubled.'

'Work! wisha, we work like slaves, and where's the good of it?' burst impatiently from her listener. Emily's eyes rested for a moment on his indolent lounging figure, his hands in his pockets, his pipe in his mouth; then turned to the neglected garden, the disjointed footway, the broken thatch. He understood her glance, and moodily muttered, 'It was not always so.'

'No, surely,' replied Emily with much animation; 'even I can recollect it so different when this time two years I was here. Do you remember, Michael, you were digging that square for the early cabbages, the little boys weeding the right-hand border, Mary was making up a nice pink frock for the baby, and old Norry—she had no rheumatism then—she was spinning away in the sunshine at the door? Have not I a good memory now?'

The women had drawn near within the cottage, and low exclamations of mingled wonder, pleasure, and regret accompanied her words, but they did not interrupt the conversation. Michael's lip quivered, and after a moment's silence, he civilly replied, 'And I have my memory too, miss, or maybe matters would be worse with others before now!'

'Do you know, Michael, I have heard that already?' replied Emily frankly. Then, unheeding his startled look, she continued, 'You will hardly think I remained awake nearly the entire of last night thinking of you and yours—not with fear'—added she, replying to his glance, 'but planning, and at last hoping to do you some good.'

There was no doubting her simple earnestness; Michael implicitly believed her, nor even thought it strange that one like her should take an interest in his fate. She continued, 'This prospect is surely glorious, this home very dear, but sin and sorrow changed even Eden itself. You have suffered much, you have erred much, Michael: I do not say which has caused the other, but the effects of both are plain, and it will be hard to efface them here. In another land it would not be so; in a land where so many of your countrymen—and not the worst of them—are going: new companions, new habits, new fortunes may await you there. This was my thought last night, prompted by something I had heard. I thought to speak to Norry to-day, but am twice better pleased to meet yourself; for, Michael, if you wish to make up your mind to emigrate, I will ask papa to give you the means, and though, indeed, 'tis all my own idea, I am sure he will not refuse.'

Michael's countenance, which had been gradually softening, again assumed its determined expression, imagining himself called on at once for a decision; but Emily hastened to add in still kindlier tones, 'Take time to consider; then come down to me: whatever you decide on, at anyrate we sha'n't fall out;' and then with a gesture of farewell she hurried away.

Molly had been an admiring witness of her young mistress's persuasive powers, and many a glance exchanged between her and the two women over Emily's shoulder showed their mutual appreciation of her proposal. They knew well that Michael had no other chance against the bad associates and bad practices into which he had fallen; and to see him break with them completely, before he was driven to some lawless act, was a blessing almost beyond their hopes. The result may be anticipated: Michael and his brothers, thinking they had at last a favourable opening through the young lady's ear, made one effort more to obtain the terms they wished; but finding that out of the question, they yielded to Emily's advice, sanctioned by her father's approval. Nothing could have been more satisfactory to him: he wished to make examples, not victims. Those who were still able to retain their farms redoubled their exertions to become good tenants, while the others, furnished with sufficient funds, were borne by the next spring breezes in safety across the Atlantic; there, turning over a new leaf, they have every prospect of succeeding, as they never would have done at home.

A few months more brought a visit from Aunt Hamilton, when this instance of Emily's diplomacy was nar-

rated with affectionate pride by her father. He had scarcely concluded, when his sister abruptly replied, 'Richard, you ought now to think of sending Emily to school!'

Mr Mansell opened his eyes very wide as he echoed her words, 'To school? What! part with my darling companion now that she seems, if possible, doubly dear?'

'Yes, for that very reason. Do you remember long ago how bitterly we repented awaking her too early? You are doing the very same thing now yourself.'

'Ah, yes! I remember,' replied the father, recovering from his start with a long sigh of relief. 'I awoke her once too. But the result was completely different. Be assured, my dear Caroline, that everything depends on the awakening cause. Let us only show reason good, and all will be well, even though we may seem inopportune to arouse them out of their First Sleep.'

DR CARPENTER ON ALCOHOLIC LIQUORS.

ALTHOUGH alcoholic liquors and their effects on the human system have been the subject of investigation among medical authorities for many years, the public will no doubt put a high estimate on a new report by a physiological authority of such repute as Dr Carpenter. The work before us* is a prize essay, which gained that distinction (with one hundred guineas) in a competition where fifteen writers entered the field. The author first expounds the influence of alcohol on the physical, chemical, and vital properties of the animal tissues and fluids, and shows by many incontestable proofs that this influence is of an evil character, rendering the phrase *intoxication* peculiarly appropriate etymologically, seeing that it implies simply poisoning. Among its effects on the health of the human subject we are particularly struck by its concern with the filling of our lunatic asylums. In returns from 98 such institutions in England and Wales, it was found that out of 12,007 cases, no fewer than 1799, or nearly 15 per cent., were set down to the score of intemperance, besides 551 more attributed to vice and sensuality, 'in which excessive use of alcoholic liquors must have shared.' 'In pauper lunatic asylums, the proportion of those who have become insane from intemperance is usually much larger than it is in asylums for the reception of lunatics from the higher classes, among whom intemperance is less frequent, while causes of a purely moral and intellectual nature operate upon them with greater intensity.' One curious particular is worth notice, that Dr Hutchison of the Glasgow Asylum found an increase in the proportion of lunacy from drinking during the years 1845 and 1846, in consequence, as he thought, of 'the excitement in which the community was kept by that universal spirit of gambling which seized on society like an epidemic mania'—there being 'a great connection between general excitement and a craving for stimulants.'

The London coal-heavers, ballasters, and draymen, will drink as much as two gallons of porter daily, and even spirits besides, and they usually have an appearance of great bodily vigour—so long at least as their labour is carried on in the open air; but their constitutions break down early, and when they sustain an inflammatory attack, or any local injury, it is exceedingly apt to run on to a fatal termination, 'in consequence, it is evident, of the deficient plasticity of the blood, the low assimilative power of the solids, and the general depression of the whole vital energy, resulting from habitual over-excitement. Fox-hunting squires, who spend the evening over the bottle, are also notoriously bad subjects for medical or surgical treatment, owing to the imperfect condition of their nutritive functions. In remarkable contrast to these—the dray-

* On the Use and Abuse of Alcoholic Liquors in Health and Disease. By William B. Carpenter, M.D., F.R.S., Examiner in Physiology in the University of London. London: Gilpin. 1860.

men and ballasters—are those trained to pugilistic encounters, 'the latter having been brought to a condition of the highest possible health by active exercise, abundance of nutritious food, occasional mild purgation, and either entire abstinence from fermented liquors, or by the very sparing use of them.' 'Men thus "trained" recover with remarkable rapidity from the severe bruises which they are liable to receive.'

The effect of stimulants in predisposing the body to endemic diseases and pestilence is now universally admitted among medical practitioners. A curious illustration is here given. When cholera visited Manchester, the nurses in the hospital were allowed to go home after working six hours. They took the disease, and died of it in such numbers, that fears were entertained of the failure of the supply. 'It was found that they were much given to alcoholic potations (with the idea, probably, of increasing their power of resisting the malady) during their leisure hours; and they were therefore confined to the hospital, and debarred from obtaining more than a small supply of alcoholic drink; after which not a single fresh case recurred amongst them.' At the visitation of the cholera to London in 1849, it was found, in the establishments where numbers of men were employed, that the victims were chiefly the men addicted to drink.

The general benefit to life arising from sober habits is acknowledged as a principle of action in the conducting of life-assurance business—only men of sober habits being received. In consequence of the selection of lives for insurance, with such limits as general healthiness and temperance, mortality is in lower proportion among the assured than in general society. 'Thus at the age of 40 years, the annual rate of mortality among the whole population of England is about 13 per 1000; whilst among the lives insured in life offices it is about 11 per 1000; and in those insured in friendly societies it is about 10 per 1000. Now the average mortality for all ages between 15 and 70 years is about 20 per 1000; whereas in the Temperance Provident Institution, after an experience of eight years, and with several lives above 70 years of age, the average mortality has been only 6 per 1000, up to the present season, in which it has undergone a slight increase from the cholera epidemic. It is worthy of remark, however, that although many of the insurers in this office are of the poorer class, whose condition and employments expose them much more than the middling classes generally to the endemic causes of cholera, no more than 8 have died of this disease out of the total of about 3500 insurers. As a means of farther comparison, the following table may be subjoined, in which the mortality of the insurers in the Temperance Provident Institution, for the first five years, is compared with that of the insurers in other offices during the corresponding period of their existence:—

A issued 944 policies, and had 14 deaths; being equal to 15 per 1000.	
B ... 1901 27 14 ...	
C ... 838 11 13 ...	
D ... 2470 65 26 ...	
TPI ... 1396 12 7½ ...	

During the sixth year of its existence, only two deaths occurred out of the whole number of insurers in the Temperance Provident Institution, by which its annual average of mortality was reduced still lower.'

In the Indian army the mortality is less among the officers than among the men: the former are now generally abstemious, while the latter generally indulge much in liquor. Temperance societies were at one time making vigorous progress, and effecting much good among the troops in India, when an order arrived for putting them down, because of a jealousy at headquarters as to any organisation but the regimental. A medical officer stated, within a month of the arrival of this order, that he had forty cases of delirium tremens in his own regiment. The rule of the service was to serve out two large drams to the men every day. A soldier took his dose in the morning when the thermometer

was ranging from 70 to 90 degrees; it increased his thirst, and sent him to drink more during the day. Hence it is not surprising to hear of an artillery sergeant testifying that out of 100 men under his command he has had eight in strait-jackets at one time. The general healthiness of the native over the British troops is well known. We might suppose it to be owing solely to the better adaptation of the former to the climate. With this theory, however, it is not easy to reconcile the fact, that in the Madras presidency the mortality has been found lowest among the Europeans. It is found, on inquiry, that in the Bombay presidency, where mortality is comparatively small among the natives, the habits of these are abstemious as to both animal food and liquor; while in Madras, the native troops, being chiefly Mohammedans or Hindoos of low castes, live very much in the same manner as Europeans. The inferior mortality of the British troops in Madras, as compared with those in Bombay, is attributed by Colonel Sykes to the difference of their habits—the Bombay troops indulging largely in rum, while those of Madras use porter, and only a small quantity of arrack, which is a less noxious spirit. When, in addition to these facts, we learn that the average daily per-centage of the soldiers belonging to temperance societies in the hospital was 3·65, in contrast with 10·20, or nearly triple, of the other men, we cannot doubt that drinking spirituous liquors has much to do with the higher mortality of the troops in India. A temperate regiment, the 84th, in an unhealthy station, lost only two-fifths of the average of the garrisons in healthy stations during a certain space of time.

There are many facts, some of them the result of direct experiment, to show that men who abstain from alcoholic liquors can do more work, and better sustain exposure to cold, than others. Out of twenty-three millions of bricks made at a work in 1841, the average per man made by beer-drinkers was 760,269, whilst the average for the teetotallers was 795,400. The beer-drinking athletes of our London docks must not boast of being at least stronger than they could expect to be without liquor; for the porters of Constantinople, who are accustomed to carry far heavier loads than English porters, never drink anything stronger than coffee.

Leaving the reader to consult Dr Carpenter's volume for much illustration of the same kind, we would devote the remainder of our space to what we think an important question connected with the subject of alcohol.

To quote Mr Tremenhere, of the Commission on the Mining Population—'A remarkable and most satisfactory instance of a successful attempt to put a check upon the indulgence in ardent spirits has occurred at the iron-works of Messrs Houldsworth of Coltness, employing about eight hundred colliers, miners, furnace-men, &c. Much loss and annoyance had frequently been occasioned by the negligent or wilful misconduct of workmen under the influence of this habit; and the Messrs Houldsworth, having in vain endeavoured to put an end to it by persuasion and advice, resolved to do what they could by removing the temptation. They accordingly, about three years ago, forbade the sale of spirits at the store, and at the inn at their works, and ordered that the furnace-men should not be allowed to drink spirits during their hours of labour. These men had been accustomed to drink four or five glasses of whisky during each "shift," in addition to what they might choose to drink at their own homes. They remonstrated strongly, and affirmed that it was impossible for them to do their work without this quantity of whisky. They were not long, however, before they found their error: they now drink nothing but water during their work, and tea and coffee at their meals; what they spent in whisky they now spend in wholesome or nutritious food; they allow that they do their work better, and that the change has been a great blessing to themselves and their families; and that it is the best thing that ever happened to them. I was

afterwards informed that among the colliers and miners there was a marked improvement from the same cause.

A similar check, as is well known, has been given to indulgence in liquors in merchant vessels, particularly in those of America, and various good effects have resulted. The question has consequently been suggested to us—Is there anything in the circumstances of the public at large to prevent a government from giving the same check to drinking among its subjects which the master of a work or of a vessel imposes on those immediately under his control? The thinking part of our community are fully sensible of the fatal effects of the use of alcohol in our state—that it demoralises our humbler class of people, fills the jails and work-houses, and, by leading to a general impoverishment of the working-people, helps greatly to create that violent contrast of condition between classes which is now found to be a source of so much danger. Society sees these things, but despairs of a speedy remedy. Some talk of a diminution of the number of licenses; others call for more education: very good expedients in their way, but of most unsatisfactory slowness of operation. We feel far from convinced that a speedy remedy is out of hope. A check to the manufacture and sale of spirits would of course be a measure of some difficulty, but we cannot believe it to be totally impossible; and we think the difficulty would be worth encountering for the sake of the expected benefits. There is, if we are not mistaken, at least one state of America where the restrictions on liquor amount nearly to a prohibition of its existence; and if this can be done under the weak executive of our transatlantic friends, why should it not be effected by us? Say that our public is not ripe for such a measure—let a few energetic individuals combine to work upon them through the pulpit, the platform, and the press. The powers of a Peter the Hermit are not copyless on the face of modern Europe; the human heart has all the predispositions which it ever had. The desire for the measure, or at least its results, exists already: all that is required is a conviction of its practicability. After seeing so many wonderful results produced by 'agitation,' we certainly, for one, could not despair of seeing this also.

BORAX LAGOONS OF TUSCANY.

IN a mountainous district of Tuscany, lying about twenty miles west of Sienna, are situated the extraordinary lagoons from which borax is obtained. Nothing can be more desolate than the aspect of the whole surrounding country. The mountains, bare and bleak, appear to be perpetually immersed in clouds of sulphurous vapour, which sometimes ascend in wreathed or twisted columns, and at other times are beaten down by the winds, and dispersed in heavy masses through the glens and hollows. Here and there water-springs, in a state of boiling heat, and incessantly emitting smoke and vapour, burst with immense noise from the earth, which burns and shakes beneath your feet. The heat of the atmosphere in the vicinity of the lagoons is almost intolerable, especially when the wind blows about you the fiery vapour, deeply impregnated with sulphur. Far and near the earth is covered with glittering crystallisations of various minerals, while the soil beneath is composed of black marl, streaked with chalk, which, at a distance, imparts to it the appearance of variegated marble. As you proceed, you are stunned by the noise of constant explosions, which remind you that you are traversing the interior of a mighty crater, which in past ages was perhaps filled with a flood of liquid fire.

Borax was first brought to Europe, through India, from Tibet, where it is found in a mountainous region, resembling in character the district of Tuscany we have described. If we except some doubtful specimens, said to have been discovered in coal-pits in Saxony, we may assert that the mineral is found nowhere else in Europe, or that the territories of the Grand Duke enjoy

a natural monopoly of the article, which, with the growth of the manufacturing system, is coming more and more into use every day, especially in France. In former times, when the value of the lagoons was not understood, the hollows and gorges in the mountains where they are situated were regarded by the superstitious peasantry as the entrance to hell. Experience taught them that it was in many respects a region of death. Whatever living thing fell into the lagoons inevitably perished, for the devouring acid almost in a moment separated the flesh from the bones. Cattle were frequently thus lost, and the peasants themselves or their children sometimes encountered a similar fate. A celebrated chemist, engaged in making experiments on the impregnated water, accidentally fell into a lagoon which he himself had caused to be excavated, and perished immediately, leaving a wife and several children in indigence.

For many ages no use was made of the boracic acid, and the whole district containing it—altogether about thirty miles in length—was dreaded and shunned by the inhabitants. Many inducements were vainly held out to the peasantry to cultivate the lands in the neighbourhood, which might generally be obtained for nothing. From time to time a few adventurous families would take up their residence near Monte Cerboli, and bring a few fields into cultivation, leaving, however, more than nine-tenths of the land fallow.

About the middle of the last century, Hoefer, who is described as apothecary to the Grand Duke, first detected the presence of boracic acid in the lagoon Orcherio, near Monte Botardo. Masgagin, a professor of anatomy, found the mineral in a concrete state in several streams issuing from the lagoons, and suggested the propriety of establishing manufactories of borax. As late, however, as 1801, in consequence of the failure of numerous experiments, Professor Gazzeri arrived at the conclusion that the quantity of acid contained in the water of the lagoons was too small to render the working of them profitable. But this opinion was based on the old practice of attempting the extracting the mineral by the use of charcoal furnaces. It was M. Larderel who introduced the improved method of employing the hot vapours of the lagoons themselves in the elaboration of the acid, and may be said to have invented the present method, which will probably go on improving for ages.

The system of the Chevalier Larderel, now Comte de Pomerance, displays at once great ingenuity and courage. The *soffioni*, or vapours, having been observed to burst forth with more or less vehemence in various parts of the mountains—which, fortunately for industry and commerce, are copiously irrigated with streams of water—the idea was conceived of forming an artificial lagoon on the site of the most elevated vent. A large basin having been excavated, the nearest stream was turned into it. The burning blasts from below forcing up their way through the water, keep it in a state of perpetual ebullition, and by degrees impregnate it with boracic acid. Nothing can be more striking than the appearance of such a lagoon. Surrounded by aridity and barrenness, its surface presents the aspect of a huge caldron, boiling and steaming perpetually, while its margin trembles, and resounds with the furious explosions from below. Sometimes the vapour issues like a thread from the water, and after rising for a considerable height, spreads, and assumes an arborescent form as it is diluted by the atmospheric air. It then goes circling over the surface of the lagoon, till, meeting with other bodies of vapour in a similar condition, the whole commingling, constitute a diminutive cloud, which is wafted by the breeze up the peaks of the mountains, or precipitated into the valleys, according to its comparative density.

To stand on the brink of one of these deadly lakes, stunned by subterranean thunder, shaken by incessant earthquakes, and scorched and half suffocated by the fiery pestilential vapour, is to experience very peculiar

sensations, such as one feels within the crater of Vesuvius or *Ætna*, or in the obscurity of the Grotto del Cave.

Another lagoon is scooped out lower down the mountain, the site being determined by the occurrence of soffioni; and here the same processes are followed, and the same phenomena observable. The water from the lagoon above, after it has received impregnation during twenty-four hours, is let off, and conducted by an artificial channel to the second lagoon; and from thence, with similar precautions, to a third, a fourth, and so on, till it at length reaches a sixth or eighth lagoon, where the process of impregnation is supposed to be completed. By this time the water contains half per cent. of acid, which Professor Gazzeri considered far too little to repay the expense of extracting it. From the last lagoon it is conveyed into reservoirs, whence again, after having remained quiescent a few hours, for what purpose is not stated, it passes into the evaporating pans. 'Here the hot vapour concentrates the strength of the acid by passing under shallow leaden vessels from the boiling fountains above, which it quits at a heat of 80 degrees Reaumur, and is discharged at a heat of 60 degrees (101 Fahrenheit).'

The evaporating pans are arranged on the same principle as the lagoons, though in some cases almost four times as numerous, each placed on a lower level than the other. In every successive pan the condensation becomes greater, till the water at length descends into the crystallising vessels, where the process is completed. From these the borax is conveyed to the drying-rooms, where, in the course of a very few hours, it is ready to be packed for exportation. The number of establishments has for many years been on the increase, though about twelve or fourteen years ago they did not exceed nine. Nothing can be more fallacious than the opinions formed by hasty visitors on matters of this kind, which are susceptible of perpetual improvement. When the produce was from 7000 to 8000 Tuscan pounds per day, the manufacturers were supposed to have reached the maximum, because all the water of the mountains was supposed to have been called into requisition. Experience, however, is perpetually teaching us new methods of economy; and though it would a priori be impossible to say by what means this economy is to be effected, we cannot permit ourselves to doubt that the manufacture of borax in Tuscany will hereafter be carried to a degree of perfection greatly transcending the expectations of those who formerly wrote on the subject. One of these observes the atmosphere has some influence on the results. In bright and clear weather, whether in winter or summer, the vapours are less dense, but the depositions of boracic acid in the lagoons are greater. Increased vapours indicate unfavourable change of weather, and the lagoons are infallible barometers to the neighbourhood, even at a great distance, serving to regulate the proceedings of the peasantry in their agricultural pursuits.

As the quantity of boracic acid originally contained in the water of the lagoons is so very small as we now know it to be, we can no longer wonder at the opinion formerly entertained, that it did not exist at all. After five or six successive impregnations we see it does not exceed half per cent., which, estimating the quantity of borax at 7500 pounds a day, will give 1,500,000 Tuscan pounds, or 500 tons, of water for the same period. By the construction of immense cisterns for the catching of rain water, by the employment of steam-engines for raising it from below, and probably by creating artificial vents for the soffioni, the quantity of borax produced might be almost indefinitely increased, since the range of country through which the vapour ascends is far too great for us to suppose it to be exhausted by the production of 7000 pounds of borax a day. Science in all likelihood will bring about a revolution in this as in so many other manufactures, and our descendants will look back with a smile on our hasty and unphilosophical decision.

We are without information on many points connected

with the population of those districts, to throw light on which it would be necessary to institute fresh investigations on the spot. The lagoons are usually excavated by labourers from Lombardy, who wander southward in search of employment in those months of the year during which the Apennines are covered with snow. They do not, however, remain to be employed in the business of manufacture. This is carried on by native Tuscan labourers, who occupy houses, often spacious and well built, in the neighbourhood of the evaporating pans. They are in nearly all cases married men, and are enabled to maintain themselves and their families on the comparatively humble wages of a Tuscan lira a day. It would have been satisfactory to know the number of the Lombard navigators from time to time employed in excavating the lagoons, as well as of the native labourers, who carry on operations after their departure; but we may with certainty infer the successive appearance of fresh soffioni on the sides of the mountains from the perpetually-recurring necessity of excavating new lagoons. Again, from the immense increase of borax produced in former times we may safely infer its increase in future. The quantity obtained was quadrupled in four years by superior methods of extraction, by economy of water and vapour, and other improvements suggested by experience. There can, therefore, be no doubt in our minds that similar improvements will produce similar results. In 1832, about 650,000 Tuscan pounds were obtained; in 1836, 2,500,000.

We quote the following suggestion from the observation of a traveller:—'It appears to me that the power and riches of these extraordinary districts remain yet to be fully developed. They exhibit an immense number of mighty steam-engines, furnished by nature at no cost, and applicable to the production of an infinite variety of objects. In the progress of time this vast machinery of heat and force will probably become the moving central point of extensive manufacturing establishments. The steam which has been so ingeniously applied to the concentration and evaporation of the boracic acid, will probably hereafter, instead of wasting itself in the air, be employed to move huge engines, which will be directed to the infinite variety of production which engages the attention of the industrious artisans; and thus in course of time there can be little doubt that these lagoons, which were fled from as objects of danger and terror by uninstructed man, will gather round them a large intelligent population, and become sources of prosperity to innumerable individuals through countless generations.'

Whoever has travelled through Tuscany, will everywhere have observed that the peasants live in better houses than they do anywhere else in Europe. Some one has said that nearly all their dwellings have been built within the last eighty years, an observation which in itself shows the substantial nature of their tenements, for where else will a peasant's house last so long? In the secluded mountain valleys, where agriculture supplies the only employment of the industrious classes, you sometimes meet with very ancient cottages, built quite in the style of the middle ages, with an abundance of projections and recesses, all calculated to produce picturesqueness of effect. The modern houses, more particularly in the district of the lagoons, are constructed more with reference to comfort than show, the object being to secure as much room and air as possible. In most places a garden is attached to every dwelling; and where trees will grow, a large linden or chestnut stretches its large boughs lovingly about the corner, and sometimes over the roof, of the dwelling. Under this the peasant and his family sit to enjoy themselves on summer evenings. Not to be entirely idle, however, the father is usually engaged in weaving baskets, while the children amuse themselves with cleaning and preparing the twigs; the mother, often with a baby in her lap, applies herself to the reparation of the family wardrobe; and the whole group, especially when lighted up by the slanting rays of the setting sun,

presents to the eye a picture not to be equalled by Dutch or Flemish school.

In other respects the peasant of the lagoons aims at an inferior standard of luxury. His house is by far the finest portion of his possessions. The style of furniture, though comfortable, is inferior; and in the matters of dress and food the most primitive theories evidently prevail. Here, however, as in most other parts of Europe, we behold the extremities, as it were, of two systems—the one which is going out of date, and the one which is coming in. Much bigotry is no doubt often displayed in the attachment of some persons to old habits and customs, not otherwise valuable or respectable than from their mere antiquity; but in several parts of Italy the advocates of novelty are seldom in possession of so much comfort as they who abide by the habits and customs of their forefathers. These for the most part are content with the coarse manufactures of the country, which, rough and uncouth in appearance, supply the requisite warmth, and are extremely enduring. On the other hand, the imported goods within the reach of the poor, though gay, and of brilliant colours, are too often of the most flimsy texture, and melt away from about the persons of the wearers almost like vapour. The two classes of peasants view each other with secret contempt; but the old fashion is rapidly dying out because it is old, while the new chiefly triumphs perhaps because it is new.

A native, when questioned on the subject of the recent innovations, observed that the lower classes of the population would have the means of providing for their necessities if they were not so eager after luxuries. The females are given to expensive dress, which deprives them of the means of supplying themselves with more necessary articles. The gluttony of the artisans has become proverbial amongst us: what is not spent in finery in dress is consumed in pampering the appetite. In consequence of the prosperity of the straw trade, which lasted from 1818 to 1825, luxury spread throughout the country; and it would excite a smile, were it not a subject for regret, to observe the country-folks in embroidered stockings and pumps, with large velvet bonnets trimmed with feathers and lace; but in their homes they, as well as the artisans in the town, are miserably off; and they who are even genteelly dressed when abroad, have rarely more than a miserable palliasse for a bed at home. Deprived of the advantages of the straw trade, the situation of the country-people, especially those of the mountainous parts, is very distressing.

But this and similar causes operate much less on the population in the district of the lagoons than elsewhere; and indeed it may almost be said that these persons for the most part offer a striking contrast with their neighbours. Notwithstanding the nature of the vapours by which the air they breathe is impregnated, they are said, upon the whole, to be healthy and long-lived; and their regularity of employment, the goodness of their wages, and their constant residence on the same spot, with many other causes, combine to render them one of the most thriving sections of the Tuscan population. It must, nevertheless, be admitted that we want several data for correctly appreciating their condition, and these could only be supplied by one who should remain a long time among them. The owners and conductors of the works are too much absorbed by the love of gain to pay much attention to the state of the labourers, who, as in most other parts of Italy, lead a retired life, and are reserved and shy of communicating with strangers. On ordinary topics they will converse with you freely enough, but the moment you allude to their domestic concerns, they shrink into themselves, and decline entering into explanations. This, however, they usually do in the most civil manner, affecting stupidity, and carefully avoiding the least appearance of rudeness. Even in the neighbouring towns and villages, the labourers of the lagoons are little known; and the produce of their manufacture, though exported to France and England, attracts little notice to the country itself,

except among those who are engaged in its production. This will account for the very little that is popularly known of the borax lagoons of Tuscany, or of the race of peasants by whom they are rendered profitable.

WORDSWORTH AND HIS POETRY.

Among the poets, as well as other literary characters of the last twenty years, death has vindicated his vocation. Within that term the public has lost Scott, Hogg, Crabbe, Lamb, Coleridge, Southey, Campbell, Barton, Elliott, Bowles, and Wordsworth. Moore remains in a very precarious state of health; Rogers and Montgomery—the former at eighty-eight, and the latter at seventy-nine—are still living and well, but, from their advanced years, naturally approaching fast the term at which the destined return of humanity to its primary elements is inexorably assigned by the covenant of existence. Wordsworth died at Mount Rydal, his residence, near the head of Windermere Lake, on the 23d of April last, after an indisposition of considerable duration. He had just entered upon his eighty-first year, having been born on the 7th of April 1770 at Cocker-mouth in Cumberland, where his parents resided, respectable persons of the middle class of society.

When young Wordsworth was old enough for instruction in the dead languages, he was placed at Hawkeshead grammar-school, then under the mastership of Dr Wordsworth, a relation of his family. He was distinguished for attention to his duties, and was observed to be very partial to the study of the classics. He wrote verses at an early age. When a youth of eighteen or nineteen, he produced a poem entitled 'An Evening Walk, Addressed to a Young Lady,' which appears in his published works. In 1793, soon after he had graduated at St John's College, Oxford, he committed to the press 'Sketches in Verse taken during a Pedestrian Tour through the French, Swiss, and Italian Alps.' These pieces, though deficient somewhat in harmony, showed strength, a command of vivid imagery, which, if not well defined in outline, was full of warmth, and breathed the true spirit of poetry. This undefinedness belonged rather to that tendency to generalise which is often found in young writers, than to peculiarity of diction. In this regard no one was ever freer from error than Wordsworth, his fault lying rather in an opposite direction, and his style being remarkable for simplicity, sometimes even to meagreness.

In 1797 Wordsworth went with a favourite sister into Somersetshire, where he became a sojourner about two miles from Coleridge, who lodged at Nether Stowey. The name of his residence was Alfoxton, and it was there that the first interview between the two poets took place. Alfoxton was an old house amid the Quantock Hills. It was surrounded by tranquil and delightful scenery. It belonged to a gentleman, then a minor, named St Aubyn. Here, almost from the time he left the university until he went to his permanent residence among the English lakes, he continued to reside. He paid, indeed, a short visit to Germany during that time in company with his sister and Coleridge. He visited Klopstock at Altona, and was the only one of the party who could converse with the venerable German, Coleridge not speaking, and scarcely able to read, French then or afterwards, and though reading German, by no means able to use it in conversation. Wordsworth, therefore, then young and enthusiastic, had the conversation with the aged and feeble poet wholly to himself. This excursion to Germany was principally confined to the Hartz Mountains, and to their immediate vicinity. A year in France, and a sojourn some short time in Dorsetshire, comprised the whole of the movements of Wordsworth until he settled down finally among his native mountains.

It was at Alfoxton that Wordsworth's peculiar ideas respecting poetry seem to have been developed, and there he put them into practice in his first edition of the

'Lyrical Ballads.' It is said, on the authority of Coleridge, that the idea was started after several conversations between himself and Wordsworth, that by way of experiment, a series of poems might be composed of two kinds. In one portion the incidents and agents were to be partly supernatural, and the affections were to be interested by the dramatic truth of the emotions that would result from such circumstances, supposing them real. In the other, subjects were to be rigidly selected from common life, in regard to incident and character. Coleridge was to direct his attention to the former, the supernatural or romantic part of the undertaking, and Wordsworth was to endeavour to give novelty and interest to common things, and excite the feelings, by leading the mind from customary views to those familiar objects of which mankind in general did not seem to have a right apprehension or feeling. Coleridge was notoriously idle, and went to work slowly, having only written his 'Ancient Mariner,' and planned the 'Dark Ladie' and 'Christabel' in his mind, before Wordsworth had produced a number of compositions for his part of the work, somewhat heterogeneous, but composing the volume called the 'Lyrical Ballads,' the second edition of which, in two volumes, contained a preface of considerable length by Wordsworth, explanatory of the design, and contending for the extension of that style of poetry. He was, in short, for rejecting all phrases and forms of style not included in the language of 'real' life. This dogma, positively advanced, was to be his own guide, and the only guide he would permit to others, whom he summoned to pay due allegiance to its rules. It was not a reform in poetical diction for which alone he contended—he would have the language to be really that of the subject or object concerned, even of the lowest rustic life; and yet in his 'Lyrical Ballads,' designed to realise this idea, he did not himself use the words which the persons he describes would have used, and he therefore outraged his own theory. He thus differed wholly from the great Bacon, who says that poetry accommodates the shows of things to the desires of the mind; in other words, uplifts us in our expectations, its very essence being to give us those gratifications in fancy which reality denies. It is not the verisimilitude in description of what all see that is enough for poetry. Wordsworth contended that the 'real' language, which is nowhere to be found the same in two districts of any land, should be for standard use. He did not, because he could not, adopt it himself. The language of cultivated society does not differ from the best of our prose writers more than Wordsworth's own language did from that of the persons introduced into his writings. He asserted, too, that there 'neither is, nor can be, any essential difference between the language of prose and metrical composition.' This it is as difficult to reconcile with truth as the former dogma, and without something better than mere assertion, we can hardly assent to the sacrifice it demands of almost all the past poetry of England. Surely if reading and talking exhibit essential differences of language, poetry and prose may be allowed to do so. In poetry we travel from the realm of fact into that of imagination; and there is a certain fitness of language adopted in one which in the other would be out of place.

There was a singular tenacity in his adhering to a theory, of which his own efforts should have convinced him of the impracticability. He seemed to have had a morbid feeling of disappointment at his failure in establishing the doctrine with which he set out in his poetical career. He afterwards lived in the pride of his own solitude; and intermingling with lowly phrase and homeliness of subject beautiful thoughts and feelings that did honour both to his heart and fancy, he became a poetical exclusive. Milton he was inclined to admit to his Lake-feast, but scarcely any other poet; and to Milton he would sometimes compare himself, and tread beneath his feet all the other sons of Parnassus. There was something Quixotic in his personal appearance, and in his stately, tall contour. His

countenance was saturnine, calm, contemplative, and good. His features were of the better order, speaking after Lavater. His smile was pleasing, and he had a sonorous voice, which told well when he repeated his own poetry, which he did with excellent effect. He was a sincere lover of truth; his superiority to complying men of the worldly stamp was seen at the first glance. At certain times his appearance had more of originality about it than at others. Many years ago he might have been met, in his solitary rambles about the country, in a huge, broad-brimmed beaver, a gray russet jacket, and pantaloons or trousers of the same, his gait somewhat pompous, and indicative of a mind above the common reflected in the outer man. His spirit was pure and benevolent, abstracted from the customary objects of people in general, and given up to nature in its calmest as well as in its more beautiful and terrible aspects; so that the commonest weed, or the lowliest things of nature or humanity, were really to him of equal interest with the sublimer objects of the elemental universe.

There was, it is true, little virtue in his contempt for all but his own notions of poetry: a species of egotism unworthy of his genius. By him the poets of the last century, and almost all of the preceding centuries, were disclaimed: Chaucer and Milton he could tolerate. It is doubtful if he comprehended Spenser, and whether he had not even a contempt for him; and it has been said by some that he had little sympathy with Shakspeare. Dryden and Pope were out of his pale of endurance; nor did he spare his cotemporaries high or low. This feeling may be illustrated by an anecdote of his treatment of James Hogg, whose peasant origin and vernacular idiom might have served for Wordsworth's own 'Michael the Shepherd.' Hogg being at Mount Rydal, where Professor Wilson, Lloyd, and some other literary men were then, all of them were admiring a beautiful nocturnal arch, when Hogg said, 'Hoot, it is neither mair nor less than just a triumphal arch, raised in honour of the meeting of the poets.' Wilson exclaimed, 'Eh—eh—not amiss!' But Wordsworth, turning round, and addressing one of the party near him, said, 'Poets! what does the fellow mean? Where are they?'

To resume: the next publication of Wordsworth consisted of some poems, which came to a second edition in 1815. In the year 1809 he wandered out of his way to no purpose in writing a political pamphlet to arouse public feeling against France. This bore the title of 'Relations of Great Britain, Spain, and Portugal to each Other.' It was little noticed. In 1814 the first part of the 'Excursion,' a poem descriptive of country associations, appeared, which proved a failure, falling almost stillborn from the press. There were great expectations raised about this poem, but there was not sterling metal sufficient to balance the weight of alloy it contained. The characters were destitute of all interest, rustic in everything, and where the author's own beauties gleamed through, the breaks were few and far between. It was observed by a writer of genius who knew the author, that 'the effect was like being ushered into a stately hall, and invited to sit down to a splendid banquet in the company of clowns, and with nothing but successive courses of Norfolk dumplings served up.' Wordsworth, disdaining any lesson from the experience of the past in carrying out his theory, and in attempting to prove that the more interesting parts of the best poems are strictly but the language of prose, felt disappointed at this want of success. Still, while the phraseology he adopted was not the 'real' language used in life, as he intended it should be, adding great simplicity to clearness of expression in his poems, he so far did good by his example; while in other senses his efforts tended to repress rather than extend that ideal attraction which has ever been considered the charm of poetry.

In 1815 Wordsworth published the 'White Doe of Rylstone,' followed by 'Peter Bell,' 'The Wagoner,' and 'Sonnets to the River Duddon.' Other poems appeared subsequently. In these the poet did not abandon an

iota of his theory. There were more of his better thoughts in them, all partaking of that character of 'association' of which he may be called the poet. This is the true attraction to his admirers, and not the attempt at realising what he alone fancied possible. His love of nature was intense in its broad features and most expansive character, as well as in its details, but the wider field was most congenial to his muse. His homely thoughts and minutenesses were out of keeping with his depth of thought, like flies in the surrounding amber.

Wordsworth, living near his birthplace in the country of his family and its alliances, drew Coleridge out of Somersetshire in the same direction, and Coleridge attracted Southey. The latter had no opinion in common with Wordsworth in respect to his poetical theory. These two poets had a natural distaste for each other, which they did not conquer till 1815. Southey neither thought deeply nor comprehensively enough to suit Wordsworth, and the proud dogmatism of the latter, his want of affability, and haughty bearing, were more than Southey could tolerate. Wordsworth at first resided at Grassmere, whence he removed to Rydal Mount near Ambleside; Southey and Coleridge were at Grata, thirteen miles distant; Charles Lloyd lived at Brathay, not far off; and Dr Watson, bishop of Llandaff, at Calgarth.

Wordsworth, while at Grassmere, wrote a paper for Coleridge, who was then publishing 'The Friend,' *On the Principles Concerned in the Composition of Epitaphs*, which was excellent of its kind. He had received early, through the interest of the Earl of Lonsdale, the appointment of distributor of stamps for the counties of Cumberland and Westmoreland, a lucrative post; and upon the death of Southey he was crowned with the anomalous laurel. In consequence, and as in duty bound, he wrote an *Ode to the Queen* on her visit to Cambridge; but, like all other effusions of the same character, it has little merit or likelihood. He married Miss M. Hutchinson of Penrith in 1803, by whom he had issue. A daughter preceded him to the grave not a great while ago.

The poet's life being spent, not in the way of the world, but in the heart of the lake country, apparently unemployed, he might have observed on those who censured his retired life, as a brother poet who preceded him did—'How various his employments whom the world calls idle!' He climbed the mountains and threaded the valleys of the north, to admire, love, and venerate a thousand attendant beauties which common observers never perceive, to build upon them lofty ideas, or to associate them with the deep things of the heart, and multiply their images. He had no preference for what the world esteems its best pursuits: he thought them vanity. He was a lover of solitude, because the deeply-thinking spirits of all time have loved it—those who could smile at low ambition, and ask no favour of a monarch but to stand out of the sunshine. He could not, with the common flock, follow the leader's bell. Simple feelings, however, described in homely language, are within the colloquial range of the common race of mortals; and hence Wordsworth, while estimated by a few for the beauty of the thoughts scattered up and down among his household truths, is read by more because his language is within the compass of the lowest stamp of intellect. But he expected more praise, a more extended command of homage, than he received; and while disdaining show and external aid, while rearing his fabric upon the basis of humanity, he was unreasonable enough to imagine that the multitude, which vegetate only upon the tinsel and glitter of appearances, would make an idol of him who disdained their idols. His muse knew none of those things, because he looked only to what existed in the simplicity of our humanity, as well as in nature divested of extrinsic garb. To him the mountain daisy, for example, was a source of poetic inspiration—not for its own sake only, but as a peg upon which to hang a tale that the poet had lost a sailor

brother who was fond of daisies, and when he came on shore, admired them. He was drowned, and the daisy was to 'sleep and wake' upon his grave. This occupies seventy lines, not marked by brilliance of imagery, or depth of thought, or novelty, or aught of pathos; but merely by simplicity. The comparison of this poem with Burns's 'Mountain Daisy' will show what is intended by this remark—namely, the peculiarity of Wordsworth's levelling system of poetry, the language of which, he contended erroneously, differed nothing from prose. Burns keeps to his subject in the natural order of things; and if he alludes to aught besides, the allusion is in the way of comparison, or secondary to the object addressed. There can be no question which of the two poems is most touching.

Wordsworth is not, in strictness, the descriptive poet of nature; but he draws from nature the ground of the associations which strike him, and which he dresses up for his purposes in accordance with his peculiar doctrines. He is the Crusoe of his own region of musings, the solitary who discourses with himself, and records, not that which may be most meet to affect others, but that which his own source of inspiration incontinently pours forth, and of which he expects others to feel the force like himself: nor does he regard whether his theme be high or low, mean or lofty. He asks nothing, and affects to give nothing derived from external pomp, and that which the world calls 'great'; but he seeks rather that which is innately so, taking no bias from received opinions, which he feels are as often false as true. He is proud of showing that in his view the vulgarest things are really great and interesting; rendered vulgar by habit, but in reality possessing beauty, which he is happy to draw out to the light of day, or to elevate by association. With him all past ideas in connection with poetry are to be discarded—all inherited predilections, all learning and the arts, all the predispositions and superstitions, and vested rights, and pomp and circumstance inherent in it through bygone days. The era of his school is to commence anew from the root of the poetic art. A beaker must be swallowed of the water of Lethe in regard to all but the new theory, and there must be a hecatomb of the poets of all ages, offered up by his disciples, out of the ashes of which is to arise the verse true alone to nature—the enduring perfect edifice of plain Tuscan, made contemporaneous with existing things. No graceful foliage is to decorate the capitals of his columns, not a volute nor a metope; in other words, of the five orders, four are to be rejected for their refinement's sake. He will have nothing but himself. All must flow from his own invention; and when the subject is unworthy of his own genius, he will raise it to the common level; but this must be his own work. Thus any subject within the scope of observation may be rendered fit for the object intended. The arid soil may be rendered fruitful, and the Saharan desert rich with wholesome vegetation. But there is to be no aggrandisement, no accommodating the shows of things to elevated or exaggerated ideas. The roses of Pæstum are not to breathe more fragrance than the dog-rose, nor are the eyes of the lover's mistress to be more bright and beaming in verse than in reality. The 'line' chosen thus by the poet is of course in his own taste, and would not be questioned, but that he would have it be the law for others. It was this spirit, generated by wounded pride, and the feeling—though he was sustained by more friends in the press, acting continually upon the public mind in his behalf, than any poet ever had before—that he was not where his ambition placed him: it was this spirit which probably carried him farther than he would otherwise have gone in the upholding the rules he laid down in poetry.

These rules were not assented to by his friends. Coleridge has left a record of his difference of opinion with Wordsworth about them. Southey declared openly that they were erroneous. Those opponent opinions, and the failure of 'The Excursion,' seem to have made the poet resile upon himself; cherish the solitary re-

veries that strengthened the exercise of his system, out of the feeling that his views were undervalued in their merits; not considering the gigantic character of the change he was attempting to effect, and how very slowly the best innovations are received by the public. He had imagined, too, that the general heart beat responsive to his own, while in the existing artificial state of society the minds of men had become less and less responsive to nature's truth. The wild rock, the rugged glen, the misty mountain, the aerial lark, the seasons, the shattered oak, the wild down, the ragged beggar, the storm and its ravage, down to the very weed which grows beneath the mouldering wall—all these, however interesting and valued by the poet, are disdained by the world of bustle and petty contention. It can see nothing in such objects—they are 'foolishness to the Greek.' It is among those alone who dwell in the bosom of nature, who live as Wordsworth lived, and think and feel as he thought and felt, that he will be duly estimated, let others pretend or affect to understand him as they may. Wordsworth, therefore, can never be a popular poet. He possesses none of the attraction upon which popularity is founded. He is too plain, tedious, and unexciting, or else too deep and philosophic. There were evidently two periods in the style of his poetry, in neither of which did he carry out fully his own principles. His later style is evidently a change towards that which he condemned. It is classical, polished, sober in colour, sweet, and well finished. C. R.

[Agreeing with C. R. in the general estimate he has given of Wordsworth and his poetry, we think that there is one thing overlooked, or not rightly seen—the personal feelings of the poet as represented in his verse. To us it seems that the peculiarity which most distinguishes Wordsworth from other poets is his deficiency in genial feeling as an individual man. In him, we have been assured by his associates, the quality called kindness of heart scarcely appeared, even where it might have been most expected. In dealing regarding his writings, a spirit was generally shown very unlike what might have been expected of one who seemed to have given up the common pursuits of the world. He was also, as is well known, exceedingly vain and egotistical in his social appearances. In these features of his personal character we read the grand defect of his verse—heart. The whole show is intellectual: it excites not a tear, scarcely moves a sigh. We believe that it is for this reason mainly that it can never be widely popular. It is instructive to find such a man distinguishing himself by flying to solitude—a field of existence where egotism may be indulged, but which in its very nature precludes true, that is active, benevolence. We must deem it somewhat strange that the fact of the hermit-tendency being essentially a selfish one, has not yet been generally seen and acknowledged.—Ed.]

EMIGRATION NOTES.

NO. I.

EMIGRATION to the colonies, and also to the United States, goes on this year with increasing speed. Numbers who never thought of quitting home are now on the move, and with good hopes of success. New Zealand and Port-Philip—the latter now to be called Victoria—seem to be growing in favour, and to one or other of these settlements our own feelings would incline; preference probably being given to New Zealand, as most suitable in point of character—most like dear Old England.

Among the schemes proposed to aid the emigration of parties straitened for want of means, are several for furnishing loans by societies of capitalists. One of these plans—by Mr Frederick Hill, we believe—consists in establishing a joint-stock company, to lend small sums to emigrants on their personal security; the loans to be repaid when the borrower has realised means in the new scene of labour to which he has

transferred himself. The company is to charge such interest for the loans as will induce capitalists to subscribe to the funds. We fear that this scheme proceeds on too favourable an idea of human nature. When a loan is to be made, it is usually deemed necessary that the lender should have not merely grounds of faith in the borrower's honesty, but some security against an opposite contingency and the common accidents of fortune. In the present case, even legal recourse, in the event of a failure to repay, is wanting, for the attempt either to discover the whereabouts of the individual, or to prosecute him if found, would be ridiculous.

A somewhat more hopeful scheme is that suggested by Mr Wyndham Harding in a late number of the 'Spectator.' It is said to be similar to a plan already carried out to some extent by that untiring friend of emigrants, Mrs Chisholm. To quote from the paper in question—'It is called "The Family Colonisation Loan Society," and relies entirely on the family tie. The working is this:—A number of families, say, for example, five, wishing to emigrate, and knowing each other, form themselves into "a group," and come to the society with all the money they can scrape together. The society lend them as much more, taking the joint and several security of one or more of each family. By this means the first batch are shipped off; the remaining number of the families staying behind in pledge, as it were. As soon as satisfactory advices are received from the colony of the first batch of emigrants, and a part of the society's loan is repaid by them out of their earnings, a second batch is sent out, the rest still remaining behind in pledge; and so on, until the last remaining portion of the group are despatched.'

'From careful calculations, which have been revised by Mr Neison the actuary, a whole group of five families, which can get together on the average £112 a family, may be got out to Australia in this way in three batches, and in three years at most; the society only risking their loan to the first batch of emigrants. This is the plan, and it is in actual working. Eighty families are forming themselves into groups; they are prepared with £1260 of their own money; and if the society meet with the support it probably will, the first batch will sail in June. The experiment of self-supporting emigration which you have so often advocated is now about to be made, and that under the wise and gentle guidance of Mrs Chisholm, assisted by men of such character and ability as Mr Vernon Smith, Lord Ashley, Mr Monsell, Mr Tidd Pratt, and Mr Neison. On Saturday last (May 4), the first band of intending emigrants mustered at Mrs Chisholm's, and were addressed by Mr Vernon Smith and Lord Ashley. The feature of the Family Loan Society is, that as people help themselves, and no further, does the society help them.'

We like this plan of Mrs Chisholm's much better than any other which has come under our notice. Still, we think it susceptible of improvement. We quite agree with Mr Hill in thinking that any plan, to be of permanent and general application, must rest on the commercial principle. In a word, the exporting of emigrants must be a matter of trade, on the ordinary calculations of profit. Keeping this principle in view, we can see no reason for confining the security for loans to family relationship. The society would indeed require to be composed of persons mutually acquainted, and thoroughly assured of each other's integrity. Members of the same religious congregation, for example, might have a good chance of striking out a practicable scheme for mutual benefit. We merely, however, throw out these hints for consideration. Unfortunately, the classes best adapted for emigration have little reliance on the integrity of each other—a circumstance often fatal to schemes of mutual improvement in which money is concerned. An instance of this consciousness of insecurity came lately under our notice. We were waited on by six individuals belonging to the operative class in Edinburgh. They wished to save and lay aside

money by instalments for the purpose of emigrating in a body. They could not save as individuals, because they would constantly feel a craving to break on the money they had collected; and they could not venture to club their savings, as they must necessarily repose confidence in one of their number. Placed in this dilemma, they wished us to take entire charge of the fund, and give it up to them at a certain time when they came in a body. We entered on the trust; the parties paid in their savings regularly; and when the required sum was collected, the depositors unitedly reclaimed it, and, as we believe, emigrated to Canada. This little incident affords a melancholy insight into the condition of the working-classes, who, for want of mutual co-operation in money matters, let slip a thousand opportunities of improving their position and circumstances.

It seems tolerably evident that, after all that loan societies can effect, emigration on a general scale must depend on individual earnings and self-denial. With reasonably steady employment, and emigration as a clear and definite object set before him, the mechanic, ploughman, shepherd, or any other member of the industrious orders, has only himself to blame if he realise not the means of transporting himself and family to even the most distant of our colonial possessions, in almost any one of which there is, with industry and self-denial, 'a world to be had for the winning.'

According to late accounts, emigrants of all classes, on arriving in New York, are exposed to serious imposition and annoyance from persons who waylay them on pretence of rendering advice and assistance. An English gentleman, who gives his name, has written to the editor of the 'Times' on the subject, and his account of affairs on landing is so important to intending emigrants, that we transcribe it into our pages:—

'I arrived last week by one of the London liners, having 178 steerage and twenty cabin passengers on board. As soon as the health officer had left the ship, we were boarded by a swarm of touters for the various boarding and conveyance houses, steam-boats, and railways, and a scene ensued which defies description. The violent behaviour, foul language, and contradictory statements of these men quite bewildered the unfortunate emigrants; and their confusion was complete when, on reaching the wharf, a crowd of carmen and porters joined the throng of "runners." It was almost impossible for even the cabin passengers to free themselves from the importunities of these men, and had I not received the greatest assistance from the officers of the ship and the custom-house (of whose courtesy I cannot speak too highly), I am certain my own luggage would never have reached the truck in safety, the ships between us and the wharf, as well as the wharf itself, being crowded with persons of the lowest class and character. Of the subsequent fate of the majority of the emigrants I cannot speak from observation (though I am informed that they are generally plundered most cruelly); but for the following I can vouch, having been the means of exposing and preventing the imposition:—A gentleman proceeding to the Western States with his family, was charged L.5, 11s. for the cartage of his goods from the ship to the canal boat (less than two miles), the same things having been removed from the Regent's Park to the London Docks for 30s. This claim was enforced with such violence, and accompanied by such threats, that it was with difficulty I persuaded the parties concerned to allow me to take the responsibility on myself, and bring the man before the police authorities. On doing so, his claim was reduced to L.2, 10s.; but I am threatened with personal vengeance and a legal process for the recovery of the whole amount, and was subjected to such insult and threats (even in the police-office), as would, I am certain, have deterred many people from carrying the matter out. I may add, that another fellow-passenger, with but little luggage, which was not removed a mile, was charged L.1, 7s., which was reduced in the same

way to 5s. 6d. There is an excellent society here, supported by the principal merchants, which supplies every information gratis to emigrants proceeding to all parts, and endeavours to obtain them employment; it is named "The British Protective Emigrant Society;" but it is out of its power to assist the greater part of those who most need its assistance. Other societies imitate its circulars, &c. and the runners of course do all they can in their power to prevent emigrants from applying there at all. To the secretary, Mr C. H. Webb, I am much indebted for his courtesy and information, and have learned from him that not one of the 200 persons who accompanied me from England had found his way to the office of the society.'

A CHIP FROM A SAILOR'S LOG.

It was a dead calm—not a breath of air—the sails flapped idly against the masts; the helm had lost its power, and the ship turned her head how and where she liked. The heat was intense, so much so, that the chief mate had told the boatswain to keep the watch out of the sun; but the watch below found it too warm to sleep, and were tormented with thirst, which they could not gratify till the water was served out. They had drunk all the previous day's allowance; and now that their scuttle butt was dry, there was nothing left for them but endurance. Some of the seamen had congregated on the top-gallant fore-castle, where they gazed on the clear blue water with longing eyes.

'How cool and clear it looks,' said a tall, powerful young seaman; 'I don't think there are many sharks about: what do you say for a bath, lads?'

'That for the sharks!' burst almost simultaneously from the parched lips of the group: 'we'll have a jolly good bath when the second mate goes in to dinner.' In about half an hour the dinner-bell rang. The boatswain took charge of the deck; some twenty sailors were now stripped, except a pair of light duck trousers; among the rest was a tall, powerful, coast-of-Africa nigger of the name of Leigh: they used to joke him, and call him Sambo.

'You no swim to-day, Ned?' said he, addressing me. 'Feared of shark, heh? Shark nebbie bite me. Suppose I meet shark in water, I swim after him—him run like debbel.' I was tempted, and, like the rest, was soon ready. In quick succession we jumped off the spritsail yard, the black leading. We had scarcely been in the water five minutes, when some voice in-board cried out, 'A shark! a shark!' In an instant every one of the swimmers came tumbling up the ship's sides, half mad with fright, the gallant black among the rest. It was a false alarm. We felt angry with ourselves for being frightened, angry with those who had frightened us, and furious with those who had laughed at us. In another moment we were all again in the water, the black and myself swimming some distance from the ship. For two successive voyages there had been a sort of rivalry between us: each fancied that he was the best swimmer, and we were now testing our speed.

'Well done, Ned!' cried some of the sailors from the fore-castle. 'Go it, Sambo!' cried some others. We were both straining our utmost, excited by the cheers of our respective partisans. Suddenly the voice of the boatswain was heard shouting, 'A shark! a shark! Come back for God's sake!'

'Lay aft, and lower the cutter down,' then came faintly on our ear. The race instantly ceased. As yet, we only half believed what we heard, our recent fright being still fresh in our memories.

'Swim for God's sake!' cried the captain, who was now on deck: 'he has not yet seen you. The boat, if possible, will get between you and him. Strike out, lads, for God's sake!' My heart stood still: I felt weaker than a child as I gazed with horror at the dorsal fin of a large shark on the starboard quarter. Though in the water, the perspiration dropped from me like rain: the black was striking out like mad for the ship.

'Swim, Ned—swim!' cried several voices; 'they never take black when they can get white.'

I did swim, and that desperately: the water foamed past me. I soon breasted the black, but could not head him. We both strained every nerve to be first, for we each fancied the last man would be taken. Yet we scarcely seemed to move: the ship appeared as far as ever from us. We were both powerful swimmers, and both of us swam in the French way called *la brasse*, or hand over hand in English. There was something the matter with the boat's falls, and they could not lower her.

'He sees you now!' was shouted; 'he is after you!' Oh the agony of that moment! I thought of everything at the same instant, at least so it seemed to me then. Scenes long forgotten rushed through my brain with the rapidity of lightning, yet in the midst of this I was striking out madly for the ship. Each moment I fancied I could feel the pilot-fish touching me, and I almost screamed with agony. We were now not ten yards from the ship: fifty ropes were thrown to us; but, as if by mutual instinct, we swam for the same.

'Hurra! they are saved!—they are alongside!' was shouted by the eager crew. We both grasped the rope at the same time: a slight struggle ensued: I had the highest hold. Regardless of everything but my own safety, I placed my feet on the black's shoulders, scrambled up the side, and fell exhausted on the deck. The negro followed roaring with pain, for the shark had taken away part of his heel. Since then, I have never bathed at sea; nor, I believe, has Sambo been ever heard again to assert that he would swim after a shark if he met one in the water.

MUSICAL INSECTS *versus* MUSICAL FISHES.

'*Cabramatta*, or *Cabra*-pool, is the appropriate and descriptive name of a chain of ponds abounding with the *cabra*, an insect of the *teredo* family, resembling in appearance the contents of a marrow-bone, which insinuates itself into the hardest timber under the water, and of which the aborigines make many a delicious meal.'—*Lang's New South Wales*. Respecting this *cabra*, a settler from New South Wales relates that in crossing the — river one evening he heard a musical sound, as of a piano or Æolian harp: starting to hear such a sound there, he said to the boatman, 'Do you hear that music—who keeps a piano over there?' The boatman rested on his oars, when the musical sounds were more distinctly heard, and he being familiar with them, said it was the *cabra* in the dockyard, a passenger at the same time remarking that the *cabra* must have got into the boat, the sounds were so distinct. On quiet evenings, at the water-side, the settler in New South Wales has heard these musical sounds issuing from the water; and what an interesting piece of nature's music is this wherewith the future Australian lyre may connect a thousand beautiful associations! It may perhaps be asked if this is not another explanation of the idea of musical fishes, as mentioned in an article in 'Chambers's Edinburgh Journal,' vol. vii., new series, p. 207? The *cabra* is supposed to cause these musical sounds in the process of boring. This is not unnatural nor unlikely; there are other instances of diminutive animals and insects causing considerable sounds and noises by the natural processes of boring, digging, flying, &c. The *death-watch*, when it gets into an old-timbered house, will sometimes keep up in a room a loud and incessant ticking; and when the insects are numerous, the ticking will proceed from several different parts of the room at the same time. Heber, in his journal in India, mentions a species of *death-watch* whose sounds resemble the bubbling of water:—'In my cabin there was a noise exactly like the bubbling up of water through a narrow crevice. On inquiry, I was told that it was a sort of cricket, or Indian *death-watch*, which always emitted this sound.'—*From a correspondent*.

THE WISE PERSIAN.

Murad Achmet Alec was the only man I ever heard of who fully appreciated the contingency of not being always able to find himself. Murad resided in a distant country place, but not so distant as to prevent his coming to Ispahan at least once every year. The Persians are reputed to

be a quick-witted generation, but whether Murad had the misfortune to be in advance of his age, or behind his age, I really cannot take it on me to determine; this alone I dare certify, that quickness of parts was never laid to the charge of Murad Achmet Alec. To Ispahan, however, Murad came; and on the very first night he passed in the capital, he was unlucky enough to lose a valuable ass on which he was accustomed to ride. At break of day (having discovered his loss) Murad appeared in the principal bazaar, crying out—'My ass is lost! Alas! my ass is lost! Blessings on protecting Allah, I was not on its back! for in that case, oh men of Ispahan! should I not myself have been lost also?'—*Dublin University Magazine*.

THE DREAM.

WHEN night's sable wing shades the hour of repose,
And the bright stars of heaven are watching the earth,
And Fancy a pilgrim to Fairyland goes,
To give to her brightest creations their birth:
I dreamt that I roamed in a far-distant land,
Where the orange-tree grows, and the green myrtle waves,
And bright pearls are strewn on the gold-coloured strand,
Whilst the purest of gems star its emerald caves.

In the evergreen bowers of that Orient clime—
Most gorgeous in plumage, and lovely in song—
Were golden-winged birds whose sweet voices kept time
To the voice of the waters that murmured along.
Every bright hue that rainbow or sunset has shown,
Every perfume the light wings of Zephyr can bear,
Every sweet tone that music can claim as its own,
In the fulness and freshness of beauty were there!

These stole o'er the sense like the balm of the rose,
Or the bulbul's sweet song when his own love he sings,
But no one was there to whom hearts might disclose
The emotions called forth by such beautiful things.
And I felt that in Paradise bliss might not be,
If Love did not form its most exquisite flower,
But on earth every spot were celestial to me,
If my Mary were there to lend joy to the hour.

J. C.

SCANDINAVIAN SUPERSTITIONS.

The whole race of *Underground People*, the dwarfs excepted, live chiefly by grazing cattle. When the sheplings are deserted by their human brethren at harvest-time, they move over to them. Whole troops of these little gray men may often be seen at night-time employed in their pastoral avocations, driving before them numerous herds of cattle, while the females of the race carry milk-pails upon their heads, and children in their arms. To assist them in guarding their flocks, they have black dogs, which in Telemak are called *Huddebikiar*—that is, cattle-keepers. They live, moreover, in much splendour within the hills and mountain-tops, having fine houses, rich furniture, vessels, and other articles of silver, and, what seems strangest of all, they possess churches. In almost every point they resemble mankind; they are exceedingly social amongst each other, and hold good living in very Christian-like estimation. Yule-tide is a time of high festival with them. They marry, moreover, and are given in marriage, and celebrate their weddings in high style, especially if the bride happens to have been abducted from the earth—a little peccadillo to which they are much inclined. On these occasions they invite their friends to the bridal, which always takes place upon a Thursday, and about the hour of midnight, when they set out for church with mirth and music. We are told how a peasant from the west once fell in with a procession of this kind, and, but for his prudence, had, like Tom of Coventry, paid dearly for his peeping; for the deceitful bride took the wreath from her head, and held it out to him with a smile that it was no easy matter to resist. Fortunately for him his fears were too much for his passion, and he thus escaped being carried off by the elves, which would infallibly have been the case had he yielded to the temptation.—*St James's Magazine*.

MODERN MYTHS.

We have a pleasant and intelligent younger brother rejoicing in the title of 'NOTES AND QUERIES,' to whom one may send a question on any mysterious or difficult point in literature, with the certainty, or all but certainty, that his ensuing number or the next again will contain an answer to it. We are among his subscribers and constant readers, and have already, in the six months of his existence, added immensely by his means to our stock of knowledge. It is only to be regretted that 'Notes and Queries' takes a somewhat narrow field of operations, confining his attention mainly to literary and historical matters—as, for instance, the source of the well-known proverbial couplet,

'He that fights and runs away,
May live to fight another day'—

or the author of the equally well-known saying, 'Let me make a nation's ballads, who will may make its laws'—or 'the reason why the nine of Diamonds is called the Curse of Scotland.' We should like to see him taking a wider range, because there are some profoundly abstruse questions, of neither a literary nor a historical character, on which light is not less desirable.

Ever since we were very little children, and more particularly then than now, we have heard of a personage called the Pig-faced Lady—a wonderful personage, the daughter of a man of large fortune, highly accomplished, and of the most amiable dispositions, but who, having unfortunately been born with a head and face like a pig, was necessarily sequestered from society. It was understood that this lady had every elegance furnished to her—she ate her food out of a silver, if not a gold trough—a human physiognomy, however plain of its kind, was the sole thing wanting to render her situation in life enviable. She lived in certain apartments of a magnificent house, attended by a set of servants, none of whom, however, ever saw her face, as she studiously concealed it under a thick veil. Her father, having no other child to whom he might leave his fortune, was anxious to see her married; but the difficulty raised to this by her monstrosity of aspect was very great, and it was considered doubtful if a suitable swain would ever be found. Now we want to know who this Pig-faced Lady was. Who were her parents? Where did she live? When did she live? Did she ever meet a youth willing to accept her as his wife? Was she ever really married? Was her fortune paid? And did the match turn out well? Has she ever been heard of as an old lady? Supposing that no one can answer these questions any more than ourselves, will some 'oldest inhabitant' of this great island inform us if he heard of the Pig-faced Lady in his youth, as we have heard of her in ours? Perhaps some gentle-

man not so very old can tell when the Pig-faced Lady was for the first time heard of. If so, let him communicate all besides that he knows about her. Let us have a biography of the Pig-faced Lady if possible.

There is another person of interesting character, of whom we did not hear till a much more recent period. This was the gentleman of large fortune who was understood to go about the country as a player on the bagpipes for a wager. He was, as we all know, to do so for three years, wearing the usual garb of a strolling musician, or else forfeit a large sum which he had staked. We never chanced to see the gentleman; but we heard that he now and then turned up in one of the minor towns, to the great admiration of the worthy inhabitants, especially those of the more impressionable sex. A tall handsome figure he was, with the unmistakable air of a gentleman shining through a mean garb. His playing was charming. Every one observed the silver ornaments on his pipes, and that he himself wore a handsome diamond ring. He only appeared in the dusk for about an hour; but when it was known who he was, he never failed to reap a rich harvest—for somehow it is far more pleasant to give to those who do not want than to those who do. It was always understood that he thereafter retired to the best hotel in town, was disrobed by his servant, and then indulged in all the luxuries which a gentleman may be understood to have a taste for. Now we should like to learn from some contributor to the 'Notes and Queries' who this mysterious gentleman was, and all about him. Was there such a gentleman at all? Was he really a man of fortune engaged in a frolic, or was he some one who found it equally profitable to assume the character? Who can testify to having ever seen him, or any person bearing the appearance? Supposing that he can be substantiated, it would be particularly obliging if any one can tell us whether he gained his bet or not, and, if he did, how much he gained by it and by his collections as a musician?

There is a remarkable person of more recent date than either of the preceding. If we remember rightly, she came into the field very soon after the Gentleman-Bagpiper ceased to be much spoken of. We allude to the lady who was to be married whenever she could exhibit a million of used postage labels. In this case we seem to make a nearer approximation to a real personage than in the other two, for we have ourselves several times been intreated for used labels by young ladies who professed to be gathering in behalf of the principal party. While this is true, there is nevertheless much obscurity about the affair, as, to the best of our recollection, no one of these fair agents ever could pretend to a personal acquaintance with the principal. She had only been asked to gather by a friend, who was herself gathering for another person, who was

gathering for another, and so on; thus placing the marriageable lady at the end of so long a vista of deputed powers, that her very existence came to be a matter of uncertainty. For anything we can tell, however, the lady of the million of labels may have lived in the next street. We may have met her, and handed her down to dinner without knowing that she was the true and genuine heroine of this extraordinary contingency. What we wish to make out is—first, her reality, her being, as the Antiquary said of the Hawes Fly, *in rerum naturâ*; second, the fact of her marriage. Did she win the battle of the stamps? Did Victoria set a million of seals upon her nuptials? If she be not a mere myth, somebody must be able to pronounce upon her and all her antecedents and belongings. Will that somebody, then, be so good as communicate to us all proper particulars—as, what led to her single blessedness being made terminable on so singular a result? What sort of person was the swain who proposed a condition so irrelative to the usual requisites of matrimony? Did the marriage take place, and turn out well? We do not know if we are entitled to push our queries any farther; but perhaps it might be as well to add the number of children, if any, merely because it may help to establish the objectivity of the lady. Anything, in short, to take her out of the mythic condition in which she now rests in our minds.

It will occur to the graver of our readers that these are questions of little or no importance in themselves, and some will be inclined to ask why we agitate them in this formal manner. We can only say, in answer, that we have always felt a painful dissatisfaction with the ignorance under which we lay regarding them, and this feeling we are naturally anxious to supersede by the pleasure of knowledge. It is really nothing to us whether the Pig-faced Lady ever breathed, or ever got married; the Lady of the Labels is equally to us in the condition of Hecuba; and so is the Gentleman-Bagpiper. But it is not of little consequence to us that we have heard hundreds of allusions made in conversation to these personages without being able to decide whether they were to be considered as realities or as myths. We do not like to be in the dark about anything, not even the most trivial. Perhaps, too, there may be some solid advantage to be gained by the decision of these questions; for, please to observe, if the persons turn out to be ideal, it will show how mythic ideas are continually arising even at this day in the midst of all our boasted lucidity of knowledge, and all our high-wrought civilisation; while, if, on the contrary, they are realities, it may be held deducible that the early tales of nations are less fabulous than the school of Niebuhr supposes. For all of these reasons, then, we launch our queries, with the most earnest solicitude for suitable and satisfactory replies.

ARTHUR LEAVESLEY,

OR THE WIFE'S TRIAL.

ONE wet and dismal November evening, a traveller might have been observed to leave the quay, where had just arrived one of the passage-boats from a little distance; for it was before the days of all-assisting steam. The passenger alluded to was of herculean stature, and had he been less closely wrapped up, might have been admired as a model of manly strength and beauty. But the rain poured in torrents, and he was enveloped in an ample Spanish cloak, while a sealskin cap was drawn closely round his face. The streets through which he had to pass were nearly deserted, and the shopkeepers, expecting little custom on such a night, were slowly beginning to shut up. A porter conveyed some luggage on a truck, beside which, avoiding the pavement, the traveller walked in silence with gigantic strides. They reached a sequestered building, large and melancholy-looking, shut out from the surrounding waste ground by lofty walls. Here the gentleman rung, and waited a short space very impatiently, as might be guessed from

his frequently stamping with one foot. At length, just as he had stretched forth his hand to ring again, a man appeared, who received within the gate the stranger's large and heavy trunk, together with a hat-box. The street-porter was then discharged, and the visitor, or inmate, or whatever he might be, followed his luggage into the building.

An hour had scarcely elapsed when he again issued forth in search of another porter with a truck; and as the man who lately served him had been resting under a neighbouring gateway, he came forward, and was again engaged, his employer not recognising him. Perhaps—indeed it seemed most likely—his thoughts and attention were too much absorbed in his own concerns. The hat-box and trunk—the latter not in the slightest degree lightened, though the man thought to himself it contained a load of a different description—were replaced on the truck, and their owner led the way to one of the newest and most genteel quarters of the city. Once or twice they met the watchmen, now engaged in their midnight rounds, with whom the passenger exchanged a courteous good-night, as he continued to stalk close by his property through the midst of the flashy streets. Arrived at the lodgings he intended to occupy, and where, it would appear, he was expected, he was promptly admitted by the landlady, and he himself assisted the porter to carry his luggage up stairs. It proved no easy task, even with the help of the owner's extraordinary strength; and when it was accomplished, and the porter was asked his fare, he boldly required at least double what he was entitled to. His employer was about to demur, but the fellow casting a significant glance towards the heavy load just deposited, the gentleman at once paid the demand. The man, it ought to be said, had only ventured an experiment, as many of his class are accustomed to do; and having succeeded beyond his hopes, his tone changed to profound respect, as, thanking the donor, he muttered something about the lateness of the hour and the state of the weather in excuse for the high charge. He then took leave, with the tacit understanding that he was not to make the subject of his midnight fare a topic of conversation.

The newly arrived, whose name was Arthur Leavesley—or Leslie, as it is now more generally written, though our hero preferred its ancient form—divested of his wet accoutrements, was a strikingly handsome man, somewhat under thirty; and though his attire aimed not even at neatness, no one who saw him could doubt that, by birth and education, he was a gentleman. Amid much bland insinuation of manners, however, might be detected a blunt eccentricity and a reckless hauteur which evinced a mind undisciplined, and perhaps a character far from stainless. With his landlady he seemed to be on very familiar terms, for he carried on with her a short but evidently important consultation. She, too, was young and good-looking, but considerably careworn, and was habited in respectable and deep mourning. In fact she was a widow, yet, from her appearance, could scarcely be mistaken for one of those who may be called 'widows indeed.' She placed some hot brandy and water before her lodger, and soon afterwards left him to betake himself to what might have been supposed needful repose. In the morning his bell rung early; he was in bed, and complained of being ill. The landlady attended assiduously to his wants, and begged he would send for medical advice. This Leavesley obstinately refused to permit, and to her other inmates she feelingly lamented the circumstance. The patient appeared to get worse, and after a fretful, restless day, he began to rave; the poor woman, kindly disposed towards him as it would seem, prepared to watch by him, and at length she thought he slept; but ere the dull morning again dawned, she perceived he was insensible. Then she sent for a doctor, who soon arrived, and was shown into the sick-room. Near the bed stood the anxious-looking widow—the only attendant. The doctor advanced and spoke, and as the woman shortly explained

the patient's state, he drew aside the heavy curtain. A single glance—a hurried touch on the cold, still brow—

'My good woman, your lodger is dead!' said he solemnly.

'Dead!' echoed the woman in a horror-stricken tone.

The gentleman put a few professional questions, the replies to which satisfied him that she had not been to blame. He then recommended her to communicate with the friends of the departed, if she knew where they were to be found, and took his leave.

The first thing the landlady did was to order a coffin; and she desired it might be made several inches longer than the body—though her lodger was a very tall man—stating that in the intervals of his short delirium he had made her promise that some papers, on which he put a particular value, should be buried with him.

It was done. He had been a stranger in the place; but the woman procured a few respectable neighbours, to whom his person was not altogether unknown, to attend the funeral. The death was immediately notified in the principal newspapers, and a few days afterwards a plain but neat head-stone was raised to mark his resting-place. His very few effects awaited the commands of his friends when they should discover what had occurred, and there were barely sufficient funds in his desk to defray the necessary expenses, however simple the arrangements had been. So another stilly sleeper was left in the strangers' cemetery, to await the last call that shall awake the dead.

But were there no mourning relations—no widowed one to weep his sudden fate, cut down in his life's prime, 'unappointed, unannealed?' We shall see. The grave-stone had hardly been raised over the stranger's turf, when another traveller reached the same busy city by the same conveyance, and by one of those coincidences not unusual in everyday life, he met with and engaged the same porter we have before mentioned to convey his small portmanteau to one of the hotels. It happened that their way lay through the street in which Leavesley had lodged, and the gentleman chanced to observe this. He then took a card from his pocket-book, and having stopped at No. 11, he said to his porter, 'Remain here a few minutes; I have an inquiry to make, and I may as well do it now in passing.' He rung, and asked for Mr Arthur Leavesley.

'Oh, dear me!' sighed the woman who appeared; 'he is dead and buried ten days ago.'

'Indeed!' was the rejoinder, but not in a tone like that of either grief or surprise. 'I wish to see what property or papers he may have left.'

'Certainly, sir. You come from his friends I suppose?'

'Friends or foes, as the case may be. I am a solicitor on behalf of his creditors.' And he handed his card.

He was shown to the room, which was yet unoccupied, and some keys were given to him. The great trunk was there. It contained heavy old ledgers and day-books, useless music and papers; and they all had an unaccountable musty smell. Nothing of the least value appeared; but the visitor placed seals on all the repositories.

As this gentleman turned from the door, he spoke some civil words to the porter in the way of apology for having detained him. Courtesy and consideration towards dependents are very rarely thrown away. The man, won by his present employer's urbanity, respectfully said, 'Did I understand, sir, you were informed of the sudden death of a gentleman who lately lodged in that house?'

'Yes, indeed I was,' replied the traveller; 'and a sad business it is.'

'Dear, dear! Could it be he, I wonder, taken off so soon, and hale and strong as he appeared? Was he a remarkably tall man, if you please, sir?'

'He was uncommonly so,' said the gentleman, now considerably interested. 'Do you happen to know anything of him?'

The man, who before had had his own suspicions, now debated with himself whether he ought to tell all he knew or not. While he yet hesitated, his employer mentioned, so far as he thought prudent, the reasons for his inquiries about Leavesley, and these settled the matter. The ulterior proceedings were singular, and resulted from the guessings of the shrewd lawyer, consequent on all he had heard. The fact was, Arthur Leavesley had, by contravention of the laws, rendered himself amenable to justice, which accordingly had stretched her iron hand to grasp him. He was an only and a spoiled child, whom early and blind indulgence had rendered first selfish, then headstrong, and finally profligate; till gaming, swindling, and forgery, wound up the dark catalogue of his vices.

A day or two after the last scene we have recorded, a small group of persons were gathered round the grave whose head-stone bore the name of Leavesley. There were present the acute lawyer, the intelligent street-porter, the medical practitioner, and the necessary officials. The earth was removed, the coffin laid bare, and opened, and a reverent pause ensued. Even to the stoutest heart there is something awe-inspiring in the presence of mouldering mortality brought to light again from the bosom of the tomb. When a silent but sufficient examination had been made by all present of the now offensive remains, each expressed his conviction.

'This is not the gentleman whose trunk I carried, first to, and then from, the Fever Hospital; his hair was jet black; this is sandy-gray,' said the porter.

'This is the corpse I saw on the bed in No. 11, C—Terrace,' said the doctor.

'This is not the person I seek,' said the lawyer. 'The body is several inches shorter than the coffin, which has been filled up with waste paper. As I suspected, this body has been procured from the hospital, ostensibly for surgical purposes, and then buried as Leavesley, in order to facilitate his escape, and for some other reasons not so evident.'

In corroboration of these opinions, another porter was found, who deposed that he had carried Leavesley's pretended luggage from his lodging to the Canal Company's Office on the same day we first met with him, so that, in fact, he had never at that time been absent from the town. A nurse and under-surgeon of the hospital identified the buried man. The landlady of No. 11 was also officially examined, without whose connivance, and indeed active co-operation, the cunning farce of the deathbed and burial could not have been attempted. She steadily refused all explanation with a calm self-possession worthy of a better cause; and as she shortly afterwards left the place, and could not be traced, the felon's pursuers were at fault for a time.

While these scenes were transacting in one part of the kingdom, a fair, young, deserted wife was pining in that sickness of the heart, so hard to bear, resulting from disappointed hope and outraged tenderness. Rosa Kearney was a lovely Irish girl. Her face and form were fresh and heart-gladdening, while the impressiveness and enthusiasm of her country glistened in her dark eye, and graced every gesture. She was Arthur Leavesley's pet cousin, and he won her warm heart even in girlhood. Little wonder, though more the pity, none of his youthful follies could detach from him her faithful affection. Neither the warning of friends nor the occasional misgivings of her own gentle spirit sufficed to save her from the gulf of misery, the depths of which, strong in woman's self-devotedness and trust, she had resolved to brave with him. If any one could guide the mistaken wanderer back to rectitude and peace, could it be other than she—his own early loved, early betrothed? So she wedded Arthur before she was nineteen, and for a while all the hopeful young wife's dreams appeared to be realised. Selfishness and prodigality, however, too soon reassumed the pilotage which the hand of love had held so lightly. Rosa, after much meek endurance of waywardness, neglect, violence, and at length desertion, was prevailed on to accept of a secluded cot-

tage, and small separate allowance, in a district of the south-west of Ireland, from her elder brother, the only one of her family who had not abandoned her to her self-chosen lot. One comfort she had to sweeten her bitter cup—an infant son, whom she nursed with even more than the usual fond care of a mother for her first-born, since in him was concentrated much of the love her husband spurned so recklessly. Another treasure she possessed in the unbought attendance of her own proverbially-attached Irish nurse. With her Rosa determined to live alone in their peaceful retreat, and she would not suffer its locality to be concealed from her erring but still loved husband; because she ever hoped for his eventual reformation, and continued to dwell on the idea that, if world-forsaken or heart-stricken, he might feel that there was one home and one bosom where he would be welcome.

How would such a being bear the tidings that now awaited her! Her brother and his wife, having been informed by the newspapers of the circumstance of her husband's death, which to them could appear only in the light of a merciful relief, hastened to the only one who would mourn for him: after a little very awkward preparatory circumlocution, the fact was communicated, as gently as possible, to the youthful wife. When the first shock was over, her pitying friends implored her to return with them to their home, which was only about fifteen miles distant; but she begged softly, yet earnestly, to be left alone, and promised to be calm, and console herself with the child. Affectionate as they were, she felt they could have no sympathy with her; and knowing the firmness, as well as the tenderness, of her character, her relatives at last consented to leave her.

After a few days, the new-made widow assumed the befitting and melancholy garb she had caused Judith to provide for her; and the first time she caught a glimpse of herself in her mirror, she turned sickening away, again to weep bitterly, as she remembered Arthur to have said, in one of the eccentric moods that had so often alarmed her, 'How well, Rosa, you would look in weeds!'

Mrs Leavesley's neat cottage and spacious garden were surrounded by a high wall with a close gate, which was locked early every afternoon. The low French windows, which opened into a veranda overgrown with roses and clematis, were also guarded at night by strong outside shutters, and the door by a powerful chain. There was no particular cause for alarm at that time from the state of the now unhappy sister island; but the place was lonely; two timid females lived there without protection, and they felt their wished-for seclusion more complete when all due precautions against disturbance had been taken. How much the greater, therefore, was their surprise and alarm when, one evening, about a week after the last blow to Rosa's hopes had befallen, as she was reading her usual evening portion of Scripture to her nurse, and the little boy slept in the adjacent room, they heard two or three low knocks at the cottage door. The hour was late, the windows were closely curtained, and no glimmer could possibly penetrate the murky darkness without to guide any wanderer to their abode. But the murmur of the reader's voice, low and soft as it was, had doubtless encouraged some one within their premises to expect admission. Yet how came any one there? For what purpose at such an hour? They listened breathlessly. Rosa, weakened by her grief, felt for a few moments almost overpowered by apprehension; she exchanged a few whispered sentences with her faithful and more courageous attendant, while the knocks were repeated a little louder, but still with evident caution.

Judith, therefore, went to the door, and asked who was there? A man's voice, in a suppressed tone, answered he came with a message for Mrs Leavesley. Unwilling to betray distrust, and yet resolved on caution, the servant, on a signal from her mistress, who stood with a light at the entrance of the chamber where

her child rested, opened the door, but kept on the chain. Judith could not see the man, for he stood in the thick gloom of the night, but he repeated an urgent request to deliver his message to the lady herself. Rosa, then, setting down her light, approached the partially-opened door, into which the cold wind rushed with a mournful howling; and it may be imagined she scarcely retained her senses when she recognised a long-loved voice whisper, 'Rosa, it is your poor, good-for-nothing husband; will you give him shelter?'

Did she hear aright?—was she in a dream?—or was it not rather a skilful imposture? Blessings on the confiding faith of woman! Rosa stopped not even to ask herself one such question. She opened the door, and Arthur indeed, disguised, and shabby, and travel-soiled, and miserable, stood under her roof, and in the holy presence of the wife he had outraged and injured. His former reckless effrontery was gone, and he seemed abashed and ashamed. Rosa's love had been long-suffering and all-enduring. At first she knew not what to expect of horror, but she saw at a glance that the threatened stroke could be no common one; and it were too much perhaps to say that most of her ill-requited affection yet survived the grave in which she had believed its object to be laid, and still she pitied, and once more she forgave. The cottage door was quickly secured, the wanderer was refreshed, and the wife was told of the danger he was in—of his belief that his pursuers had traced him, and his anxiety to reach the neighbouring seaport, whence he might have a chance to escape abroad. How breathlessly Rosa listened! how she strove to still the tumult of her ideas, and brace her energies to meet the exigency!

After all his humbling revelations, the wearied man slept on the sofa—he had not even asked to see his boy; and Rosa—

'Such hours are women's birthright'—

watched and prayed beside him. Judith had gone to bed; the light was extinguished, that the outcast might rest more undisturbedly; and amidst the deep stillness Rosa very soon fancied she heard on the gravel before the cottage stealthy steps. Arthur had leaped the high wall, and few men could perform such a feat unassisted. The wind at times whistled, and then moaned dirge-like among the leafless trees; but the anxious wife ere long became painfully convinced that the home-covert would not long avail the hunted deer. The cottage was so small—containing only two rooms and a kitchen—it afforded no hopeful place of concealment. Beneath the thatch? Ah, that was so obvious! Disguise was equally hopeless—his stature so rare, and so conspicuous. There was a great old-fashioned clock that stood in a dark niche just outside the parlour door; might it not be moved a small space, and a hiding-place found behind it? It might be tried; at all events it was the sole, slight chance. Amidst these sickening thoughts and plannings a few torturing hours passed, and the wintry sun of December was hardly visible, when knocks for admittance were again heard. The old woman looked as cross as possible on the early guests; but of course was quite respectful when informed by one of three men whom she saw that they sought a felon, who was supposed to be there concealed from justice. Judith assured them, with an unconcerned tone admirably adapted for the occasion, that 'they were heartily welcome to search the little dwelling—it would be no tedious or difficult task—but she wished them to wait her mistress's time of rising, who was in deep trouble, poor young *craythur*, for the loss of a good husband!' With a broad sneer at this last figure of speech, the men consented to wait a little; and ere their patience had been too much tried, they were shown into the room where Rosa's solitary breakfast was delicately laid out, and herself giving her little boy his morning meal. Her wan, lily-like loveliness, her newly-donned widow's dress, her graceful calmness and dignity, evidently awed the rough visitors. One of them espe-

cially, who appeared the superior, gazed on the girlish-looking figure before him with deep commiseration. He chanced to have a young sister in declining health, and he thought she resembled Rosa; with that thought came memories of home and its sanctities, which for the moment chased present harsh duty from his mind; and ere leaving Rosa's presence, after a cursory look over the apartments, this person said in a respectful manner, 'Madam, we regret to be obliged to do our duty so strictly, but a considerable reward is offered for him we seek.' Then lowering his voice till it became a murmur, inaudible to all but her he addressed, he continued, 'A watch will remain outside for a time; when the way is clear, you will receive by post a blank envelop.' He glanced significantly towards the clock; and while the blood rushed to poor Rosa's brow, she could only command a look and gesture of unutterable gratitude as he departed to superintend a fruitless search in the garden and outhouses.

What an ordeal had this scene proved to the faithful wife! In extenuation, however, of the officer's apparent dereliction of duty, we may here explain that the principal sufferer by Leavesley's guilt, having once felt himself under no small obligation to the criminal's mother, had given a confidential hint that he would not be much disappointed if the fugitive escaped.

For several succeeding days Rosa concealed her undeserving husband under her roof. The paucity of her visiting acquaintances made the task more easy, yet the conflict of feeling during the anxious interval strewn her dark tresses with many a gray hair. It was not fear of detection, or any personal terrors, that were the bitterest ingredients of the cup prepared for her, but the too obvious truth forced on her mind, that the being with whose lot her own had been so fatally linked was still the same mean, selfish, and exacting character he had ever been. Had she witnessed, or could she have awakened, one repentant sigh or word, her sorrows had been mitigated, and she would have readily even shared his exile; but this was far from his thoughts: he even dared to look with cold-blooded complacency on Rosa's widow's habit and grief-worn frame.

On one of the days of Leavesley's concealment, Rosa walked abroad with her little boy. The sun's beams were cheering, though the air was wintry, and the infant Eugene was just trying his first tottering steps alone. At the top of the lane that led to her dwelling she saw the surly minion of justice deputed to watch over her premises, and would have passed on, as if unconscious who he was; but he hung a little on one side, and looked on her with an eye so penetrating, that she at once repented having left the house, and felt her best plan was to speak.

'Good-morning, friend!' she said as cheerfully as she could, though, in spite of every effort, her voice trembled. 'I hope your employers will soon relieve you from a very bootless, and, it must be, a very ungracious task. Would you not step to the cottage and get some refreshment?'

The man, totally subdued by her sweetness and kindness, thanked her respectfully, and patted and praised her beautiful child. Involuntarily she would have withdrawn him from the touch, but restraining herself, she continued her short stroll, and soon returned to find all things as she had left them.

One obvious anxiety weighed heavily on Rosa's mind: Leavesley trusted to her to raise a small sum of money to assist his escape, without which, indeed, all present precautions were fruitless. But Rosa had nothing she could call her own. Everything of any value she possessed had been before relinquished to supply one who scrupled at no means to provide for his own worthless indulgences. The little plate in her present abode had been provided by her for her use, and no sophistry could prevail on her to appropriate it as hers. The only plan within her reach, however, she had resolved to try, and only waited the opportunity—it was successful, because the plea was meek and self-denying,

and the friend she appealed to was generous and unsuspicious; and thus it was:—Rosa's warm-hearted sister-in-law came to visit her, as was usual with her. This had been foreseen, and the fugitive was hidden in a closet, of which his wife kept the key. Mrs Kearney repeated her own and her husband's anxious desire that her gentle, heart-broken sister, should give up housekeeping, and, with her nurse and boy, occupy apartments in their large family dwelling. Rosa promised that she would at all events pay them a long visit after a fortnight or so. It required some vigilance to guard the conversation from wandering to the past; and little did her sister-in-law suspect that the complaining wife was privy to the sad and disgraceful reports that had lately reached them, far less could she have any idea of the actual truth.

After an hour's interview, Rosa summoned courage to make her request.

'Ellen, dear,' she falteringly began, 'I can hardly bear to ask it, but some embarrassments I cannot avoid press on me just now—could you lend me fifteen or twenty pounds? I hope to repay you soon. When our uncle's little legacy becomes due, I shall have the means, you know'—

'Why make apology for so easy a matter as that?' interrupted Mrs Kearney with affectionate frankness. 'You must have had additional expenses in your mourning. I will send it to you to-morrow.'

'Oh, thanks from the bottom of my poor heart!' sighed the relieved Rosa, while there was an unseen listener cursing her stupidity and obstinacy that she had not asked double the amount.

It may be believed that the wife, faithful, unflinching as she was, expected anxiously the promised signal. One morning the ground was covered with snow, and a letter lay on the breakfast-table, addressed in an unknown, but evidently disguised hand; with trepidation, she found it was 'a blank envelop.'

The succeeding night came on dark and thick, but the escape must be attempted. The faithful Judith guided the fugitive by a back way out of the village. Providence was pleased to give the wretched wanderer one more chance. A heavy fall of snow obliterated all trace of departing steps, and otherwise screened his progress; and on the third day a country lad put into Mrs Leavesley's hands a bit of soiled paper, on which were scrawled these words, 'On board the *Donna Juana* for Valparaiso—blessings on my angel wife!'

Thus was the tie between Arthur and Rosa severed for ever; but that scrap of paper was buried with her. Were this little story a fiction, it would not be concluded without recounting Leavesley's reformation, and his wife's reward in his future devotedness; but in real life, we believe a course of profligacy like his rarely ends thus favourably. Let the youthful, the innocent, and confiding beware how they peril their happiness on the forlorn-hope of reclaiming one who commences life by learning only to live for himself.

Having finally accepted of a home with her brother, it was some months ere Rosa could make any inquiries about the vessel Leavesley had embarked in. It never reached its destination! and the weeds Rosa had continued to wear, though only a widow in heart, were now indeed felt to be but due mourning for the dead. Her friends never knew aught of the fate of one whose memory they strove—and, as far as they were concerned, successfully strove—to bury in oblivion.

A little farther explanation will perhaps be acceptable. On the marriage of the young pair, a moderate but suitable jointure had been secured to Rosa over an entailed family property of the husband's. In the midst of his disgraceful necessities, it became an object of Arthur to procure the resignation of this deed from his too tender and facile wife. Her brother's care alone prevented the accomplishment of this purpose. Hence some of the violent scenes towards the unoffending wife: hence also the plan of the pretended death; for the elder Leavesley, who still lived, but had disowned and

discarded his son, would then be obliged to pay half the rent-charge to the widow; the rest would only accrue to her at the old gentleman's decease. Arthur then felt sure he should frighten or cajole Rosa into his measures, and receive from her supplies she could only have at her disposal subsequent to his death. This was the object—and no lingering tenderness of a better nature—of his last visit, and, alas! it is to be feared, the object even of his last note, tenderly as it was cherished.

After a time, Rosa regained—what the virtuous and self-denying seldom lose, except temporarily—her peace of mind. Her son was carefully brought up, and became everything she could desire. Cognisant of the painful cloud that had darkened his father's character and fate, he resigned the patrimony that had become his to discharge all the unlawfully-incurred obligations; and afterwards, in another hemisphere, strove, by a strenuous course of industry and good conduct, to earn for himself a name which his children might inherit without the blush that had so often crimsoned his own cheek. His mother now left him; and it was not till she had seen a young group of her Eugene's offspring rising around her that he at last closed her eyes. But even up to that solemn moment did thoughts of the wife's duty she had performed to her once-loved but unworthy husband recur, 'like the memories of joys that are past, pleasant though mournful to the soul.'

SOCIETY AMONG THE LEVANTINES.

THROUGHOUT Syria and Lower Egypt there is a particular division of the population known under the name of Levantines, which signifies those Christians of Eastern origin who live scattered in small groups among the Moslems. In manners, customs, and appearance, these people are scarcely distinguishable from their neighbours, and, with the exception of the leading tenets of their creed, there would seem to be very little in their minds or morals which they do not possess in common with the followers of Islam. Yet upon a near approach you discover many differences. Externally under the influence of the general public opinion of the country by which in many things they are compelled to conform with what their masters ordain, they cherish among themselves a subordinate public opinion which, though powerless so far as the Osmanlis and Arabs are concerned, acts with irresistible force within the narrow circle of its operation.

Of this small section of the population of Western Asia comparatively little is known in Europe. Travellers habitually disdain to associate with oppressed and ignoble races, whose peculiarities are supposed to offer little that would repay research. But this is founded in error. Taking our stand upon the peaks of Lebanon, and looking around us towards the east and towards the west, towards the north and towards the south, our eye can scarcely alight upon any community, however small, whose institutions and manners are not more deserving of study than those of the common masters of the country. Whatever the Turks were formerly, they have now almost ceased to be an interesting people. The same remark cannot of course be applied to the Arabs; but most of the extraordinary sects found in Syria or Egypt are of Arab origin; and precisely the same mental qualities which have invested Islamism in several countries of Western Asia with so many charms, have diffused an atmosphere of poetical superstition over the intellectual world of the Levantines, and of all those other sects, whether Christian or Mohammedan, which still lurk in obscurity among the Syrian mountains, or develop their strange ideas in the great cities of Egypt.

Most historians or travellers who have written on Asiatic Turkey have glanced more or less obscurely at the communities to which we allude: the Kadmoossims, the followers of Hakim Beamrillah, the Yezides, the

Ismailieh, the Ausarians, the Druzes, and other nests of heretics or pagans found in those regions. But who has yet penetrated into their inner life? Who has lived familiarly among them, and delineated with anything like authority their manners, opinions, and secret institutions? Nearly all that is popularly believed of them rests on rumours, in the highest degree vague and uncertain, though probably sufficient materials even now exist for unveiling the characters, manners, and mental idiosyncrasies of all these wild races.

Mr Bayle St John has proved, by a volume just published,* that some at least of these obscure communities are accessible to European curiosity. Arriving at Alexandria in the summer of 1846, and perceiving that there was nothing to be gained by associating with the Franks, he determined to acquire a knowledge of the Arabic, and to live almost exclusively among the natives. Perseverance might probably have opened to him the interior of a Moslem family, for, though prejudiced and bigotted, the Arabs are still a sociable people; but circumstances directed him towards the Levantines. Becoming acquainted with a Syrian family whose fanaticism had been in some degree mitigated by intermarriage with an Italian, he was admitted, as it were, behind the veil, and for two years lived habitually in an Eastern harem.

Possessing great powers of observation, and the talents necessary to record his impressions, he immediately set himself about keeping a journal, in which he chronicled his remarks, the stories and anecdotes he heard, and the accounts which one family or individual gave him of another. In this way his materials rapidly accumulated; for when on terms of familiarity, no people in the world are more communicative than the Orientals, who may literally be said to have no secrets from those whom they like. Mr St John, with singular felicity, takes us along with him in his experience, makes us thoroughly acquainted with Sitt Madoula, the widowed mistress of the family, with her son Iskender, her beautiful niece Wardeh, her relative Om Barbara, her intimate acquaintance Sitt Sopho, and even her slaves, Zara, Hannah, and so on. As might have been expected, the introduction of a Frank into the interior of a Levantine family could not be accomplished without much scandal. The priests were alarmed lest some rays of knowledge from the West should melt away the foundations of their empire; strange suspicions were excited in the minds of relatives lest the Sitt should conceive the dreadful design of uniting the beautiful Wardeh with the heretic from Frankistan. Other terrors, more shadowy and indefinite, shook the whole body of Levantine society in Alexandria, and a prodigious system of diplomacy was set on foot to defeat the Machiavelian policy of Sitt Madoula; but, in her way, this lady was quite a philosopher, having emancipated herself, partly perhaps by the aid of her deceased husband, from the tyranny of ecclesiastical influence, and acquired the rare courage to think, on some points at least, for herself. Besides, her son Iskender had conceived a friendship for the young Frank, and the Sitt being, above all things, an affectionate mother, set the inclinations of her son considerably before the wishes of the priests, and determined to act on her own independent convictions.

The history of these transactions, negotiations, and intrigues, is given with much naïveté and humour by Mr St John, but is unsusceptible of abridgment, because all the point consists in exhibiting at length the immense waste of ingenuity employed to accomplish nothing at all. By degrees, every obstacle having been removed, the traveller finds himself in his new residence, of which he took possession on the eve of the Ramadhan. As this belongs exclusively to Mohammedan life, we shall here enter into no description of it, though we happen to have witnessed it ourselves in the

* *Two Years' Residence in a Levantine Family.* By Bayle St John. Chapman and Hall. 1850.

most interesting portion of the Nilobe Valley. On the occasion of adding a new member to the family, the Levantines of course could not avoid some small extra display of hospitality. It conveyed, however, no false ideas of their manner of living, for we may observe at once, that up to the latest day of his residence, Mr St John found Sitt Madoula and her family kind, affectionate, and disinterested, infinitely more desirous to render his residence agreeable than to convert it into a source of profit for themselves. Be this remembered to their credit especially, as all their goodness may be said to be spontaneous, since it is based on no artificial system of instruction, and derived from nothing external to themselves.

Being desirous of observing all the great features of Eastern life, Mr St John, on hearing the announcement of the commencement of Ramadhan, was desirous of going forth and mingling with the Moslem crowds; but to this Sitt Madoula objected, observing that his first supper as one of the family was preparing, and that he must not leave the house! 'Halil Adin, who, from having been a servant in the house, had become a small shopkeeper in one of the bazaars—*alias*, in the language of the country, a merchant—came into supper, and we three—I, he, and Iskender—sat down at a little round table crowded with messes. Soup in a pie-dish in one corner; a bowl of *melookekeh* (a glutinous kind of herb) in the middle; a plate of radishes supported on the edges of these two; a plate of *thababs*, or small pieces of mutton broiled on skewers here; a dish of rice there; flat cakes of bread thrust into every vacant place, with numerous limes, which are squeezed over every mess; three clean plates, one knife, four forks, two spoons; glasses placed on chairs by our sides, with some extra dishes; Sitt Madoula, stumping about on her stilt-like clogs to see that everything was right; Wardeh standing in the doorway with a water-cooler resting in the palm of her hand, ready to give us drink, and casting the beams of her bright eyes upon us; Ali lazily squatting down in the gallery outside; Hannah, the maid, endeavouring to be generally useful. Such were the elements of the scene as I remember it. I must not forget that Halil was famous as an enormous eater, and that the great joke at table was to count and exaggerate the number of bread-cakes he devoured. A few words of grace were rapidly uttered before and after the meal, during which water was the only drink. The Levantines eat very fast, start up as soon as they have done, and have water poured over their hands, which they also sometimes rub with lemon-juice, and then smoke.

To give some idea of the other inmates of the house, we turn back a little, and extract a passage from Mr St John's description of his first visit to the Sitt:—'In the first place, Sitt Madoula was a comely dame of thirty-seven, with dark eyes and jet-black hair, somewhat carelessly arranged in front, and surmounted by a small tarboosh or red cap. Behind fell a profusion of small tresses, mixed with an immense number of oval-shaped gold spangles, hung upon plaits of braid. A kind of pelisse split down the sides, with long tails tucked up into her shawl in a not ungraceful manner, and large loose trousers, formed the principal articles of her costume. We could see also a coarse gauze chemise, beneath which her bosom, raised up, and pressed together, appeared in great prominence. The ancient beauties of Egypt do not show so much shoulder as their counterparts in Europe, but they are still far too liberal in their exhibitions. Sitt Madoula, who was hovering between the two seasons, was more moderate in her costume than most others I have seen.'

Of the other members of the household we have the following sketch:—'A lachrymose-looking old lady, whose short legs, encased in white stockings—Sitt Madoula was barefoot—could be seen up to her knees as she sat for comfort on the floor, was always mentioned as Om Barbara—the mother of Barbara—which said Barbara was a laughing, saucy-looking, and little Levantine beauty, with her hair decked out with pearls, in

addition to the customary stream of braid and gold spangles behind. A tight rose-coloured satin vest showed off her fine shape; and being open in front, gave one ample opportunity, despite the feigned protection of a thin gauze chemise, of ascertaining the delicacy of her skin. She sat on the divan, in the midst of a perfect cloud of strawberry-patterned muslin trousers, from beneath which her small pretty feet, encased in yellow morocco slippers, just peeped forth. We had taken this family party quite by surprise, or else this dangerous little person would have been packed off into another room. She had been urged to go by her husband and others, whilst we were fumbling in the dark passages below and the staircase; but curiosity and wilfulness had induced her to hold out until it was too late. A young girl, who peeped in once or twice, had been taken by the shoulders and turned out on the very first announcement that the Franks were coming. I had afterwards ample opportunities of observing the half-and-half manner in which the Christian natives of the East imitate the harem regulations of the Moslems. An Englishman, as a Frank, and, above all, as a heretic, is more especially tabooed. Among their own race comparatively little restriction exists, most women showing themselves to whomever the husband invites to the house. In public, however, they always appear veiled, though less closely than the Moslems; and in church they invariably sit in a gallery shut in with lattice-work, too close for the curious eye to penetrate!'

No one can have lived for how short a time soever in the East without having observed the beauties of the cities by night, which invariably suggest to the imagination the idea of an unreal world beheld in a dream. At times, in Alexandria, the atmosphere puts on a European character, with pale fleecy clouds and an obscure moonlight. But farther south, especially within the tropics, there is a glowing richness in the night-scenes not easily conceivable or credible in the north. We remember to have come once by night upon a city of ruins, where bath and palace, mosque and minaret, cottage and caravansera, were mouldering beneath the slow touch of time. Heaps of hewn stones were piled up in various places, where war or earthquake had hurled some grand fabric to the dust, while here and there feathery mimosas and tremulous willows waved over the ruins in the delicious night breeze. Below, at a short distance, rolled the broad Nile, while the bright moon silvering the whole, and rendering it half-transparent, gave all we saw the appearance of a picture rather than of a reality.

In summer nights especially, when the wind blows from the desert, Alexandria itself is overhung by a sky of tropical purity. It is then delightful to walk abroad, to visit the deserted cemeteries, and climb the mounds, or stroll along the sea-beach. This, however, is a pleasure almost unknown to the Levantines, who, addicted to the early opening of shops, retire to bed shortly after nightfall, that they may be up in the morning with the lark. But Mr St John, by no means a Levantine on this point, describes his night rambles in Alexandria in a very picturesque manner. 'Usually,' he says, 'in my night rambles I found all silent and lonely. As soon as darkness begins to set in, the streets become rapidly deserted; women especially disappearing as if by magic. Some movement of the population continues for about an hour and a-half more; but after the gun fires, it is rare to meet a person even in the best inhabited streets; their aspect then became to me peculiarly picturesque. The forms of the houses are infinitely varied, and it is uncommon to see a single line that is horizontal or perpendicular; the terraced roofs are broken up with kiosks and sheds; the fronts are crowded with projecting windows, that seem to weigh the buildings on either side forward so as almost to make them touch. In some cases a pair of lovers might kiss from balcony to balcony; at others there is a little angular open place before a small mosque, with the scalloped parapet of its terrace and its light minaret faintly defined against

the sky—that is to say, even on starlight nights, when most of the streets seemed mere black defiles. When the moon shone, it was perfectly marvellous to see the distinctness with which every object manifested itself, even to the delicate tracery of the loftiest pinnacle; and how the reflection of the white walls aloft threw down a pale light into the gloomiest passages. In the ruined streets I often stopped to watch the moonbeams working their way in silver streams through broken walls and unlatticed windows, and giving a thousand fantastic shapes to uniform heaps of stones and wood-work.*

Of the population which circulates through these streets by day, few in common conversation speak of the picturesque. Their lives are spent in money-making; but when they come to erect a mosque, or build a house, or lay out a garden, their innate sense of the beautiful leads them to make a profuse display of what we call taste. Meanwhile, nothing can be more disjointed than their minds. They have no correct ideas of anything: no logic, no metaphysics; no power whatever of distinguishing between the possible and the impossible. What they excel in is faith. They can believe anything; and it may be observed that even Europeans who live much among them irresistibly acquire something of their credulous habit of mind.

Here, in Western Europe, we affect at least to entertain a profound reverence for truth. But in the East lying has been by many writers declared to be a virtue, because it is often the only shield which the weak have to interpose between themselves and ruin. The rulers of the earth endeavour to appropriate to themselves the whole gains of the industrious. The latter, as a matter of course, seek to outwit them, and a vast system of mental and moral tactics is called into play on both sides. Power has obviously less need of disguise and concealment than weakness, and therefore the Turks have obtained a better character for speaking the truth than the races subject to their sway. But their proceedings forcibly remind one of the witty sophism of Butler—

'He that imposes an oath makes it,
Not he who for convenience takes it.
So how can any man be said
To break an oath he never made?'

If, however, like other people, the Orientals had an original bias towards truth, bad government has long ago cured them of it. They have now come to attach a sort of mysterious dignity to lying, especially the Levantines, who, oppressed, insulted, and plundered by the Turks, take refuge in the petty arts of untruth and iniquity for self-defence. Mr St John observes that 'the natives of Egypt believe that there is great virtue in a lie; so that if dyers, for example, find that their dye in the vats take in an inferior manner, they think it incumbent on them to spread some report the most unfounded and absurd possible. If it obtain credit, the evil they complain of is at once remedied. I find in my journal the following specimen:—About ten days past the report came in that the inhabitants of a certain village were turned into black stones. All the Mohammedans, and most of the Levantines, believed in it; and it was currently stated that Said Pasha had set off at once to examine into the matter. Yusuf Id, however, who is a sagacious man, remarked that a courier just arrived from the neighbourhood knew nothing of these facts, which was a presumption that they were incorrect. The hoax was soon afterwards traced to the dyers.

'It is not, however, one class of people only who believe in the magical efficacy of lying. If a man has two wives, one of them will somehow, in connection with a sorcerer, write a magic incantation to monopolise all his love, and cause the other to be neglected. The forlorn one has no other means to destroy the charm than to tell some horrible lie, and get it to be believed either by her husband or the public. In case of success, she is instantly reinstated in her rights. The Christians

have the same abominable superstition, and one morning I remember that Iskender came and swore most solemnly that he was going to Rosetta to collect some debts. The object was to remove a spell which had prevented him from effecting any important sale for three days—as I believed him, at least for a moment. It seems he was fortunate, and made a profit of ten dollars before I gave him a visit in the afternoon.'

Mr St John's volume is full of stories and anecdotes, some of which illustrate the character of the Moslems as well as those of the Eastern Christians. In general, the former are the interesting and poetical people, being under the influence of more stirring beliefs and wilder and more original superstitions. In moral principles also they are perhaps superior, because they obey more strictly the injunctions of their faith. Still, the difference is not very great, as Mr Bayle St John, after carefully summing up the whole affair, admits.

From our observations and the passages we have selected, it will be obvious that Mr St John's volume is full of interest, and contains a striking picture of an extremely peculiar phase of Eastern society. Some of the stories introduced are scarcely inferior to those in 'The Arabian Nights.' The style is easy and elegant, simple for the most part, but occasionally glowing with imagery. Few populations of the East have had so much justice done them as the Levantines in this volume, which is superior in interest and value to the same writer's visit to the Oasis of Jupiter Ammon.

SYDNEY SMITH'S MORAL PHILOSOPHY.*

The Royal Institution is an establishment situated in Albemarle Street, London, and is well known as containing professors of several of the sciences, who deliver lectures and carry on researches within its walls. It is a subscription institution, and is supported by the nobility and gentry of the metropolis. The fame of Davy, Young, Faraday, and other illustrious professors, has made its name familiar wherever physical science is known.

In the years 1804, 1805, and 1806, the Rev. Sydney Smith delivered short courses of lectures on the human mind, choosing a different subject in each successive year; and the whole of the three courses are now reprinted from the notes, and given to the world as an additional contribution by their celebrated author to the instruction and amusement of the reading public. As no other work of his makes any approach to a systematic exposition of the laws and workings of the human mind, these lectures have the aspect of an entirely fresh composition. The public were by no means prepared to find Sydney Smith becoming a rival to Reid and Stewart, or to hear his name classed among the writers necessary to be known to the student of metaphysical science. Yet such is the fact; and it may be fairly asserted, that so long as the writings of Adam Smith, Reid, Campbell, Stewart, Brown, or Alison, continue to be authorities in this department of science, it will be worth while to read along with them the expositions furnished by this renowned laughing philosopher.

The courses comprise the subjects of the Understanding, Taste, and the Active Powers, following the divisions adopted by Reid and Stewart. The subdivisions of the two first are very much in accordance with those writers; but in the last branch, the active powers, the author boldly takes wing in an independent flight of his own, being dissatisfied with Reid's excessive multi-

* Elementary Sketches of Moral Philosophy, Delivered at the Royal Institution in the Years 1804, 1805, and 1806. By the late Rev. Sydney Smith, M.A. London: Printed for Longman, Brown, Green, and Longmans, Paternoster Row. 1850.

plication of the separate powers and faculties of the mind. All through, he attempts the reduction of the phenomena to as few first principles as possible; but it is only in the treatment of the Active Powers that he may be said fairly to overdo the thing, and to contribute fresh confusion, instead of new light, to a difficult subject. He sees nothing in any of the passions, affections, desires, loves, and hatreds of humanity, but the consequences of one or other of the two facts recognised under the names of the love of pleasure and the dread of pain.

The merits and recommendations of a metaphysical book, as of any other scientific book, may be very various. There may be a positive advance made towards clearing out and ascertaining the first principles and fundamental ideas lying at the root of the well-known but ill-understood phenomena of the mind; in other words, the work may be eminently philosophical by being successful in its simplification and analysis of the facts of the subject. Or the recognised facts and appearances may be brought together, classified, defined, and illustrated, by interesting examples, without any attempt being made to reduce them to their component first principles, or most simple elementary facts; the operations of memory, reason, imagination, taste, beauty, affection, conscience, may be all detailed and bodied forth in instances, and the writer refrain all the time from endeavouring to reduce these several compounds into their primitive constituents; he may do his utmost to improve our acquaintance with these powers as they appear to the ordinary human eye, without feeling himself able to seize the Creator's point of view, which would represent the ultimate strings that set the whole in motion. Moreover, without much of clearness in the delineation of the various faculties even thus grossly taken, a writer may make an interesting book by stringing together a number of striking facts, incidents, and pictures of human nature and human life; or by bringing out into relief some vein of feeling or sentiment, as is done in histories, poetry, and romance, and call his book a work on the human mind. A powerful and richly-cultivated mind arrests our attention in almost any way that it chooses to exercise itself; even if it should fail in its professed aim, it succeeds in something else; and it is not every reader that complains of a work pretending to be scientific that it is in fact poetical or romantic.

If, then, a work on the mind may be an analysis, a delineation, or a string of interesting pictures, allusions, and discussions, the reader may ask which does the present fall under? The reply, according to the best of our judgment, and as well as a few words can describe a complex thing, is, that it is a tolerable analysis, a splendid delineation, and a rich mine of amusing and inspiring pictures and incidents of the kind already well known to the world through the other writings of the author.

If we consider that nearly half a century of active thinking has elapsed since these lectures were written; that the author, although a man of very high ability and intelligence, was not pre-eminent in analytical faculty; that he had not studied the subject for any great length of time, or with much undivided attention—we shall not expect his work to be of much value at the present day as an accurate analysis or strict scientific resolution of the complicated problems of human nature. Any one taking it in this light would only become more ignorant, by being made more mistaken, by its perusal. The exposition of the senses is worth nothing in a scientific point of view, and the analysis of the active powers is worth less than nothing, and does not even deserve the compliment of a refutation.

But of such merits as the book has, which are neither

few nor small, we shall now present a few specimens to the reader, who will no doubt expect to be treated, in preference to all other things, to some fresh examples of the irresistible comic creations that have so often set the world in a roar.

The first three lectures are occupied with the history of moral philosophy; and although, as a history of philosophy, nothing could well be less deserving of attention, yet, as a string of rich and racy pictures and illustrations, few histories can compare with it. Here, as everywhere, he brings the subject thoroughly within the comprehension of the most ordinary reader; and if it is intrinsically dry or dull, he adds an interest to it from his inexhaustible fountains of wit and richness of composition. Take the following remarks on Socrates as an example:—'The slight sketch I have given of his moral doctrines contains nothing very new or very brilliant, but comprehends those moral doctrines which every person of education has been accustomed to hear from his childhood; but two thousand years ago they were great discoveries—two thousand years since common sense was not invented. If Orpheus, or Linus, or any of those melodious moralists, sung, in bad verses, such advice as a grandmamma would now give to a child of six years old, he was thought to be inspired by the gods, and statues and altars were erected to his memory. In Hesiod there is a very grave exhortation to mankind to wash their faces; and I have discovered a very strong analogy between the precepts of Pythagoras and Mrs Trimmer—both think that a son ought to obey his father, and both are clear that a good man is better than a bad one. Therefore, to measure aright this extraordinary man, we must remember the period at which he lived; that he was the first who called the attention of mankind from the pernicious subtleties which engaged and perplexed their wandering understandings to the practical rules of life—he was the great father and inventor of common sense, as Ceres was of the plough, and Bacchus of intoxication.'

Equally amusing is his account of the chequered reputation of Aristotle:—'Whoever is fond of the biographical art, as a repository of the actions and the fortunes of great men, may enjoy an agreeable specimen of its certainty in the life of Aristotle. Some writers say he was a Jew; others that he got all his information from a Jew—that he kept an apothecary's shop, and was an atheist; others say, on the contrary, that he did not keep an apothecary's shop, and that he was a Trinitarian. Some say he respected the religion of his country; others that he offered sacrifices to his wife, and made hymns in favour of his father-in-law. Some are of opinion he was poisoned by the priests; others are clear that he died of vexation, because he could not discover the causes of the ebb and flow in the Euripus. We now care or know so little about Aristotle, that Mr Fielding, in one of his novels, says—"Aristotle is not such a fool as many people believe, who never read a syllable of his works."

The following passage expresses with great force the growth of our intellectual capabilities by exercise and habit:—'What a prodigious command, for instance, over all those associations which are productive of wit, must the head wit of such a city as this or Paris have acquired in twenty years of facetiousness—having been accustomed, for that space of time, to view all the characters and events which have fallen under his notice with a reference to these relations! What an enormous power of versification must Pope have gained after his translations of the "Iliad" and the "Odyssey!" so that no combination of words or inflection of sounds could possibly have been new to him; and he must have almost meditated in hexameters, and conversed in rhyme. What a powerful human being must that man become who, beginning with original talents, has been accustomed, for half his life, to the eloquence of the bar or the senate! No combination of circumstances can come before him for which he is unprepared: he is always ready for every purpose of defence and attack; and

trusts, with the most implicit confidence, to that host of words and images which he knows, from long experience, will rise up at any moment of exigence for his ornament and support.

His first course, comprising the Intellect, comprehends two vigorous lectures on the conduct of the understanding, full of good sense and powerful exhortation, and concluding with a panegyric upon the love of knowledge, which sounds fresh and animating, in spite of the millions of addresses on the subject delivered during the succeeding six-and-forty years. And we can remark through the whole of this work an intense sentiment in favour of the pursuit of knowledge, which must be set down as a leading characteristic of the mind of the author, although only one of the ordinary consequences of a superior intellect.

The second course, which comprehends Wit and Humour, Taste, the Beautiful and the Sublime, is full of the most interesting and enlivening delineations, and is in many parts of its analysis successful and happy.

That Sydney Smith should be entertaining on wit and humour, we expect as a matter of course. Other expounders must cull and select their instances of these qualities: he can both cull and create. Incongruity, according to him, is the chief ingredient in the ludicrous; and he is no doubt correct so far as the term incongruity is itself definite; but as all sorts of incongruity are not witty or humorous, some special limitation or qualification must be put upon the term. Here is one of his examples:—'As you increase the incongruity, you increase the humour; as you diminish it, you diminish the humour. If a tradesman of a corpulent and respectable appearance, with habiliments somewhat ostentatious, were to slide down gently into the mud, and dedecorate a pea-green coat, I am afraid we should all have the barbarity to laugh. If his hat and wig, like treacherous servants, were to desert their falling master, it certainly would not diminish our propensity to laugh; but if he were to fall into a violent passion, and abuse everybody about him, nobody could possibly resist the incongruity of a pea-green tradesman, very respectable, sitting in the mud, and threatening all the passers-by with the effects of his wrath. Here every incident heightens the humour of the scene—the gaiety of his tunic, the general respectability of his appearance, the rills of muddy water which trickle down his cheeks, and the harmless violence of his rage!'

Under taste he requires to discuss the influence of association in making things agreeable that are not so intrinsically. But association cannot explain all cases of agreeable emotion. 'That there are some tastes originally agreeable I think can hardly be denied; and that Nature has originally, and independently of all associations, made some sounds more agreeable than others, seems to me, I confess, equally clear. I can never believe that any man could sit in a pensive mood listening to the sharpening of a saw, and think it as naturally agreeable and as plaintive as the song of a linnet; and I should very much suspect that philosophy which teaches that the odour of superannuated Cheshire cheese is, by the constitution of nature, and antecedent to all connection of other ideas, as agreeable as that smell with which the flowers of the field thank Heaven for the gentle rains, or as the fragrance of the spring when we inhale from afar "the milk-white thorn that scents the evening gale."'

In discussing the beautiful, where he is, as usual, the opposite of everything that is dry or abstruse, he considers the effects of the various ingredients that enter into beauty; but he cannot agree with Burke as to the admissibility of *smallness* as an ingredient. 'If smallness were one cause of beauty, we should have remarked it in the great mass of amatory poetry, which has been accumulating since the beginning of the world: the lover would have told his mistress, from time immemorial, that she was so short, that she could walk under his arm; that she weighed less by twenty or thirty pounds than any other beauty in the neighbourhood;

that he solemnly believed her only to be five feet; and he would have diminished her down by elegant adulation to think as lowly of herself as possible.'

The effects of utility and adaptation to ends in exciting the emotion of beauty he exemplifies by the following case:—'Go to the Duke of Bedford's piggery at Woburn, and you will see a breed of pigs with legs so short, that their stomachs trail upon the ground; a breed of animals entombed in their own fat, overwhelmed with prosperity, success, and farina. No animal could possibly be so disgusting if it were not useful; but a breeder, who has accurately attended to the small quantity of food it requires to swell this pig out to such extraordinary dimensions—the astonishing genius it displays for obesity—and the laudable propensity of the flesh to desert the cheap regions of the body, and to agglomerate on those parts which are worth ninepence a pound—such an observer of its utility does not scruple to call these otherwise hideous quadrupeds a beautiful race of pigs.'

The feeling of the sublime has been much more successfully analysed than the far more complex feeling of beauty; and on it our author is to a great degree scientifically correct, as well as pictorially brilliant. His illustrations of the sublime, both natural and moral, are well chosen and grand. One of them is worth quoting:—'Everybody possessed of power is an object either of awe or sublimity, from a justice of peace up to the Emperor Aurengzebe—an object quite as stupendous as the Alps. He had thirty-five millions of revenue, in a country where the products of the earth are at least six times as cheap as in England; his empire extended over twenty-five degrees of latitude, and as many of longitude: he had put to death above twenty millions of people. I should like to know the man who could have looked at Aurengzebe without feeling him to the end of his limbs, and in every hair of his head! Such emperors are more sublime than cataracts. I think any man would have shivered more at the sight of Aurengzebe than at the sight of the two rivers which meet at the Blue Mountains in America, and, bursting through the whole breadth of the rocks, roll their victorious and united waters to the Eastern Sea.'

Two lectures devoted to the faculties of beasts are highly creditable to the author's sagacity and boldness. At a time when it was usual to attribute instincts exclusively to the lower creation, he came forward and maintained the existence in them of the same kind of intellectual operations as we find in man, and produced the most indubitable examples of brute memory and reasoning. He also exposes, in a vigorous strain of mixed eloquence and humour, the childishness of our entertaining any jealousy of the brutes, or any fear that the distinction between us and them will be obliterated by such an admission. Without derogating from the superiority that man derives from his mental endowments, he illustrates, in the most entertaining fashion, the advantages we gain by our other peculiarities, such as length of life, gregarious nature, stature, and the capabilities of the human hand. 'If we lived seven hundred years instead of seventy, we should write better epic poems, build better houses, and invent more complicated mechanism, than we do now. I should question very much if Mr Milne could build a bridge so well as a gentleman who had engaged in that occupation for seven centuries; and if I had had only two hundred years' experience in lecturing on moral philosophy, I am well convinced I should do it a little better than I now do. . . . A lion lies under a hole in a rock, and if any other lion happen to pass by, they fight. Now whoever gets a habit of lying under a hole in a rock, and fighting with every gentleman who passes near him, cannot possibly make any progress.'

In commencing his third course, on the Active Powers, he reverts again to the great practical subject of the conduct of the understanding, and discusses the ways and means of intellectual improvement. Dissertations of far less merit for sound sense, discrimination,

and powerful manly expression, have passed for wisdom on this subject; but we cannot afford more than a single quotation, containing an advice to any young men that may have fallen into the bad habit of contradicting:—'I would recommend to such young men an intellectual regimen, of which I myself, in an earlier period of life, have felt the advantage; and that is, to assent to the two first propositions that they hear every day; and not only to assent to them, but, if they can, to improve and embellish them; and to make the speaker a little more in love with his own opinion than he was before. When they have a little got over the bitterness of assenting, they may then gradually increase the number of assents, and so go on as their constitution will bear it; and I have little doubt that in time this will effect a complete and perfect cure.'

Although we consider the resolution of the whole of the active impulses of man into mere feelings of pleasure and pain, or into products growing out of these, as very indifferent science, yet the author's exposition and delineation of the affections, passions, desires, and habits, makes very good reading. If, for example, his explanation of the emotions of tragedy is not very philosophical, his illustrations of it are very acceptable:—'I have no doubt that to an Indian audience the loss of a piece of venison might be the basis of a tragedy which would fill every eye with tears; but, on the contrary, they might be very likely to laugh to hear a man complain of his wounded honour, if it turned out that he had ten days' provision beforehand in his cabin.'

The work concludes with a passage of powerful eloquence on the influence of the passions. A portion of it is all we can make room for:—'The passions are in morals what motion is in physics: they create, preserve, and animate; and without them all would be silence and death. Avarice guides men across the deserts of the ocean; pride covers the earth with trophies, and mausoleums, and pyramids; love turns men from their savage rudeness; ambition shakes the very foundations of kingdoms. By the love of glory, weak nations swell into magnitude and strength. Whatever there is of terrible, whatever there is of beautiful in human events, all that shakes the soul to and fro, and is remembered while thought and flesh cling together—all these have their origin from the passions. As it is only in storms, and when their coming waters are driven up into the air, that we catch a sight of the depths of the sea, it is only in the season of perturbation that we have a glimpse of the real internal nature of man. It is then only that the might of these eruptions shaking his frame, dissipate all the feeble coverings of opinion, and rend in pieces that cobweb veil with which fashion hides the feelings of the heart. It is then only that Nature speaks her genuine feelings; and, as at the last night of Troy, when Venus illumined the darkness, Æneas saw the gods themselves at work, so may we, when the blaze of passion is flung upon man's nature, mark in him the signs of a celestial origin, and tremble at the invisible agents of God!'

The tendency of a perusal of the whole book is to confirm our previous impressions of the author's character, and perhaps to enlarge our notions of his scientific and metaphysical capacity. Although a man of powerful intelligence, the addition of equally powerful feelings prevented him from being a dry and subtle intellectual machine. He had a warm and generous nature, shown to the general public in his love of liberty, and his intense hatred of everything intolerant and bigotted. His love of knowledge, modified by strong human sympathies, made him an extensive reader of poetry, histories, travels, and delineations of mankind; of all which he could avail himself reproductively in enriching and enlivening his own writings with eloquence and wit. We can trace likewise a few of his favourite subjects of ludicrous illustration and banter. The antediluvian longevity especially took his fancy; and among the standing objects of his fire was the medical profession, on whom perhaps the severest of

his many allusions was that where he recognises a college of physicians, or other licensing corporation, as at one stroke dispensing with the sixth commandment over the three kingdoms.

NOTES ON MUSIC.

It was a remark highly characteristic of the rustic but original genius of Bunyan, that 'as far as human knowledge or notions went, only man, small birds, and angels, had the power of singing.' To some human notions, the grouping, in which man occupies the lowest place, would appear rather invidious; but perhaps the popular allegorist gave it according to his own estimation of musical merit. There have been those who preferred the singing of birds to that of their own species. It was probably the first earthly harmony, and it has flowed on without change or discord through a thousand generations. Heard no matter where, it is still associated with all the memories of greenwoods and fields, which peasant men have known, and poets bequeathed to the world. Who does not remember Wordsworth's picture of the country maid lingering to hear a thrush sing in a London alley, and dreaming of the dell where she had heard such music last?

Naturalists say that birds sing only for joy, and it may be so, in spite of dingy rooms and cages; but human song has a range as wide as that of thought and feeling, and a voice for every variation of our outward or inward life. Doubtless music is intuitive to man, as it is to the thrush and the redbreast, but analogous to the more extensive laws of his progressive existence. All nations sing; and in the lowest stage of civilisation are found rudiments of the harmonious art in the form of air or tune. Among mere savages these are generally monotonous. A missionary mentions that he heard a native of New Guinea sing for upwards of an hour the praises of his deceased chief, but the air was entirely composed of two notes—A on the ascending, and B on the descending scale—being repeated in regular and constant succession. The performer accompanied his song by as regularly rising on the toes of one foot, and sinking on the other; but this companionship of melody and motion is as ancient as song itself, and evidently the parent of dancing.

Among the ancient Greeks various pantomimic gestures were the prescribed accompaniments of different kinds of music, and sometimes one person performed while another gesticulated. Instrumental accompaniments of some description are also known among the rudest tribes: perforated reeds, ox-horns, and great sea-shells, are the most primitive assistants of harmony. Among old and early-civilised nations it is remarkable how little proficiency was made in the construction of musical instruments. The Egyptian flute was only a cow's horn with three or four holes in it, and their harp or lyre had only three strings. The Grecian lyre had only seven strings, and was very small, being held in one hand. The Jewish flute was the same as the Egyptian. Their trumpet was a ram's horn; and they had no other instrumental music but by percussion, of which the greatest boast was the psaltery, a small triangular harp with wire strings struck with an iron rod. According to Josephus, two hundred thousand musicians with such appliances performed at some of their great national festivals; and the effect on modern ears may be imagined.

Of all the numerous instruments employed in our times, the oldest and most widely-known are the drum, harp, and bagpipe. The first of these, simple as its construction is, has literally played an important part in music. It originated in the north of Asia, and was for more than two thousand years the only instrument known to the rude and roving Tatars. They used it alike in war and in worship, attributing to its sound some mystic influence in the conquest of their enemies and the propitiation of their gods. In the memory of neighbouring nations it was for ages connected with the

devastating marches of Genghis Khan and Tamerlane; and the frontier villages of Hungary and Poland long retained traditions of the Tatar drum, heard through the wilds at midnight, and believed to be beaten by evil spirits. From the Turcoman hordes the Crusaders introduced it into the military bands of Europe, which before their time consisted only of trumpeters; but something of the Tatar trust seems to have attended its progress in Christendom, for a historian of the period gravely attributes the capture of Constantinople by the Venetians to the fact, that they advanced to the assault with a mighty sound of drums, which so terrified the Greeks, that they believed the skies were falling, and took no thought for their city. The wild tale of John Tisca, a Bohemian leader of the fifteenth century, who was said to have laid a dying injunction on his followers to construct a drum of his skin, in order that he might still serve against their enemies, though scarcely authentic, bears witness to the ancient prestige of the drum; and it is curious that Napoleon employed twice as many drummers as were ever before retained in the French army.

The harp is of very doubtful origin. Some say it was invented by the Harpii, an ancient people of Italy, from whom its name was derived; others that it was a product of Scandinavia; but certain it is that this instrument was in special honour and request among all the Celtic nations. By the ancient laws of Wales, it was one of the three things the possession of which constituted a gentle, or rather a free man, and which could not be seized for debt, as their disappearance would infallibly occasion a loss of caste to the owner. The remaining two were a horse and a sword, but the harp was the principal; and in the spirit of tyrannical barbarism, it was forbidden that the peasantry—who were all serfs—should ever be taught its use. In Ireland the harp was invested with a sort of prophetic power. One tradition relates that at a feast given to the O'Neills by the lords of the English Pale, an Irish bard was warned of intended treachery by his harp, on which he could play nothing but a wild war-tune, when endeavouring his best to enliven the festival. The harp is believed to have been used in Scotland before the introduction of the bagpipe, though that is of considerable antiquity. The latter instrument is remarkable as being known to the most distant times and nations. The rustic deity Silenus is represented in antique bas-reliefs as summoning his worshippers by the sound of the bagpipe; the Italian peasants of the Abruzzi play upon it before their household image of the Virgin on festival eves; and it is the principal instrument of the Celestial Empire.

In Gothic sculpture and tracery angels are sometimes portrayed practising on the bagpipe. It was occasionally used in churches before the introduction of the organ, which occurred early in the fifteenth century. Written music came into use about the same time, and both were loudly denounced by many of the old schoolmen as unnecessary and vain innovations. Speaking of sacred music, it may be observed that metrical hymns and choirs were first introduced by Gregory the Great; and previous to his day a kind of chant or recitative only was employed. We also owe our present gamut to an ecclesiastic of the eleventh century, and its name originated from a note which he designated by the Greek letter gamma, identical with our G.

The crude and complex state of musical notation in earlier ages may be guessed from the fact, that the polished and ingenious Greeks had no less than nine hundred and ninety notes in their scale. The earliest mode of printing music was by means of plates. Some of them, made of wood, are still extant, and were cut in the year 1473. Since the invention of our gamut, church music particularly has made rapid progress, and no system of religion has ever yet received so much of song into its service as Christianity—thus proving the friendship of the latter to the most elevating of natural influences. The practice of vocal music has been always

popular, even with sects that extended no patronage to the other fine arts. The Methodists, with all their varieties in England and America—the Moravians and Mennonites of Germany—are rich in the quantity if not the quality of their hymns, and proverbially harmonious singers.

Savages have no song, as we employ the term, their performances being strictly occasional pieces. The Indian chief sings his death-song, and the African mother apostrophises her departed child; but all are extemporary—a passing expression of the feelings of the moment, through which at times, though rarely, there shines a vein of native but rude poetry, which is neither recalled nor transmitted. There is no substitute with them for the popular verse and refrain, which our peasant of a former age learned from his mother, or conned from the broadsheet, and which a few pence will now purchase by scores, with comments and airs attached. Songs, however, appear in a comparatively primitive stage of civilisation. A traveller in Nubia some years ago made an English translation of one of that country's songs. It was sung by a native who had joined his company in Lower Egypt, but remained subdued, and almost silent, till the frontiers of his land were gained, when his spirits suddenly rose, and he astonished them all by volunteering to sing as the party sat round their evening fire. His song exhibits a most familiar vein of Nubian life, and a glimpse of those better doings which, though but scarce at the best, it is possible to meet with in every gradation of humanity. Therein a lady, whose early attractions had been stolen away by successive years, relates her husband's determination to displace her in favour of a younger spouse, and his chagrin because, though a divorce was easily obtained, yet the poultry, which constitute the best part of a Nubian peasant's property, are always the first wife's jointure, and would be carried off by her. Under these circumstances the refrain—'Isn't my hen-house dear to me?'—seems both natural and appropriate. But the dame goes on to tell, that finding her husband hopelessly smitten by the new face, she resolved to be no longer in his way, but 'Went her rival home to call, and gave her henhouse, hens, and all;' on which the African worthy, either learning at last the real worth of what he was about to lose, or suspecting, with sagacious selfishness, that her youthful successor might prove less devoted, absolutely refused to admit the latter to possession, and induced his old wife to remain, with a promise of never again wavering in his allegiance 'till men should comb his burial locks: so now success to hens and cocks,' concludes the lady, with another reference to her esteem of the henhouse. 'The air,' says its translator, 'was light and lively, and I have heard many like it in Nubia.' It is indeed remarkable that African attempts at music are generally of a similar character, even to the negro melodies, with all the alterations and additions to which they have been subjected by American and British performers.

It has been well said that the history of most European nations might be gathered from their songs. This is pre-eminently true of Britain; every change in her public mind or political state may be traced for centuries through the floating fragments of songs and ballads. The destroying War of the Roses, the tumults of the Reformation, the Spanish Armada, and the protracted strife of Cavalier and Roundhead, with its intervening fear of popery—all have been chanted, down to the Revolution of 1688, the Jacobite Rebellions, and the dread of Bonaparte. It is strange to meet in those old airs and rhymes the themes that agitated perished generations, and are now scarcely remembered; but they are almost the only medium through which glances can be caught of the mental history of the masses, unrecorded as it is by either sage or chronicler. Legislators, especially in untaught and arbitrary times, often put forth their power against adverse songs.

It is remarkable that Asia has no political songs. Empires have risen and fallen, creeds prevailed and

sunk, without leaving a single rhyme in the memory of the people; but this is characteristic of all despotic states. Italy, with her acknowledged musical genius, is known to have the fewest political songs of any country in Europe, excepting Russia, where the burthen of all the peasants' ditties is the grandeur of the czar and the exactions of the boyards; but these lays have little variety.

In countries more advanced, every movement has its songs, and those of different periods vary considerably in the quality of the composition. The best songs of Spain relate to the Moorish times; of France, to the days of the Empire; and those of Germany belong to the present century. Of the British kingdoms, Scotland has the richest treasury of songs, both old and new; while the entire singing stock of England is remarkably inferior; and the finest songs of Ireland are those of discontent and agitation. The affinity of Scottish and Irish music is a matter of notoriety, and their similarity seems strange, considering the difference of national history and character; but both had their well-springs in the Celtic times, when the isles were occupied by one people. The popular airs of Ireland are almost entirely of Celtic origin; and it is remarkable that after the lyrical contributions of Moore, and many less celebrated poets, a great number of them still remain without words. Whether the verses to which they were adapted have perished in the decay of the Gaelic language, or whether they ever had any, is not now ascertainable; but they continue to prove the immense proficiency of the Celtic race in music compared with their progress in any of its sister arts, or in literature. Yet the composers were, as among every primitive people, poets also—the title of bard always including both professions; and under this denomination the English governors issued several severe edicts against them, as idle vagabonds and fomenters of rebellion. The order, however, lingered on till comparatively modern times, evincing considerable genius, and wearing their *cauback*, or canonical dress, which must have originated in an early stage of civilisation, as it consisted of a robe and mantle entirely composed of plaited rushes, with a conical cap and tassels of the same. The last who appeared thus attired in public was Jerome Duigenan, who lived about the middle of the last century; and the occasion was that of a musical combat between him and a Welsh harper, which came off in the Irish House of Commons before the hours of business, and was attended by all the members.

It is worthy of remark, that though music and poetry have always been united in the earliest ideas of nations, and the oldest poems, even those of Homer, are said to have been sung by their author, yet, since the revival of literature in Europe, there has appeared no individual who was great in both departments. On the contrary, many persons eminent for poetical abilities have been regardless of music as an art; admiring more the simple peasant airs of their respective countries than the most elaborate opera or difficult sonata. Sir Walter Scott cared only for songs the words of which pleased him; Byron said that to him opera music seemed only a succession of extraordinary sounds; and Goethe listened to nothing with such pleasure as the old songs and hymns of Germany. Philosophers have rarely been partial to artistic displays of music. Lamorte used to say that 'life was too short to expend part of it in learning to make a noise.' But he had no ear for harmony, vocal or instrumental.

The first attempts at opera music were made at Florence in 1597; but it was rather an imitation of the chant employed by the ancient Greek chorus, and sometimes used in the most serious subjects. The father of Galileo the astronomer composed in a similar manner music for the entire Lamentations of Jeremiah, and sang them to his violin in presence of large assemblies. All the dramas of that period were on religious subjects; but the oldest of the operatic kind is said to have been performed at Venice in honour of Henry III.,

when he visited that city on his journey from Poland, the throne of which he had resigned to receive the crown of France. Those compositions were followed by the masques, so dear to the courts of Elizabeth and all her successors, till the accession of the Hanoverian line, when something like the present theatrical music began to exist.

NEGLECTED CHILDREN.

WE have occasionally drawn attention to the fact, that chiefly through the exertions of Sheriff Watson, Aberdeen took and has kept the lead in the matter of Schools of Industry for reclaiming vagrant children. Those who take an interest in this subject will be glad to learn that success the most eminent has attended the operation of these schools. With slender funds picked up from the benevolent—the bulk of the people giving nothing—the schools have weathered every difficulty, and the results exceed all ordinary expectation. To show the good effects which have been produced, we may state a few facts gathered from a printed paper just put into our hands, purporting to be an abstract of certain particulars respecting the rural constabulary of Aberdeenshire from April 1841 to April 1850.

The vagrants apprehended in 1841 were 928 men, 1203 women, and 328 children—total 2459. From this year there is a gradual but small decrease till 1845, when the Industrial Schools were fully in operation. After 1845 the decrease of vagrancy becomes remarkable. In the year ending April 1846, the vagrants apprehended were 510 men, 617 women, and 14 children; in 1847, 381 men, 531 women, and 6 children; in 1848, 429 men, 458 women, and 6 children; in 1849, 505 men, 400 women, and 1 child; and in 1850, 523 men, 387 women, and 2 children. Thus, in nine years, the total number of vagrants has sunk from 2459 to 912. The most marked decline, however, is in the number of vagrant children, which has sunk from 328 to 2. Practically, juvenile vagrancy and crime have been extirpated in Aberdeenshire. Perhaps this result is not altogether imputable to the Industrial Schools: we observe that from 1841 to 1850, the number of rural constables has increased from 17 to 37 (expense of constabulary increased only from £1185 to £1385), and a sharper practice of picking up vagrants, or turning them back at the borders of the county, may have had its due influence. At all events, these are the facts, which offer matter for serious inquiry and consideration.

From a variety of papers which have reached us, we are inclined to believe that the subject of juvenile pauperism, vagrancy, and crime, has been more closely and practically investigated in Aberdeenshire than elsewhere. The success of the Schools of Industry in that part of the country has suggested to their supporters that the whole state of the law in relation to young criminals is defective. For example, to take up a deserted and ignorant child for stealing, and deal with him as if he were a responsible being, is believed to be a scandalous abuse of power, and, to say the least of it, demoralising; for, as destitute children are better treated in prison than out of it, they care not how often they are convicted and imprisoned. According to Mr Watson, there are at all times and in all places a certain number of improvident and wicked parents, who pay no attention whatever to their children; leave them to beg, or steal, or to play about the streets all day long; and who would, on the whole, be rather glad if their progeny died than otherwise. The law provides no sort of punishment for these monsters. It takes a parent to task for deserting his child; but there is a kind of misusage infinitely worse than desertion, and it is this the law neglects. Take a case that lately came under our notice. A widower in good health and employment took no care whatever of his children. They were taught nothing, and knew nothing. Allowed to go in rags, these rags were never taken off; the poor little creatures huddled together for warmth among

dirty straw at night, and they vagranded during the day; if they got any food at home, it was chiefly raw meal. The charity of neighbours ultimately did something to mitigate this dismal state of affairs, but the law could not get at the parent. If he preferred bringing up his children like wild beasts, it was nobody's business. Now what is wanted is a power of reaching persons of this class. Whether their negligence arises from natural weakness of mind or from perversity, is of little consequence; the harm they inflict on society is the same. To this class of persons, various in their degrees of improvidence, may be traced the great mass of juvenile wretchedness and precocious depravity. It will be said that Schools of Industry, by administering food as well as instruction to vagrant children, must have the effect of augmenting the number of improvidents. But with judicious management this result is not observable. Sheriff Watson tells us that the number of improvident parents is not sensibly increased in Aberdeen. If we understand him rightly, improvidence exists in a fixed quantity: in every population, look after it as you will, the stock of improvidence keeps up. The means adopted to check intemperance, to cultivate and refine feelings, will in time, it is to be hoped, lessen the proportion of drunkards and bad managers; but at present we must take society as we find it, and legislate accordingly.

But on whom should the duty fall of rectifying an evident and gross abuse? A certain number of badly-behaved persons turn their children into the streets; these children are so much of a nuisance, that benevolent persons, though not well able to afford it, catch them, send them to school, and give them food and education—their only reward being the hope of checking crime in the bud. These people are clearly doing what the public should do: they are giving themselves a world of trouble with what is properly no business of theirs as individuals.

Against this burthen upon private charity we raise our unqualified protest. If it is the duty of society to hang felons, it is equally the duty of society to prevent children from growing up to be felons. In some measure to reach the evil, Mr Watson and others connected with the Aberdeenshire Prisons Board suggest that a law should be enacted to give magistrates the power of capturing vagrant and neglected children, and sending them to an Industrial School, with recourse against the parent, or against the parish if the parent is a pauper. When the child is incorrigible, and repeatedly deserts the school for the sake of vagabondising, the sheriff, with the concurrence of a jury of seven persons, shall be entitled to pronounce a sentence of expatriation. According to the proposed bill, the exile is to be subject for a time to a colonial school of reform; but as this would involve a heavy expense, it might be sufficient that he was apprenticed in the colonies to any respectable party who might desire his services. There may be objections to the expatriating part of the plan, but none, we think, to the scheme of compulsory attendance at school at the expense of the parent. So far we cordially assent to the proposal. A child put into prison costs the country £20 per annum; whereas the cost of his maintenance at an Industrial School is but £5 per annum; at Aberdeen it is only £3, 10s. We almost fear, however, that the proposal to substitute prevention for punishment of crime has little chance of meeting serious attention from the legislative mind of the country. Members of parliament, from their habits and associations, are not yet prepared by out-of-door discussion to give heed to the subject; and we regret to learn that one of the metropolitan daily papers has thought fit to throw out suspicions as to the efficacy of Ragged Schools in preventing crime; indeed the said paper rather goes the length of averring that these schools, by promoting the intercourse of the vicious, tend to foster crime among the juvenile wanderers of the streets. This allegation is doubtless far from the truth. Ragged or Industrial Schools, when carefully conducted, as we believe them

generally to be, are effecting no small good; though it is tolerably clear that until some practical and cheap plan of removing neglected children to fields of usefulness in the colonies be adopted—for it must come to that—the system of reclamation will remain incomplete.

We are able to state that in Edinburgh, and also in Glasgow, the Industrial Schools which were some time ago established have been the means of reclaiming large masses of poor and neglected children, and lessening the number of criminal cases brought before the tribunals. It must, however, be added, that the streets of the above cities are still disfigured with troops of loitering children in rags, who either will not attend the Schools of Industry, or are, on various grounds, not eligible for admission. To gather up these fragments of the juvenile population, charity schools of a different class make the most earnest and praiseworthy efforts. In Glasgow an attempt has been made to reach the utterly neglected children of the streets by means of Sunday schooling. The association which professes to follow out this plan appears, from a report that has come into our hands, to have been remarkably successful. At present two schools are in operation: they are conducted by 24 teachers, who act gratuitously, and are attended by 250 children. No child is admitted who attends any other school. The benefits of the institution are open only to 'destitute and neglected orphans; to children whose parents are unable to pay for their education, or indifferent whether they receive any; to such as are sent early to work, and who, from exhaustion of body, if taught at all, must be taught on Sunday; in short, to the poorest, the most ignorant, the most helpless children that can be got.' The progress made by this benevolent scheme—which embraces instruction in reading, writing, arithmetic, and geography, along with a simple kind of religious and moral admonition—is stated in the report to be very gratifying. A collection of disorderly and ignorant children has, by dint of culture, been transformed into a body of well-behaved youth, fitted for earning their bread in a creditable manner.

We have had no opportunity of knowing anything personally of these schools, but should hope they meet with the encouragement of benevolently-disposed individuals. They show what can be done by zeal tempered with the kindest spirit of Christianity; reminding us of what has been done elsewhere—Aberdeen for one place—in getting up Ragged Churches—a new class of places for public worship on Sundays, which have been opened exclusively for the benefit of the neglected, the ragged, the miserable—that great non-descript class whose harbourage is on the confines of crime and poverty, and with which every large city alarmingly abounds.

THE NAMELESS SHELL.

On the Boulevard Montmartre, in Paris, may be seen a shop devoted to the sale of various curiosities in natural history. There is constantly a group of persons outside the windows, attracted by the articles exhibited; and when you open the door, and enter, you find presiding within not an ordinary shopkeeper, but an accomplished artist. Very rarely is he to be found alone; his magazine being a regular rendezvous for travellers, artists, naturalists, and authors—in short, for all the literary celebrities of Paris. Jemning, already the glory of natural science; Wilson, the principal former of the Museum in Philadelphia; Philippe Rousseau, who paints animals to the life; Delgorgue, the intrepid elephant hunter; Gray, so distinguished amongst English naturalists; Mitchell, the director of the London Zoological Gardens; Henri Mounier, the rival of Moirère; Alphonse Rarr; Deshayes, perfect master of conchology; Lafresnaye, equally distinguished among ornithologists; Emile Blanchard, who devotes his life to the study and dissection of living microscopic atoms; Delamarre Piquot, who searches the remotest quarters

of the globe for alimentary substances wherewith to enrich Europe; M. Michelin, who devotes his leisure hours to the collection and classification of rare polypi—these and many others may be found studying, admiring, drawing, and describing the strange animals which, from all parts of the world, are consigned to the shop on the Boulevard Montmartre; thence to be distributed among the collections of Europe and America.

Undisturbed by the buzz of brilliant conversation continually going on, the master of the establishment does not lose a single moment: he gives orders, he classifies, describes, and sends off his treasures, frequently as gifts, to enrich various museums. One evening, as he was very busy in classifying a collection of shells, according to the method of Lamarck, one of his visitors, taking up a rare specimen of the *helix*, or snail-shell, said, 'Ah, I can never look at this species without recalling an incident which I witnessed here, and which I will now tell you.'

'I happened to be in the magazine one evening just like this about ten years ago. A lamp from the ceiling, which enlightened the centre, left the corners of the room in deep shade, while the ruddy firelight played fantastically on the strange animals and grotesque objects piled around the walls. The master of the shop, who was then, as now, busily sorting shells, suddenly took one which chance had placed under his hand, and presented it to a tall, gray-haired old man, who had been silently seated in the background. The latter approached the lamp, examined the shell, smiled, sighed, and placed it in his pocket. A slight crash was heard as he quietly resumed his seat. Seeing many inquisitive eyes fixed on him, he said, "I have broken it." And throwing the fragments of the delicate shell on the floor, he ground them to powder beneath his heel.

'For some moments there was a profound silence. It was broken by the old man, who with a sad smile said, "Gentlemen, I will tell you why I have broken this shell. Mine is a strange weakness," he continued; "and yet if I can hope to find indulgence for it anywhere, it must be among you, who are yourselves collectors, and who might perhaps, under similar circumstances, even imitate it. That shell was a *helix*, which has never hitherto been named nor depicted. In my collection I possess the only specimen of it known to the scientific world, and which I purchased ten years ago in this magazine. The first time that I saw this unique shell my heart beat quick with joy. I was poor, but at any price I must possess it. Intoxicated with joy, I carried it home, and I passed whole days in contemplating it, studying it, and examining its most minute details. It took me two years to pay its price—two long years of privation. Every month I brought in a small sum, often saved from the necessities of life. But what signified that? I possessed the shell; it was mine alone; no one could show another similar! I would not allow it to be described; when I showed it to some few of the initiated, it was on the condition that they would not mention it in their Fauna. Never was devoted lover more blindly jealous of his beloved one than I was—than I am of my *helix*!

"Shortly after I had paid its price in full, I strolled in here one evening as usual. Happening to open a case of newly-arrived shells, I started back with a loud cry. There I beheld a *helix* precisely similar to my own! Fancy my grief—my despair! My treasured shell was no longer unique—some other collector would possess one similar! Although very poor, I did not hesitate: I purchased the *helix*, and carried it home; but this time without any joy of heart. I possessed a few good pictures, an old and cherished family inheritance; these I sold to pay for the second shell, which, as soon as it became mine, I ground to atoms.

"Three years passed on, and want pressed heavily on my old age. The failure of a bank deprived me of a sum which had served to eke out my trifling pension, and enable me from time to time to add a few good shells

to my collection. Cut off from this resource, my sole enjoyment consisted in contemplating my beloved shell; never was I tired of examining my *helix*! Never shall I forget the sickness of heart which oppressed me when one evening I saw in yonder cabinet *three shells* like mine! I took them quietly in my hand, examined them carefully, and gave them back to our friend, their owner. 'I cannot buy them,' said I. He looked at me earnestly, and saw my paleness and my tears; for, gentlemen, I was weeping like a child. He smiled, took a hammer, and pulverised the three precious *helices*! You all witnessed what he did just now. May God bless him for his disinterested kindness towards an old friend! I should die of despair, gentlemen, if I thought any one else possessed a *helix* like mine." So saying, the old man rose and went out, wrapping himself up in his tattered mantle.

'Four years ago death separated the old conchologist from that which formed his life: one morning he was found stiff and cold seated before his cabinet, his glazed eyes still fixed on the beloved shell. His collection was purchased by our friend, who had shown such considerate sympathy for the old man's jealous weakness; and, strange to say, up to the present time no other *helix* of the same kind has been brought to Europe. To an uninitiated eye the shell has nothing either curious or beautiful in its appearance: its rarity forms its sole value. At this moment one of our most learned conchologists is engaged in classifying and describing it: he also intends to publish a drawing of its form. I hope that, in memory of its first possessor, he will call it the *Helix Innominata*—the Nameless Snail-Shell.'

EMIGRATION UNDER DIFFICULTIES.

An interesting story is told by the 'Glasgow Saturday Post' of the adventures of a young lady, Miss Mary Brown. She was the daughter of a gentleman lately dead, and inherited a small property from him, on which she lived. Her only near relative in Glasgow was a 'ne'er-do-weel' brother, a cab-driver, who, having himself been disinherited, constantly teased her, and extorted money from her. Having friends in America, she determined to emigrate, and took her passage by the City of Glasgow steamer, which left on Tuesday. Her brother, disappointed and vexed at her intended departure, formed a scheme to detain her. A trumpety claim was reared up, and a *meditatione fugæ* warrant applied for. This he swore to, and got the warrant. Armed with this authority, and attended by two sheriff's officers, he watched the sailing of the vessel. Miss Brown, with her friends, was on board; they remained with her till the signal for sailing was given, and, bidding her farewell, they went on shore, and walked down the quay. Now was the cab-driver's opportunity. Seeing his sister deserted by her friends, and no help at hand, he sneaked on board the vessel, and caused her to be apprehended in presence of the passengers, the ship's crew, and the immense multitude of onlookers. In vain did she remonstrate against such shameful conduct—violence was resorted to, and she was dragged on shore, and, refusing to listen to their proposals for letting her off, she was carried before Sheriff Bell. The sheriff, after hearing the evidence, detected the trick, and dismissed the case. She left the sheriff's office, and met her friends: she was now freed from her tormentors. A new dilemma arose. The vessel had sailed—Miss Brown's passage was paid, and all her luggage on board. To overtake the vessel seemed hopeless, but still she was resolved to make the attempt. Hiring a cab, she drove to the Greenock railway station, and finding a train on the point of starting, was speedily conveyed to Greenock. Fresh misfortunes seemed to arise—the City of Glasgow steamer had passed Greenock nearly half an hour before the arrival of the train, and was seen slowly steaming past Gourock. A Gourock steamer was leaving the quay, and Miss Brown went on board of it. The Gourock steamer was rapidly overhauling the huge City of Glasgow, when all on a sudden the latter was seen to 'bout ship,' and steam towards Greenock. The cause of this sudden change arose from an accident which happened to the oil cistern on board. A steam-tug was despatched to Greenock for a fresh supply of oil, and hence the delay which proved so fortunate for the persecuted orphan. Taking a small boat, Miss Brown was rowed

towards the vessel, and received on board amid the cheers of the passengers. A new matter of consternation now arose: the captain, thinking she would not get away, had landed all her luggage at Greenock, and there was no hope of getting it. Further vexation was put an end to by the return of the tug carrying the oil, with all Miss Brown's luggage on board. Certain friends at Greenock had seen her luggage on the quay, and forwarded it with the tug. Thus were all further impediments happily got over.—*Newspaper paragraph.*

MECHANICS' INSTITUTIONS AND TAXES ON KNOWLEDGE.

There is another subject connected with the general taxation of the country in which the interests of all Mechanics' Institutions are deeply involved, and respecting which, without departing from their neutrality on political questions, they ought certainly, particularly at the present time, to make their views known by petitions to the legislature. These taxes are the duty on paper, on advertisements, and the stamp on newspapers. To these all the institutions are, necessarily, large contributors; for after paying rent, salaries, and lecturers, nearly all the remaining expenditure is for books, newspapers, periodicals, printing, and advertising. There are thirty-six institutions in Lancashire and Cheshire that take 109 weekly, 262 monthly, and 43 quarterly periodicals; 86 daily, and 327 other newspapers. The cost of these is about one-sixth of the entire revenue, and the tax upon the newspapers alone is equal to 3 per cent. on the income. This of course is quite irrespective of the paper duty, that enhances the price of books, periodicals, and printing; and of the advertisement duty, that in many instances prevents that publicity being given to the nature and proceedings of the institutions so essential to their welfare. On the smaller institutions these taxes press heavily; and there is no doubt that their repeal would greatly increase the prosperity and usefulness of all.—*Report of the Central Committee of the Lancashire and Cheshire Union of Mechanics' Institutions.*

ZOOLOGY OF AUSTRALIA.

Geological researches into the structure of the globe show that a succession of physical changes have modified its surface from the earliest period up to the present time, and that these changes have been accompanied with variations not only in the phases of animal and vegetable life, but often in the development also of organization; and as these changes cannot be supposed to have been operating uniformly over the entire surface of the globe in the same periods of time, we should naturally be prepared for finding the now existing Fauna of some regions exhibiting a higher state of development than that of others; accordingly, if we contrast the Fauna of the old continents of geographers with the zoology of Australia and New Zealand, we find a wide difference in the degree of organization which creation has reached in these respective regions. In New Zealand, with the exception of a *Vespertilio* and a *Mus*, which latter is said to exist there, but which has not yet been sent to this country, the most highly-organized animal hitherto discovered, either fossil or recent, is a bird; in Australia, if compared with New Zealand, creation appears to have considerably advanced, but even here the order *Rodentia* is the highest in the scale of its indigenous animal productions; the great majority of its quadrupeds being the *Marsupialia* (kangaroos, &c.) and the *Monotremata* (*Echidna* and *Ornithorhynchus*), which are the very lowest of the mammalia; and its ornithology being characterised by the presence of certain peculiar genera—*Tulegalla*, *Leipoa*, and *Megapodius*; birds which do not incubate their own eggs, and which are perhaps the lowest representatives of their class; while the low organization of its botany is indicated by the remarkable absence of fruit-bearing trees, the *Cerealia*, &c.—*Gould's Birds of Australia.*

NEGLECTING THE ANTECEDENT.

Some very whimsical instances of this occur continually, especially in the answers of witnesses when given literally as they speak. In a late assault case the prosecutor swore that 'the prisoner struck him with a broom on his head till he broke the top of it!' In narrating an incident some time since, it was stated that a poor old woman was run over by a cart *aged sixty*. So in a case of supposed poisoning: 'He had something in a blue paper in his hand, and I saw him put his head over the pot, and put it in!' Another, swallowing a base coin: 'He snatched the half-crown from the boy, which he swallowed;' which seems

to mean the boy, not the money. An old fellow, who for many years sold combustible matches in London, had the following cry: 'Buy a pennyworth of matches of a poor old man made of foreign wood!'—*New York Christmas Bell.*

DO NOT WEEP.

I ONCE was young, but now am old; I once was fair, now gray;
A summer child, for I was born upon a summer day.
Our home stood in a valley lone—it was an ancient hall—
With slanting roof, and gable sides, and ivy on the wall.

Not more unruly sure was I than petted children are,
Though I was nurtured with far more than usual love and care;
A faithful nurse watched over me from when I first saw light,
And ceaseless was her tending love throughout the day and night.

A picture hung within the hall—'twas of the Holy Child;
I used, as evening shadows fell, to think the blest One smiled;
And when with awe I told my nurse, she said, 'Remember this—
The gracious Saviour never smiles on those who do amiss.'

Sometimes, with childish fits oppress—in frowardness or pain—
Recounting my imagined woes, 'twas pleasant to complain;
By tender accents reassured—'Be patient—do not weep:
Perchance the angels may come down with healing in your sleep.'

My heart received the portraiture, though oft it disappears,
Reviving with the sacred warmth of penitential tears;
And at the solemn midnight hour bright visions still reveal
The smile of bliss ineffable whose influence I feel.

As years bring sorrow in their train, dim smiles, and stifled sighs—
Imaginary grief dispelled by stern realities—
A haunting voice yet seems to say, 'Be patient—do not weep:
Perchance the angels may come down with healing in your sleep.'

C. A. M. W.

BOOK-TRADE OF THE EAST.

We have learned with pleasure that the Board of Education is extending the number of its publications in the native languages. After all that can be said for our English (and much can), it must be owned that neither here nor anywhere can the body of any people be addressed to a good purpose but in their own tongue. The art of printing has made great advances of late years in Bombay—particularly the lithographic branch, for which the chief Eastern languages are well adapted. We were told the other day that as many as six different editions of the entire Koran in Arabic have been lately worked off in Bombay, consisting in the aggregate of about 15,000 copies. There is great facility for such work in Bombay, and 'the freedom of the press' must thus already be dear to nations who only enjoy it from a distance. The Koran, we are told, thus printed in Bombay, is despatched to Persia, Arabia, &c. and instead of costing fifteen, twenty, or thirty rupees each, as very ordinary copies used to do, now sells for three, and sometimes two rupees, with a good profit to the printer. In this way Bombay may now be considered the book-store of a great part of Central Asia. It is strange to think that the arts of Christians should thus be used in spreading so much of idolatry and error. But as the sun shines on the just and on the unjust, so are these arts applied for good purposes as well as bad. It is consolatory to know that good will be the crowning result.—*Indian paper.*

'MORNING DREAMS ARE TRUE.'

SHAKESPEARE talks of attempting impossibilities, yea, getting the better of them; and the expression has been set down by some as a specimen of the figure of speech not uncommon among great authors, and termed in the vulgar Nonsense. We do not coincide in this view. We think, on the contrary, that there is a strain of philosophy in the seeming paradox. The impossible, or what is termed such, is not an entity, but merely a condition. What is impossible to one man is easy to another; and the impossibilities of one age are commonplace transactions in the next. The imagination does not create, but merely exaggerate and combine, and thus its wildest dreams, dealing as they do, so far as materials are concerned, in the real, turn out not unfrequently to be prophecies. But the world is slow in recognising its seers, and many a truth announced in bygone ages has still its place in fable.

It is the custom of the poets of these degenerate days to complain of the loss of their impossibilities, of the flight of their fairies and genii, of the disenchantment of their talismans, and of the general decadence of the preternatural world. The complaint, however, does not prove the absence of the spiritual, but of the faith required to perceive it; and in losing faith, poetry loses its soul. To an enlightened eye, the poetical machinery of the early time has, in our day, a more obvious existence than ever. It is traced in its works. The substance has come that hitherto cast only its shadow before; the impossible is the actual. What we want is not poetry, but poets; and what we have lost is not spiritual agencies, but the quality of vision necessary to recognise them under new forms and new names.

The hard and cold unbelief which distinguishes the present age is one of the most remarkable of its moral phenomena. Surrounded by wonders, nothing to us is wonderful. We despise the faith of the early world because it has been consummated in this; and knowing *how* a miracle is wrought, we deny that it has anything to do with the miraculous at all. With what delighted faith we used to sit on that little bit of Oriental carpet, which, on our forming the wish, conveyed us away hundreds of miles at a pace vastly greater than that of the fleetest courser! As extraordinary was that wooden horse which, on a peg in his shoulder being turned in a particular way, set off with us, like the wind, whithersoever we chose to go. All this passed in imagination. There was no carpet, no horse, no flight; yet everything was as true as the most indisputable truth of science. It merely erred a little in point of time. In those days, we provincials might in reality have sat long enough on a carpet, and turned ever so many pegs, before reaching London by such agency; but now the prophecy has come true—the substance has followed the shadow; and

if we desire to perform the journey, we have only to sit quietly down, and in a few hours we shall find ourselves at a distance of 400 miles, which it took our grandfathers a fortnight's painful travel to reach. What matters it that our carpet is spread on the seat of a handsome carriage?—that our horse is of iron instead of wood—that he breathes smoke and flame—that his snortings are heard at a mile's distance—that, instead of mounting into the air, he flies on and under the earth? These things only add to the poetry of the journey, and indicate the shortcomings of the prophecy. But the one mode of conveyance is endowed with its capabilities by magic, the other by science. And what then? This only proves that science is as wonderful and poetical as magic, if it does not rather show that the two things are identical; that the science of the learned is the magic of the ignorant.

But suppose, as regards this journey performed by the turning of a peg, that some more powerful enchanter, knowing by his art the route the travellers had taken—perhaps a fugitive pair of lovers—had desired to anticipate and astonish them by meeting them full in the face on their arrival—what plan would he have adopted? We cannot tell. The genius of romance never took so bold a flight; it never imagined anything of the sort; and what is an incident of our every-day life, was to it a true impossibility. *Our* lovers may set off when they please; they may travel at the absurdly-impossible rate, as it was deemed a few years ago, of fifty or sixty miles an hour; and on arriving at their destination, they will find themselves recognised, and taken into custody, by a functionary who never saw them before in his life. By and by the same thing will occur with the British Channel for a portion of the route to their supposed haven of rest and safety. The only difference in this case will be, that although they pursue their undeviating course without a moment's pause or divergence, in the very teeth of the wind, the continental minister of the new enchantment will have much trouble to while away the time till the arrival of his expected victims. We know of no fairy tale to equal this. The wonders we despise as our morning dreams, as the obsolete faith of our credulous youth and more credulous forefathers, were mere prologues—or productions, to speak by the card—of exact mathematical lines; and the world, in its onward whirl, has overtaken and gone beyond them without knowing it. Beyond them? Is there any comparison between the electric telegraph and a preternatural courier with seven-league boots? Only seven leagues at a stride! What clumsy enchanters! what slow imaginations! If these are the impossibilities—if these are the lost ministers and vanished faith that are deplored, let us lose no time in catching up the poets like little boys in the street, and sending them to a Ragged School.

Then to think of that fabulous bird on which an adventurous traveller might seat himself astride, and soar up to the clouds, or span the distant mountains! What a poor contrivance was this compared with the aerial ship which now-a-days carries a party of ladies and gentlemen to take the air out of sight of the earth! The roc was not always at hand when wanted; his services were at the best accidental; but the balloon is moored in our own premises, and is ready at a reasonable notice for the voyage. Was there ever a more indubitable miracle than may be performed by a boy's kite enchanted by science into an electrical machine, which brings down a shower of rain, when desired, from some thin, fleecy, feathery cloud that scarcely hides the blue of the heavens? But modern miracles, owing to their familiarity, have ceased to astonish us. If we were told of some good fairy who, to requite the hospitality of a husbandman, sprinkled upon his exhausted field, for which ordinary irrigation could do nothing, a certain magical liquid which made his crops grow as if from a virgin soil, we should smile at the idle dream—unconscious of its being realised every day before our eyes. The most common appliances of our present every-day life would have been the source of superstitious wonderment in former times. A lucifer match would have startled for a moment Lucifer himself; but what would the world have said, only a little while ago, if some modern magician had proposed to light our streets and dwellings by means of a thing without visible or tangible substance?

Some of the miracles of former times have a more recondite affinity with those of the present. Such is the salve applied to the eye which enabled it to see the treasures of the subterranean world. This salve has with us only a spiritual meaning: it is geological science, which opens the eyes of ignorance, and points out the localities where the mineral riches we seek are to be found. But there would be no end to such analogies. The retinue of Cinderella herself would be merely the charms and graces of good temper; her jewels, her own beaming eyes full of love and kindly feeling; and her glass slipper, the measure of sympathetic beauty which the prince carried in his heart. It is the business of poetry to discover these occult meanings of fable; but it is that of philosophy to inquire into the instinctive yearnings of the human mind after a dominion beyond the grasp of its age and knowledge. Thousands of years ago the world prophesied, though unconsciously even to the prophets, of the achievements of to-day. Faint and feeble were its foreshadowings, and not unfrequently rude and grotesque; but they showed a something inherent in man's nature which spurned at the fetters that controlled it, and made itself a home in the unknown and invisible, as if feeling that there was the future of the race.

Nor was this blind groping, or fierce and frantic grasping of the spirit, without its effect on actual progress. Science owes much to fable, truth to falsehood, faith to superstition. Astrology was the nurse of astronomy; the ignis fatuus of alchemy lighted the path of chemistry; and the wildest dreams of magic had some rays of truth, which in after-times were concentrated into a useful flame. The age which looks with a dull cold eye upon bygone superstitions has nothing promising even in its mechanical perfection. Progress is the history and the destiny of the human race; and knowing this, we must regard with respect the connection between its youth and its comparative maturity.

Our present condition is maturity only in comparison

with the past; it is infancy in comparison with the future. The prosaic character of the age has no existence but in prosaic minds. Old dreams are realised, old impossibilities conquered; but new dreams and new impossibilities arise out of the circumstances of our new position. We were prophesied of by the men of old, and it is our turn to prophesy of the men who are to come. But we have made some advance in the art magic, that is certain. When hundreds of miles out of sight of land, if we desire a cup of coffee, and have no water to make it, what do we do? Why, we merely turn the brine of the ocean into fresh water. But milk?—milk has become a necessary ingredient in a modern magician's coffee. So it has, and he therefore brings it with him to sea in a concentrated form, and a pinch of powder completes the *café au lait*. This, however, is a trifle. With proper appliances beside him, he will extract from solid substances certain invisible and intangible gases, and by means of electricity, resolve them, in the twinkling of an eye, into real water itself. In like manner he teaches the sun to do what that luminary never thought of doing of its own accord: he divides its beams into their actinic, calorific, and luminous components, and may be seen at work with all three—taking portraits with the one, and cooking his dinner with the other, by the light of the third.

No, the days of magic have not gone by, and never will; and the genii of nature will exist as long as nature herself. The region of the unknown and invisible has no sublunary limit; and that age which is destitute of its poets and prophets, of its dreamers and soothsayers, to stimulate the imagination, to elevate the conceptions, to nerve the energies of its pioneers and pathfinders, is destitute of one of the grand elements of progress. The external agent of instantaneous communication between points separate perhaps a thousand miles, is merely an iron wire manufactured by a mechanic—but what is that immortal messenger who makes the iron its path? The early world would have given it a name, a form, a personality, and assigned it a range and a province; but we, who live under a new dispensation in which the former is fulfilled, have nobler superstitions, and aim at grander impossibilities. We imagine that every power of nature of which God has given us any revelation at all is a destined Slave of the Lamp, which may be subdued by study, and watching, and courage, to the power of Man; and that the light, the rain, the thunder, the principles of electricity, attraction, gravitation, will all become ministers of our will. We have already discovered a *Nepenthe*, of which Homer only dreamed; and we endure by its aid the most frightful surgical operations with a smile on our face, and frequently a sensation of enjoyment at our heart. We are now working at a problem, the solution of which (already obtained on the small scale of experiment) will relieve the anxieties we have begun to feel on account of unborn generations on the subject of fuel. The forests will in a great measure give way to cultivation, and the coal-fields in process of time be exhausted; and on this consummation it is our project to burn water instead of wood and coal. This we propose to effect by separating its hydrogen, and combining it with the carbon derived from any otherwise useless substance.

This is only a specimen of the impossibilities of the day; but numerous as they are, we desire to have many more. Without superstition in science we shall never arrive at faith. Youth must precede maturity, and poets philosophers. Our youth, therefore, and our

poetry, must be immortal, since ours is a course of immortal progress; and he who fancies—which many do—that the present age is essentially unpoetical, is a traitor to its spirit, and an impediment in the way of its advance. We know that there are unwholesome as well as wholesome dreams—that there are visions born of indigestion, when the sun is absent from the sky, and the night-hag rides the breast: but these may easily be distinguished by the pain, and gloom, and terror that environ them. The wholesome imaginings of poetry are lofty, radiant, hopeful: they belong to the fresh dawn, to the awaking flowers, to the brightening heavens. Dream thus and then, poets, prophets, interpreters of the age, for 'morning dreams are true!'

L. R.

RECOLLECTIONS OF A POLICE-OFFICER.

THE TWINS.

THE records of police courts afford but imperfect evidence of the business really effected by the officers attached to them. The machinery of English criminal law is, in practice, so subservient to the caprice of individual prosecutors, that instances are constantly occurring in which flagrant violations of natural justice are, from various motives, corrupt and otherwise, withdrawn not only from the cognisance of judicial authority, but from the reprobation of public opinion. Compromises are usually effected between the apprehension of the inculpated parties and the public examination before a magistrate. The object of prosecution has been perhaps obtained by the preliminary step of arrest, or a criminal understanding has been arrived at in the interval; and it is then found utterly hopeless to proceed, however manifest may have appeared the guilt of the prisoner. If you adopt the expedient of compelling the attendance of the accused, it is, in nine cases out of ten, mere time and trouble thrown away. The utter forgetfulness of memory, the loose recollection of facts so vividly remembered but a few hours before, the delicately-scrupulous hesitation to depose confidently to the clearest verities evinced by the reluctant prosecutor, render a conviction almost impossible; so that, except in cases of flagrant and startling crimes, which are of course earnestly prosecuted by the crown lawyers, offences against 'our sovereign lady the Queen, her crown, and dignity,' as criminal indictments run, if no aggrieved subject voluntarily appears to challenge justice in behalf of his liege lady, remain unchastised, and not unfrequently unexposed. From several examples of this prevalent abuse which have come within my own knowledge, I select the following instance, merely changing the names of the parties:—

My services, the superintendent late one afternoon informed me, were required in a perplexed and entangled affair, which would probably occupy me for some time, as orders had been given to investigate the matter thoroughly. 'There,' he added, 'is a Mr Repton, a highly-respectable country solicitor's card. He is from Lancashire, and is staying at Webb's Hotel, Piccadilly. You are to see him at once. He will put you in possession of all the facts—surmises rather, I should say, for the facts, to my apprehension, are scant enough—connected with the case, and you will then use all possible diligence to ascertain first if the alleged crime has been really committed, and if so, of course to bring the criminal or criminals to justice.'

I found Mr Repton, a stout, bald-headed, gentlemanly person, apparently about sixty years of age, just in the act of going out. 'I have a pressing engagement for this evening, Mr Waters,' said he, after glancing at the introductory note I had brought, 'and cannot possibly go into the business with the attention and minuteness it requires till the morning. But I'll tell you what: one of the parties concerned, and the one, too, with

whom you will have especially to deal, is, I know, to be at Covent Garden Theatre this evening. It is of course necessary that you should be thoroughly acquainted with his person; and if you will go with me in the cab that is waiting outside, I will step with you into the theatre, and point him out.' I assented; and on entering Covent Garden pit, Mr Repton, who kept behind me, to avoid observation, directed my attention to a group of persons occupying the front seats of the third box in the lower tier from the stage, on the right-hand side of the house. They were—a gentleman of about thirty years of age; his wife, a very elegant person, a year or two younger; and three children, the eldest of whom, a boy, could not have been more than six or seven years old. This done, Mr Repton left the theatre, and about two hours afterwards I did the same.

The next morning I breakfasted with the Lancashire solicitor by appointment. As soon as it was concluded, business was at once entered upon.

'You closely observed Sir Charles Malvern yesterday evening, I presume?' said Mr Repton.

'I paid great attention to the gentleman you pointed out to me,' I answered, 'if he be Sir Charles Malvern.'

'He is, or at least—— But of that presently. First let me inform you that Malvern, a few months ago, was a beggared gamester, or nearly so, to speak with precision. He is now in good bodily health, has a charming wife, and a family to whom he is much attached, an unencumbered estate of about twelve thousand a year, and has not gambled since he came into possession of the property. This premised, is there, think you, anything remarkable in Sir Charles's demeanour?'

'Singularly so. My impression was, that he was labouring under a terrible depression of spirits, caused, I imagined, by pecuniary difficulties. His manner was restless, abstracted. He paid no attention whatever to anything going on on the stage, except when his wife or one of the children especially challenged his attention; and then, a brief answer returned, he relapsed into the same restless unobservance as before. He is very nervous too. The box door was suddenly opened once or twice, and I noticed his sudden start each time.'

'You have exactly described him. Well, that perturbed, unquiet feverishness of manner has constantly distinguished him since his accession to the Redwood estates, and only since then. It strengthens me and one or two others in possibly an unfounded suspicion, which—— But I had better, if I wish to render myself intelligible, relate matters in due sequence.'

'Sir Thomas Redwood, whose property in Lancashire is chiefly in the neighbourhood of Liverpool, met his death, as did his only son Mr Archibald Redwood, about six months ago, in a very sudden and shocking manner. They were out trying a splendid mare for the first time in harness which Sir Thomas had lately purchased at a very high price. Two grooms on horseback were in attendance, to render assistance if required, for the animal was a very powerful, high-spirited one. All went very well till they arrived in front of Mr Meredith's place, Oak Villa. This gentleman has a passion for firing off a number of brass cannon on the anniversary of such events as he deems worthy of the honour. This happened, unfortunately, to be one of Mr Meredith's gunpowder days; and as Sir Thomas and his son were passing, a stream of light flashed directly in the eyes of the mare, followed by the roar of artillery, at no more than about ten paces off. The terrified animal became instantly unmanageable, got the bit between her teeth, and darted off at the wildest speed. The road is a curved and rugged one; and after tearing along for about half a mile, the off-wheel of the gig came, at an abrupt turn, full against a milestone. The tremendous shock hurled the two unfortunate gentlemen upon the road with frightful violence, tore the vehicle almost completely asunder, and so injured the mare, that she died the next day. The alarmed grooms,

who had not only been unable to render assistance, but even to keep up with the terrified mare, found Mr Archibald Redwood quite dead. The spine had been broken close to the nape of the neck: his head, in fact, was doubled up, so to speak, under the body. Sir Thomas still breathed, and was conveyed to Redwood Manor House. Surgical assistance was promptly obtained; but the internal injuries were so great, that the excellent old gentleman expired in a few hours after he had reached his home. I was hastily sent for; and when I arrived, Sir Thomas was still fully conscious. He imparted to me matters of great moment, to which he requested I would direct, after his decease, my best care and attention. His son, I was aware, had but just returned from a tour on the continent, where he had been absent for nearly a twelvemonth; but I was not aware, neither was his father till the day before his death, that Mr Archibald Redwood had not only secretly espoused a Miss Ashton—of a reduced family, but belonging to our best gentry—but had returned home, not solely for the purpose of soliciting Sir Thomas's forgiveness of his unauthorised espousals, but that the probable heir of Redwood might be born within the walls of the ancient manor house. After the first burst of passion and surprise, Sir Thomas, one of the best-hearted men in the universe, cordially forgave his son's disobedience—partly, and quite rightly, imputing it to his own foolish urgency in pressing a union with one of the Lacy family, with which the baronet was very intimate, and whose estate adjoined his.

Well, this lady, now a widow, had been left by her husband at Chester, whilst he came on to seek an explanation with his father. Mr Archibald Redwood was to have set out the next morning in one of Sir Thomas's carriages to bring home his wife; and the baronet, with his dying breath, bade me assure her of his entire forgiveness, and his earnest hope and trust that through her offspring the race of the Redwoods might be continued in a direct line. The family estates, I should tell you, being strictly entailed on heirs-male, devolved, if no son of Mr Archibald Redwood should bar his claim, upon Charles Malvern, the son of a cousin of the late Sir Thomas Redwood. The baronet had always felt partially towards Malvern, and had assisted him pecuniarily a hundred times. Sir Thomas also directed me to draw as quickly as I could a short will bequeathing Mr Charles Malvern twenty thousand pounds out of the personals. I wrote as expeditiously as I could, but by the time the paper was ready for his signature, Sir Thomas was no longer conscious. I placed the pen in his hand, and I fancied he understood the purpose, for his fingers closed faintly upon it; but the power to guide was utterly gone, and only a slight, scrambling stroke marked the paper as the pen slid across it in the direction of the falling arm.

Mr Malvern arrived at the manor-house about an hour after Sir Thomas breathed his last. It was clearly apparent through all his sorrow, partly real, I have no doubt, as well as partly assumed, that joy, the joy of riches, splendour, station, was dancing at his heart, and, spite of all his efforts to subdue or conceal it, sparkling in his eye. I briefly, but as gently as I could, acquainted him with the true position of affairs. The revulsion of feeling which ensued entirely unmanned him; and it was not till an hour afterwards that he recovered his self-possession sufficiently to converse reasonably and coolly upon his position. At last he became apparently reconciled to the sudden overclouding of his imaginatively-brilliant prospects, and it was agreed that as he was a relative of the widow, he should at once set off to break the sad news to her. Well, a few days after his departure, I received a letter from him, stating that Lady Redwood—I don't think, by the way, that, as her husband died before succeeding to the baronetcy, she is entitled to that appellation of honour; we, however, call her so out of courtesy—that Lady Redwood, though prematurely confined in consequence of the intelligence of her husband's untimely death, had

given birth to a female child, and that both mother and daughter were as well as could be expected. This, you will agree, seemed perfectly satisfactory?

'Entirely so.'

'So I thought. Mr Malvern was now unquestionably, whether Sir Charles Malvern or not, the proprietor of the Redwood estates, burthened as with a charge, in accordance with the conditions of the entails, of a thousand pounds life annuity to the late Mr Redwood's infant daughter.'

'Sir Charles returned to Redwood manor house, where his wife and family soon afterwards arrived. Lady Redwood had been joined, I understood, by her mother, Mrs Ashton, and would, when able to undertake the journey, return to her maternal home. It was about two months after Sir Thomas Redwood's death that I determined to pay Lady Redwood a visit, in order to the winding up of the personal estate, which it was desirable to accomplish as speedily as possible; and then a new and terrible light flashed upon me.'

'What, in heaven's name!' I exclaimed, for the first time breaking silence—'what could there be to reveal?'

'Only,' rejoined Mr Repton, 'that, ill, delirious, as Lady Redwood admitted herself to have been, it was her intimate, unconquerable conviction that she had given birth to twins!'

'Good God! And you suspect?—'

'We don't know what to suspect. Should the lady's confident belief be correct, the missing child might have been a boy. You understand?'

'I do. But is there any tangible evidence to justify this horrible suspicion?'

'Yes; the surgeon-apothecary and his wife, a Mr and Mrs Williams, who attended Lady Redwood, have suddenly disappeared from Chester, and, from no explainable motive, having left or abandoned a fair business there.'

'That has certainly an ugly look.'

'True; and a few days ago I received information that Williams has been seen in Birmingham. He was well dressed, and not apparently in any business.'

'There certainly appears some ground for suspicion. What plan of operations do you propose?'

'That,' replied Mr Repton, 'I must leave to your more practised sagacity. I can only undertake that no means shall be lacking that may be required.'

'It will be better, perhaps,' I suggested, after an interval of reflection, 'that I should proceed to Birmingham at once. You have of course an accurate description of the persons of Williams and his wife ready?'

'I have; and very accurate pen-and-ink sketches I am told they are. Besides these, I have also here,' continued Mr Repton, taking from his pocket-book a sheet of carefully-folded satin paper, 'a full description of the female baby, drawn up by its mother, under the impression that twins always—I believe they generally do—closely resemble each other. "Light hair, blue eyes, dimpled chin"—and so on. The lady—a very charming person, I assure you, and meek and gentle as a fawn—is chiefly anxious to recover her child. You and I, should our suspicions be confirmed, have other duties to perform.'

This was pretty nearly all that passed, and the next day I was in Birmingham.

The search, as I was compelled to be very cautious in my inquiries, was tedious, but finally successful. Mr and Mrs Williams I discovered living in a pretty house, with neat grounds attached, about two miles out of Birmingham, on the coach road to Wolverhampton. Their assumed name was Burridge, and I ascertained from the servant-girl, who fetched their dinner and supper beer, and occasionally wine and spirits, from a neighbouring tavern, that they had one child, a boy, a few months old, of whom neither father nor mother seemed very fond. By dint of much perseverance, I at length got upon pretty familiar terms with Mr Burridge, *alias* Williams. He spent his evenings regularly in a tavern; but with all the pains-taking, indefatigable

ingenuity I employed, the chief knowledge I acquired, during three weeks of assiduous endeavour, was, that my friend Burridge intended, immediately after a visit which he expected shortly to receive from a rich and influential relative in London, to emigrate to America, at all events to go abroad. This was, however, very significant and precious information; and very rarely, indeed, was he, after I had obtained it, out of my sight or observation. At length perseverance obtained its reward. One morning I discerned my friend, much more sprucely attired than ordinarily, make his way to the railway station, and there question with eager looks every passenger that alighted from the first-class carriages. At last a gentleman, whom I instantly recognised, spite of his shawl and other wrappings, arrived by the express train from London. Williams instantly accosted him, a cab was called, and away they drove. I followed in another, and saw them both alight at a hotel in New Street. I also alighted, and was mentally debating how to proceed, when Williams came out of the tavern, and proceeded in the direction of his home. I followed, overtook him, and soon contrived to ascertain that he and his wife had important business to transact in Birmingham the next morning, which would render it impossible he should meet me, as I proposed, till two or three o'clock in the afternoon at the earliest; and the next morning, my esteemed friend informed me, he would leave the place, probably for ever. An hour after this interesting conversation, I, accompanied by the chief of the Birmingham police, was closeted with the landlord of the hotel in New Street, a highly-respectable person, who promised us every assistance in his power. Sir Charles Malvern had, we found, engaged a private room for the transaction of important business with some persons he expected in the morning, and our plans were soon fully matured and agreed upon.

I slept little that night, and immediately after breakfast hastened with my Birmingham colleague to the hotel. The apartment assigned for Sir Charles Malvern's use had been a bedroom, and a large wardrobe, with a high wing at each end, still remained in it. We tried if it would hold us, and with very little stooping and squeezing, found it would do very well. The landlord soon gave us the signal to be on the alert, and in we jammed ourselves, locking the wing-doors on the inside. A minute or two afterwards, Sir Charles, and Mr and Mrs Williams, entered, and, paper, pens, and ink having been brought, business commenced in right earnest. Their conversation it is needless to detail. It will suffice to observe that it was manifest Sir Charles, by a heavy bribe, had induced the accoucheur and his wife to conceal the birth of the male child, which, as I suspected, was that which Williams and his spouse were bringing up as their own. I must do the fictitious baronet the justice to say that he had from the first the utmost anxiety that no harm should befall the infant. Mr Malvern's nervous dread lest his confederates should be questioned, had induced their hurried departure from Chester, and it now appeared that he had become aware of the suspicions entertained by Mr Repton, and could not rest till the Williamses and the child were safe out of the country. It was now insisted, by the woman more especially, that the agreement for the large annual payment to be made by Sir Charles should be fairly written out and signed in plain 'black and white,' to use Mrs Williams's expression, in order that no future misunderstandings might arise. This Mr Malvern strongly objected to; but finding the woman would accept of no other terms, he sullenly complied, and at the same time reiterated, that if any harm should befall the boy—to whom he intended, he said, to leave a handsome fortune—he would cease, regardless of consequences to himself, to pay the Williamses a single shilling.

A silence of several minutes followed, broken only by the scratching of the pen on the paper. The time to me seemed an age, squeezed, crooked, stifled as I was in

that narrow box, and so I afterwards learned it did to my fellow-sufferer. At length Mr Malvern said, in the same cautious whisper in which they had all hitherto spoken, 'This will do, I think;' and read what he had written. Mr and Mrs Williams signified their approval; and as matters were now fully ripe, I gently turned the key, and very softly pushed open the door. The backs of the amiable trio were towards me, and as my boots were off, and the apartment was thickly carpeted, I approached unperceived, and to the inexpressible horror and astonishment of the parties concerned, whose heads were bent eagerly over the important document, a hand, which belonged to neither of them, was thrust silently but swiftly forward, and grasped the precious instrument. A fierce exclamation from Mr Malvern as he started from his seat, and a convulsive scream from Mrs Williams as she fell back in hers, followed; and to add to the animation of the tableau, my friend in the opposite wing emerged at the same moment from his hidingplace.

Mr Malvern comprehended at a glance the situation of affairs, and made a furious dash at the paper. I was quicker as well as stronger than he, and he failed in his object. Resistance was of course out of the question; and in less than two hours we were speeding on the rail towards London, accompanied by the child, whom we intrusted to Williams's servant-maid.

Mrs Repton was still in town, and Mrs Ashton, Lady Redwood, and her unmarried sister, in their impatience of intelligence, had arrived several days before. I had the pleasure of accompanying Mrs Repton with the child and his temporary nurse to Osborne's Hotel in the Adelphi; and I really at first feared for the excited mother's reason, or that she would do the infant a mischief, so tumultuous, so frenzied, was her rapturous joy at the recovery of her lost treasure. When placed in the cot beside the female infant, the resemblance of the one to the other was certainly almost perfect. I never saw before nor since so complete a likeness. This was enough for the mother; but, fortunately, we had much more satisfactory evidence, legally viewed, to establish the identity of the child in a court of law, should the necessity arise for doing so.

Here, as far as I am concerned, all positive knowledge of this curious piece of family history ends. Of subsequent transactions between the parties I had no personal cognisance. I only know there was a failure of justice, and I can pretty well guess from what motives. The parties I arrested in Birmingham were kept in strict custody for several days; but no inducement, no threats, could induce the institutors of the inquiry to appear against the detected criminals.

Mrs and Miss Ashton, Lady Redwood and her children, left town the next day but one for Redwood Manor; and Mr Repton coolly told the angry superintendent that 'he had no instructions to prosecute.' He, too, was speedily off, and the prisoners were necessarily discharged out of custody.

I saw about three weeks afterwards in a morning paper that Mr Malvern, 'whom the birth of a posthumous heir in a direct line had necessarily deprived of all chance of succession to the Redwood estates, and the baronetcy, which the newspapers had so absurdly conferred on him, was, with his amiable lady and family, about to leave England for Italy, where they intended to remain some time.' The expressed, but uncompleted will of the deceased baronet, Sir Thomas Redwood, had been, it was further stated, carried into effect, and the legacy intended for Mr Malvern paid over to him. The Williamses never, to my knowledge, attained to the dignity of a notice in the newspapers; but I believe they pursued their original intention of passing over to America.

Thus not only 'Offence's gilded hand,' but some of the best feelings of our nature, not unfrequently 'above by Justice,' and place a concealing gloss over deeds which, in other circumstances, would have infallibly consigned the perpetrators to a prison, or perhaps the hulks.

Whether, however, any enactment could effectually grapple with an abuse which springs from motives so natural and amiable, is a question which I must leave to wiser heads than mine to discuss and determine.

SPONGES.

ABOUT three centuries and a-half before the Christian era, the question—Are sponges animal or vegetable? was proposed by Aristotle; who, unable himself to solve the difficulty, was contented—in the true spirit of a lover of nature—with carefully recording the results of his accurate observations, and advancing his opinion rather in the form of an inquiry than of an allegation. Upwards of two thousand years rolled away ere this question was satisfactorily answered. Nay, we believe that the vegetable theory has, even at the present time, its advocates; while some are still disposed to consider that the sponge is at one period of its existence a vegetable, and at another an animal.

To any one who hesitates to acknowledge that the sponge is endowed with animal life—confessedly in its lowest form, yet with a most exquisite adaptation to its destiny—we would offer the spectacle of a living sponge in a portion of its native element. We would let him gaze on the animated fountain, which is perpetually sucking the water into its substance through its countless pores, and, after assimilating such particles of it as are essential to its existence, ceaselessly expelling it, at more distant intervals, through the larger channels which may be observed on its outer surface. We would point out innumerable gemmules of gelatinous matter, which at certain seasons of the year may be seen spouting 'from all parts of the living film which invests the horny skeleton;* until at length, escaping from the nursery in which they grew, they are carried off to the wide sea by means of the force of the currents issuing from the sponge, though not left to perish at the mercy of the waves. For he will find that the young animal or egg is covered with numberless minute hairs or cilia, each one of which is endowed with a distinct and innate power of vibration; so that by means of thousands of almost invisible oars, the young sponge 'shoots like a microscopic meteor through the sea,' until it arrives at some rock or other place properly adapted for its future growth; then it settles calmly and contentedly down, and gradually losing its locomotive power, begins to spread on its base; and builds up, within its living substance, a horny framework, such as we have already seen in its parent.

The above-named currents may be more distinctly seen by powdering the surface of the water with chalk or any similar substance; and Professor Grant mentions, that by placing pieces of cork or dry paper over the apertures, he could see them moving 'by the force of the currents at the distance of ten feet from the table on which the specimen rested.'

Dr Peysonell, who paid great attention to the structure of the sponge, brought proofs of its animal vitality before the Royal Society in the years 1752-57. And Mr Ellis, five years afterwards, by his dissections, set the question quite at rest; though he fell into the error of believing that the frame of the sponge was the outer case of worms or polypes. Later examination, however, has shown that the *frame* or *sponge*, commonly so called, is an *internal* skeleton, while the vital power is simply composed of a slimy film which coats over every fibre,

and which, inert as it appears, possesses the power of secreting the particles essential to its growth.

It has been affirmed that the sponge is observed to contract or shrink when torn from the rocks; but there is satisfactory evidence to prove that neither this nor any degree of laceration has a sensible effect on this nerveless though vital mass.

All sponges, however, have not a horny framework, but some, which are thereby rendered useless in a commercial point of view, are supported by a skeleton composed of siliceous particles imbedded in a tough fibrous material. These particles, or *spicula*, as they are termed, are so uniform in the species to which they severally belong, that, in the words of Professor Grant, if the soft portion be destroyed, and a 'few of them brought from any part of the world on the point of a needle, they would enable the zoologist to identify the species to which they originally belonged.' Professor R. Jones, however, considers that this opinion should be received with considerable limitations.

The last fact, trivial as it appears, assumes immense importance when we learn that to these spicula we must turn for an explanation of the isolated masses of flint which abound in various chalk formations. 'The mere assertion,' says Rhymer Jones, 'that flints were sponges, would no doubt startle the reader who was unacquainted with the history of those fossil relics of a former ocean; and yet a little reflection will satisfy the most sceptical.' For long ages the sponge is imbedded in the chalk, through which water is continually percolating. A well-known law of chemistry explains why similar matter should become aggregated; and thus the siliceous matter of the sponge forms a nucleus for the siliceous matter contained in the water, until at length the entire mass is converted into a solid flint. But we are not left, he adds, to mere conjecture or hypothesis on this point, 'for nothing is more common in chalky districts than to find flints, which, on being broken, still contain portions of the original sponge in an almost unaltered state.'

There is every reason to believe that the sponge-fisheries of the *Ægean* are at present conducted precisely in the same manner as they were in the time of Aristotle. The sponge-divers are mostly inhabitants of the islands which lie off the Carian coast, and of those situated between Rhodes and Calymnos. These men—who form a distinct society, and are governed by peculiar laws, which prohibit their marriage until they shall have attained a prescribed proficiency in their art—go out in little fleets, composed of caiques, each of six or seven tons burthen, and manned by six or eight divers: each man is simply equipped with a netted bag in which to place the sponges, and a hoop by which to suspend it round his neck; and thus furnished, he descends to a depth of from five to twenty, or even occasionally thirty fathoms. The sponges which he collects are first saturated with fresh water, which destroys the vitality, and decomposing the gelatinous matter, turns it black; this matter is stamped out by the feet of the divers, and the sponges are then dried in the sun, and strung in circles, after which they are ready for sale and exportation.

In a good locality an expert diver may bring up fifty oke in a day, and for each oke he obtains about twenty-five drachams. The weight is calculated, says Forbes, when the sponges are dry, and a very large sponge may weigh two okes. The chief sponge-markets are Smyrna, Rhodes, and Napoli.

Blount, who wrote in 1634, affirms that these sponge-

* Professor Rhymer Jones.

divers 'are from infancy bred up on dry biscuits and other extenuating dyet, to make them extreme lean; then taking a sponge wet in oyle, they hold it, part in their mouths, and part without, soe they go under water, where at first they cannot stay long, but after practice, the leanest stay an hour and a-half, even till the oyle of the sponge be corrupted. . . . Thus they gather sponges from more than an hundred fathom deep,' &c. All this is very wonderful, but the narrator stamps the value of his tale by telling us immediately afterwards that 'Samos is the only place in the world on whose rocks the sponges grow.' So that, in the words which he elsewhere makes use of, 'we applaude hys belief, but keep our owne.' We do not, however, mean to assert that there are not sponges of some species (though not the sponge of commerce) which exist at a depth as great as that which he mentions, for Forbes dredged a living specimen of one small kind from 185 fathoms in the Gulf of Macri.

The sponge of commerce (*Spongia officinalis*) was divided by Aristotle into three kinds—namely, the loose and porous, the thick and close, and the fine and compact. These last, which are rare, were called the sponges of Achilles, and were placed by the ancients in the interior of their helmets and boots, as protections from pressure and abrasion.

The same naturalist states that those sponges are best which are found on coasts where the water becomes suddenly deep, and attributes this superiority to the greater equality of temperature obtained in such waters—observations which have been corroborated by Professor E. Forbes.

Fifty-six species of sponges have been enumerated, ten or eleven of which are found in the British isles. A portion of these inhabit fresh water, among which we may mention the river sponge (*S. fluviatilis*), which abounds in the Thames. Among the British sponges, too, is the stinging or crumb-of-bread sponge (*S. urens*), a widely-diffused species, which, when taken out of the sea, is of a bright orange colour, and which will, if rubbed on the hand, raise blisters. This stinging quality is highly increased by drying the sponge—a process which also gives it the colour and appearance of crumbs of bread, whence its popular name.

Sponges, as may be imagined from the mode of their growth, are most sportive in their forms: some are tubular, others mushroom-like, a few almost globular, and still others branched or hand-shaped; in the warmer seas they hang in fantastic and gorgeous fans from the roofs of submarine caverns, or decorate the sides with vases of classic elegance, though of nature's handiwork. Nor are their colours less various: some are of the most brilliant scarlet or the brightest yellow, others green, brown, blackish, or shining white; while Peron mentions one procured by him in the South Sea which was of a beautiful purple, and from which a liquor of the same colour was extracted by the slightest pressure; with this liquor he stained several different substances, and found that the colour was not affected by the action of the air, and that it would bear several washings.

The value of the sponge in surgery is well known; and it is also used medicinally, being for this purpose lightly burned to powder, and given in small doses in scrofulous complaints. It has also been regarded as a specific in leprosy and hydrophobia. It is, however, needless to say that in these last it can have no influence whatever.

There are several representations of sponges given in the balneal feasts depicted on various Etruscan vases; and the sponge has been found in a perfect state in a Roman barrow at Bartlow Hills. It was discovered near the sacrificing utensils. Livy says that the covering of the breast of the Samnite gladiators was sponge.

While the animal matter remains in the sponges of various kinds, they have always a very strong fishy smell, which may perhaps be regarded as an additional proof of the fealty which they owe to the animal kingdom. Yet we must not omit that there are substances

which, though they bear the name of sponges, would rather appear, from their microscope structure, to belong to the vegetable world; we allude to those known as *gelatinous sponges*, which are perfectly different from the sponges properly so called.

A DAY AT CREWE.

'WHAT place is this?' said the worthy old gentleman my travelling-companion on the London and North Western Railway, as he woke up from a comfortable nap when the train slackened speed, and entered a spacious and expensively-decorated station.

'This is Crewe, sir, I believe,' and scarcely had I answered, when there was a general shout of 'Crewe, Crewe!' from an army of porters who came rushing out, and pounced upon the train as if it were their lawful prey. Presently a head peered in at the door, inquiring 'All here for the Liverpool line?' And on my elderly friend saying that he was for Manchester, he was politely but smartly informed that he 'must change carriages here.' So we both got out; and my friend, after some bother about his luggage, and the use of some hasty language, was at last made 'all right' by being put into a carriage bearing an announcement that that was the 'Manchester train.' On another carriage in front was a similar board announcing the 'Liverpool train,' and behind was a third to announce that for Chester. Passengers were running up and down the platform: some looking after luggage, some for the right carriage, and others darting into the handsome refreshment-room. But nobody seemed to think of going away from the station; indeed the only mode of exit and entrance was through a close-shut iron gate, beside which sat a policeman looking with enviable coolness on all the bustle around him. There was a ring of a bell; a banging of doors; a puff of the engine; and off went the train to Liverpool. Another locomotive now appeared moving cautiously down the line, and was speedily attached to the Manchester train, which was soon out of sight. A third came; caught hold of the Chester train, and away it rushed. The passengers who had journeyed so amicably together from London were now thoroughly dispersed, and ere the sun set, some would be crossing the Scotch Border at Carlisle, some embarking at Holyhead for Dublin, and others attending to their business on the Mersey or the Dee, or amid the tall chimneys of Manchester. A luggage train came crawling out from its hiding-place, and finding the coast clear, went thundering past: the porters wiped their foreheads, and went to have a little rest; and I, the solitary passenger for Crewe, was left cooling my heels on the platform.

'Where is Crewe?' I said to the guardian of the iron gate.

'Cross the bridge, go straight on, and turn to the right,' was the concise reply.

So I crossed the bridge, and found myself in a pleasant country road. The flat rich fields of Cheshire extended on the left and to the right; at the distance of about half a mile appeared the square massive tower of a church, surrounded by long ranges of low buildings like workshops, and rows of houses evidently quite new. Some neat cottages lined the sides of the road, and there were two or three inns all bearing marks of youth; while some zealous people had caused a few bills, bearing the words 'Prepare to meet thy God,' printed in conspicuous type, to be affixed to the walls, giving a stranger not a very high idea of the character of the people in the habit of using that road. Turning to the right, I passed a Methodist chapel, bearing the date of its erection, 1848; a new flour-mill driven by

water; a new inn with a brave new sign-board; and crossing the boundary made by the Chester line, I arrived in Crewe.

Not many years ago, there were only two or three houses here, and the land on which the station and the town are built formed part of a good Cheshire farm. The worthy farmer ploughed his fields and reaped his harvest, his dame made good Cheshire cheese; and both lived merrily on, quite unconscious of the change that their farm was about to undergo. The eyes of engineers were on it: it was placed, as an Irishman would say, 'very convenient' for railway purposes; and after a few years had rolled away, it became the great workshop of the Grand Junction Line, and the point where the main line to Birmingham received its tributaries from the north and west. Several thousands of people were brought here; the company laid out streets and built houses; shops were opened; churches and schools erected; a market-place provided; a Mechanics' Institution established; many hotels built, one of which was destined to lodge royalty for a night; and a town was erected with a rapidity unexampled even in America.

The general appearance of Crewe is very pleasing. The streets are wide, and well-paved; the houses are very neat and commodious, usually of two storeys, built of bricks, but the brick concealed by rough-cast plaster, with porches, lattice-windows, and a little piece of garden-ground before the door. The greater part of these houses belong to the company, and are let to the men at rents from 2s. 9d. per week upwards. The accommodation is good, and it would be difficult to find such houses at such low rents even in the suburbs of a large town. Water is plentifully supplied by public pumps, and the town is well lighted with gas. The names of the streets are expressive: some are called after the towns to which their direction points—such as Liverpool, Chester, Sandbach, &c.; others from the works to which they lead—such as Forge Street; and others from well-known but very modern names—such as Prince Albert Street. The placards on the walls, however, seem somewhat out of place in a railway town, as nearly all have relation to sales of cattle, timber, &c. indicating clearly enough that Crewe is but a mechanical settlement in an agricultural district. The market-place is spacious, and roofed over; the church is a handsome edifice of stone; and the Mechanics' Institution a fine building with a large lecture-room (used also as a town-hall), a good library and news-room, and commodious class-rooms. These were all built by the company; and indeed the completeness of everything connected with the town gives evidence of such an amplitude of means possessed by its founders, as seldom, if ever, fall to the lot of private individuals.

The most interesting objects, however, about Crewe are the railway works. These are placed on a large tongue of land near the station, and so adapted, that wagons, and carriages, and engines can easily be run into them from the main line. In these works everything connected with 'the rolling stock' of the company for the northern section of the line (Wolverton being used for the southern) is made and repaired. The number of hands employed at present is about eight hundred; but formerly, when railways were more prosperous than now, it exceeded a thousand. The workmen seem to belong, in tolerably equal proportions, to the four great divisions of the United Kingdom; and the slow, deliberate speech of the Scot, the rich brogue of the Irishman, and the sharp, quick utterance of the Welshman, have lost very little of their purity and richness amid the air of the county palatine of Chester. The greater portion of the work

is carried on in long large sheds, for the most part of one storey, and called the 'fitting,' 'erecting,' and other shops, according to the nature of the work done in them. The artisans may be divided into two great classes—the workers in metal, and those in wood; the former being employed in making locomotives' wheels, axles, springs, &c. and the latter in constructing the carriages. By far the greatest number of hands are employed in the former.

That our hasty inspection may begin at the beginning, let us peep at the foundry. Both brass and iron are cast here, but to-day it is iron. The sandy floor is covered with moulds of all descriptions, and swarthy workmen are preparing them to receive the melted iron. Occasionally you are startled by the shout of 'Mind your eye!' which must be taken in its literal signification, for it comes from a moulder blowing away with a bellows the superfluous grains of fine sand, which, if once in the eye, will give some trouble. The moulds are ready, the furnace is opened, and a stream of bright white metal rolls out into the pots prepared for its reception, and is speedily poured into the moulds. In an adjoining shed are blacksmiths plying forehammers; but their greatest efforts are entirely eclipsed by the mighty steam-hammer that is seen at work in another part of the shed. This hammer is the invention of Mr Nasmyth of the Bridge-water Foundry, near Manchester. It moves up and down in a strong frame, at a speed subject to such nice regulations, that, according to the will of its director, it can gently drive a nail, or crush to splinters a log of wood. When Lord John Russell lately visited Manchester, the delicate touch of this hammer was strikingly displayed before him: an egg was procured, and placed in a wine-glass, and such was the power possessed over this giant, that after a little adjustment, the mighty hammer was brought repeatedly down so as just to chip the egg as gently as by a spoon in the hands of a child, while the glass was not in the slightest degree injured or disturbed. The labour saved by this hammer is immense. One man sits perched up in the frame to direct it, and another stands below to guide the iron on the anvil. The great long bar, white with heat, is pulled out of the furnace, laid on the massive piece of iron under the frame, and with a dull heavy sound down comes the hammer, swiftly or slowly, according to the wishes of the director. From the forge and the foundry the 'rough-hewn' iron-work passes to be planed, and its surface to be made 'true.' The wheel of an engine or a carriage, for example, after being forged by the blacksmith, requires to be most carefully cut round the rim, so that the space between the flange—that is, the projecting inner part of the wheel, and the outer part—may be perfectly conical, in order that the least amount of surface may be exposed to the rail, and consequently the least amount of friction produced. Again, when a cylinder comes from the foundry, the interior must be cut and polished to a perfect circle, otherwise it would be useless. In short, there is no part of a locomotive that does not require to be prepared with the most perfect accuracy to fit some other part; and if this accuracy is not gained, the engine will either not work at all, or work very imperfectly. It must be remembered that it is hard metal, like iron and brass, that has thus to be wrought on—not comparatively soft material, like wood and stone.

But the machinery employed at Crewe seems capable of cutting anything, even though it were a rock of adamant. You pass into a shed full of little machines, standing separate from each other, with all manner of curious wheels and belts—driven by steam

of course, and each with a man stationed by its side, gazing attentively at the little machine, as if he were absorbed in thought; and indeed were it not for an occasional quick movement of his hands, and a rapid change of position, you might almost suppose that he was sleeping on his legs. But go close up, and you notice that the machine is slowly moving backwards and forwards, and still more slowly at the same time in a lateral direction. Some curious piece of mechanism is placed on it, and the movements of the machine cause a sharp steel-cuttor to pass over the iron surface, which cuts it as easily and truly as a joiner planes a piece of fir. The side motion brings all the surface gradually under the instrument, but the machine, clever and powerful though it is, requires to be constantly watched and regulated, and hence the fixed attention of the man in charge. At a large machine you will see those long curious rods called 'eccentrics' undergoing this operation; at another, a cylinder is being planed; and at a third, the rims of wheels are being cut. The filings thus made are preserved, and will be seen in large heaps in a yard, ready to be melted down, and 'used up' again. In some cases both iron and brass filings are produced, which of course are mixed with each other; but in a quiet corner of one of the sheds you will find a boy with a heap of these filings before him, separating the brass from the iron by means of a magnet. Only imagine a boy of fourteen or fifteen doing nothing all day long except raking a magnet through a heap of black and yellow dust, and brushing into a separate heap the iron filings off his magnet! You will also see a series of three iron rollers working on each other, by means of which plate-iron can be twisted into any given form; a mighty 'punch' which will make a hole an inch in diameter through iron an inch in thickness as easily as though it were clay; and a sharp-cutting instrument that shears through sheets of iron as easily as a pair of scissors through a sheet of paper.

Go into another shed, and you will see all these various parts getting their last touches from the hand, and being fitted into each other; and here also you find two or three men engraving, on circular segments of brass, the names the various engines are to be known by. In another shed the engines are being 'erected.' Here you see from twenty to thirty in all stages of progress. Perhaps the framework only has been laid; or the boiler, with its many rows of long circular brass tubes, has just been fastened, and is now receiving its outer clothing of long slips of wood; or the whole is complete, merely wanting to be tried on the many lines of rail in and around the sheds. There are two classes of engines here, whose difference is observable at a glance: some have six wheels, two of which are very large, about six feet in diameter, and the other four much smaller. The two first only are driven by the machinery, the others being merely what are called 'bearing wheels.' With this description of engine more speed than power is obtained, and hence it is used for passenger trains, where a high velocity is required, and where there is usually little weight, comparatively speaking, to draw. The others have only four wheels, not so large as the two just described, but all driven by the machinery. Such engines are more remarkable for power than speed, and accordingly they are used for luggage trains. In another shed, 'The Hospital,' will be found a number of engines labouring under various disorders, sent here to be repaired.

But carriages and wagons are also built here. You enter a shed (of two storeys this time), and find wood

shavings instead of iron filings, and the hissing of a circular-saw instead of the quiet steady scraping of a 'cuttor.' Here all the woodwork of the carriages is executed, and when ready, they are hoisted through a large trap-door in the roof to the second storey, where they are painted and varnished, and, if first-class, 'upholstered.' In a store-room above stairs are piled heaps of cushions ready for the most expensive carriages; at a table is a boy stuffing with horse-hair the leathern belts that hang by the sides of the windows; and elsewhere an artist is painting the arms of the company on the panels of a door. Here and there are boards placed before a carriage, with the intimation 'Wet!' indicating that you must not go too near; and some of the carriages give evidence of having seen service, but are now renewing their youth under the skilful hands of the painter and the upholsterer. When ready to 'go on the line,' they are let down through the trap-door, fixed on their wheels and axles, and sent to relieve others that require repair.

Six o'clock strikes, and work ceases. In walking back leisurely to the station, I saw many of the workmen digging in their little gardens, 'bringing themselves,' as Emerson phrases it, 'into primitive relations with the soil and nature;' others were reading the papers of the day at the Mechanics' Institution; others strolling among the green fields round the town; and others walking to a class-room, to hear a teetotal lecture; while some were proceeding to recreations of a very different kind. I was admitted through the iron gate by the same policeman; the 'down' express train arrived, and it conveyed me in an hour and a-half to Liverpool, a distance of about forty-five miles, stopping only once at the well-known town of Warrington.

THE ISLAND OF GOTHLAND AS A FIELD OF EMIGRATION.

IN our number for the 9th of March a brief account of Gothland was given, with the view of turning attention to it as a field of emigration. It was stated to be an island of about eighty miles in length, situated in the Baltic, in the latitude of Aberdeenshire; composed of one mass of limestone, and favoured with a climate mild enough to ripen grapes in the open air in summer, while in winter there were not usually above ten nights too severe to allow of the cattle and horses being left out. It was spoken of as well qualified to raise wheat for home consumption or exportation to England, but in agricultural respects a hundred and fifty years behind Scotland, the people being even ignorant of the use of the lime which forms the basis of their soil.

In consequence of our notice of the island, many farmers wrote to us from different parts of the country, making particular inquiries which we were unable to answer. By way of gratifying the desire of information as far as possible, we inserted on the cover of the Journal for May a copy of the prospectus of a company which speculates in the buying of land in Gothland, for the purpose of selling it again, and which we understood to be anxious to see a few British farmers of capital and skill settled upon their lands. We are now able to present another document upon the subject—namely, a report drawn up by an East Lothian farmer of assured experience and sagacity, who was induced to visit Gothland in the beginning of May, in order to judge of the lands with a view to settling. This gentleman is Mr James Watterstone, late of Balgone Barns, now residing at Cairndinnis, by Prestonkirk. It will be observed that, though he views Gothland in a less flattering light than some other persons whose opinions we quoted, he nevertheless thinks favourably of it as a field of British enterprise and capital.

'What first strikes one in travelling through Gothland is the peculiar form of the general surface. Fashioned

somewhat like a saucer, with high edges towards the sea, it has great central hollows forming natural basins for the retention of the water, for which there are few natural outlets towards the sea. The consequence of neglect and ignorance has been, that large tracts in the middle of the island are little better than marshes for a great part of the year, and of little value to the inhabitants, the grasses which they produce being of the very coarsest kind, and scarcely fit for the food of cattle. The arable land of the country is also undrained, and very ill cultivated, being cropped from year to year until completely exhausted. The cultivators of the soil are peasant proprietors, usually of holdings from twenty to fifty acres of arable ground, with one or two hundred acres of meadow and forest-land; the arable grounds, however, much mixed, as in the system of *run-rig* and *run-dale* in Scotland. Each proprietor seems satisfied with throwing his land in small portions into *lazy beds*, so as to allow the water to collect into the intermediate hollows, and thence run off or evaporate as it may. The crop, judging from what I saw of the stubble, is of the scantiest description. No care is taken in the preparation of manure; its use seems not to be understood. Neither is any provision made by a turnip crop for the sheep and cattle. Accordingly, when I was there, the winter being just at an end, the poor animals appeared to have literally no food assigned to them, and were reduced to mere skin and bone. At the same time, from the remains of a turnip-field which I saw upon the newly-reclaimed marsh-land, I am persuaded that the island must be capable of raising this crop in great abundance. How the Gothland sheep live through the winter, and survive after getting full feeding in summer, is what I can hardly understand. In Scotland, with such treatment, not one sheep in a hundred would survive.

The lands of the company consist of large marshes, which they are draining by means of canals in a very judicious manner. The soil is principally of a light peaty nature; not loam, as stated by another observer, but still evidently very capable of cultivation when the drainage is completed. Round the borders of the morasses the soil does approach the nature of a light loam, lying mostly on a clayey or marly subsoil varying from one to three feet in depth, and which can easily be thrown up and mixed with the surface, so as to form a very valuable soil for all purposes. In the centre of the marshes, again, the peat varies in depth from five to six, seven, and eight feet in depth, and will of course be more difficult to render valuable; but it appeared to me that in a few years it could be made to produce most excellent grass either for hay or pasture.

All over the island, lime is to be had for the quarrying; and even under the marshes it is abundant, but of course more difficult to be got at. It is everywhere of the very finest quality, and can be burned for a very small sum, and is easily quarried without gunpowder. I saw at one place a large bed of clay, admirably adapted for the making of tiles and bricks.

The company, in order to facilitate settlements, are buying farms all round the marshes, with houses, &c. already upon them, which they are willing to sell on moderate terms to persons disposed to take marsh-land along with them in proportion to their size. Every farm contains, besides a portion of old cultivated land, a quantity of meadow and forest-land sufficient to furnish every description of wood for building and fuel for centuries to come. They are, besides, erecting buildings on different parts of the property, and preparing wood to be ready for the immigrants who may be induced to settle on their lands.

From what I saw, it is evident that the great object of the company is to improve the agriculture of the country; and they seem inclined to give every encouragement to skilful and steady men from Britain, who will set about their business in a judicious manner. To men of capital, it appears to me a most favourable field for exertion and enterprise, and to hold out the

almost certainty of success. At first, from the impoverished state of the old lands, and over-productiveness of the new, little profit can be expected; but a very few years will suffice to put all that right. Everything, with the exception of British manufactures, is very cheap; so much so, that L.50 will go farther than three times that sum in this country. All over the island the farm-houses are excellent, and far beyond what they are in this country for the same extent of land, while the people are kind-hearted in the extreme, and exceedingly honest; so much so, that house-doors are very seldom locked at night. Labour, also, is very cheap; but the people are slow in comparison with our work-people; and every implement is of the most primitive description, and entirely unfit for the purpose to which it is applied.*

We learn from Mr Watterstone that, though he saw the country at the most unfavourable season, and was disappointed on finding it fall a little below the descriptions, he nevertheless thought so well of it, as to resolve on making it his future home. He designs to settle on one of the company's farms in August next. We apprehend that there are difficulties to be overcome, such as the sluggishness of the people in adopting improved habits, and the obstacles which the complicated state of the lands present to drainage; but where is there a livelihood to be obtained without difficulties? In the fine plains of Haddington and Norfolk, the tenant farmer encounters troubles of only a different kind. One great recommendation, were the case ours, would lie in the amiable, upright, inoffensive character of the Swedish people. Mr Watterstone everywhere found the peasant proprietor of perhaps thirty or forty acres living in a good house, with civilised usages. Of the honesty of the people he himself gives sufficient proof in what he says of their indifference to locks for their house-doors. They are generally well affected to the idea of having British settlers amongst them. In short, it appears that a man of moderate means and skill may carve a comfortable existence for himself out of this naturally rich and favoured island with considerably more ease, and perhaps, on the whole, more comfort, than in this country, where the interests of landlords so considerably overshadow those of the immediate cultivators.*

SOCIAL LIFE IN FRANCE.

THE BAL—PARIS IN THE SEASON—THE COUNTRY HOUSE—HOUSEHOLD ECONOMY—CHARACTERS—CONCLUSION.

When I returned to Tourloville, I found a relation of Caroline's and her little daughter on a visit at the Prefecture. Madame la Marquise de Flottancourt was a fine handsome woman, although rather *passée* perhaps, who moved with a grace, talked with a talent, and dressed with an elegance, I never found equalled. She could say something agreeable upon every subject, and to every person; all were charmed, and none more so than I. Hermoine, her daughter, a girl of twelve, was a most finished specimen of a French child. Such amiable, modest manners! such intelligence! such pleasing sentiments! such fond affection constantly exhibited towards her mother, who returned it with a warmth of expression that made the most affectionate of English mammas I could bring to my remembrance appear cold in comparison! Mother and child seemed to take especially to me, and invited me so cordially to join them in Paris in time for their grand *bal*, and afterwards accompany them to Flottancourt to spend the winter, that I at last suffered myself to be persuaded; and accordingly, about two months after the time we met at Tourloville, I found myself at Madame de Flottancourt's splendid

* The proper persons to address respecting the lands of the company are Mr Lilljévalch, merchant, Stockholm, and Mr Enequist, H. B. M. consul at Wisby, Gothland. We understand that the company do not intend to appoint any agent in this country, having no wish to press their lands on the attention of the English public, but rather being disposed to trust to the effect of a few settlements being formed with satisfactory results.

apartment in the Champs-Élysées. The richness of the furniture quite dazzled and bewildered me: the hangings were satin, the curtains velvet, and the net which festooned under them, to soften, as it were, the brilliant colours, was covered with broad beautiful lace. Then the elegant tables and stands, the ornaments upon them; the little statuettes were all perfect of their kind; and indeed everything seemed to me a refinement upon what I had hitherto considered luxury.

At the much-talked-of *bal* I could think of nothing but fairyland, into which all the rooms appeared transformed. Flowers in pots, in bouquets, in their native soil, abounded everywhere; exotics made the air faint with perfume; the music was perfection; and all was one flood of light reflected from walls panelled with mirrors. The dresses, whether magnificent or simple, were alike remarkable for that taste which seems confined to Paris; for although individuals are met with elsewhere who would call forth expressions of approval and admiration even there, the *tout-ensemble* of the company is seldom well-dressed; and in England, above all, the desire of being thought *original* leads many people to make themselves as ridiculous in their attire as in their general conduct. At the moment, the *very* moment I am writing this, a lady is passing; every one turns, and stares, and laughs, and asks 'Who is she? what is she?' She is a well-born, well-educated, most benevolent, excellent person, neat and clean in her attire, and pleasing in her countenance; but she chooses to dress 'sensibly,' as she terms it. Long petticoats are the fashion as well as full ones, but hers are short, and seem to cling to her, as she can walk with more freedom, she says, and without gathering mud; she wears a poke bonnet when no one else does so, because it keeps off the sun; long waists don't become her, so she wears short. All this may be very '*sensible*,' but the result is, that it makes her unlike every one else, and causes her to become an object of attention and mockery, when, by making a little concession to the prevailing fashion of the day, she would pass unobserved, instead of being laughed at as half mad, which I am not sensible enough to see the great advantage of. *Mais revenons à nos moutons*, or, if you will, to our wolves in sheep's clothing, the guests at Madame de Flottancourt's ball, where all was smooth in dress and behaviour: every one looked well, everything went right. The ice-creams, sorbets, and refreshments, were exquisite; tasting like what one fancies of the nectar and ambrosia of the gods. Almost everybody famed in literature, arts, or arms, was there; historic personages floated past, dispensing with their smiles a flattery so refined and veiled, that it sounded like truth. The fair mistress of the revels went from one guest to another, charming each. 'Look, Miss Loden,' cried Herminie; 'look at my dear, my beautiful mamma! Who is there here more lovely than herself! more graceful! more loveable? How inimitably she dresses! I am proud of my mother! Don't you think I well may be so?' said this affectionate child, looking at Madame de Flottancourt with glistening eyes. I replied as she expected, for I really thought all she said was but the truth.

We had afterwards one or two dinners, which were commanded with the same apparent disregard of expense, and conducted with the same order. The dessert, which alone appeared upon the table, was of the most expensive description, and beautifully arranged. An immense vase filled with flowers occupied the centre of the table; on each side were large oblong silver-gilt plateaux covered with *figurines* and Sèvres ornaments. The different dishes and *baissans* were handed round by the servants; but beside la marquise herself were some bottles of very rare wine, one of which was placed in a machine that, upon her turning round a handle somewhat after the fashion of a barrel-organ, inclined the bottle without shaking it, and filled the glasses without trouble. The conversation all the while was never interrupted; but I felt too unaccustomed to the style of it to take any part, listening, as I usually did,

unless when the party happened to be large enough to allow me to occupy the attention of my immediate neighbour without making a break in the general 'flow of soul.'

But the time of our departure for the country drew near. 'I have been very fortunate,' observed Madame de Flottancourt, 'in finding tenants for my apartment this season in your compatriots the Sedleightons. Next winter I shall, however, occupy it myself; and having given so many parties just now, I may then remain quite idle for a time, and only amuse myself, and go to those given by my friends. But at present we must think of Flottancourt, for which place I propose leaving Paris and its delights upon Tuesday week.'

Madame de Bois Favort having arrived by this time in the capital, I gladly seized such a good opportunity of paying her a little visit, and leaving the De Flottancourts to make their arrangements without the *gêne* of a quasi stranger. Madame de Bois Favort's apartment in the Rue Pepinière (they had let their hotel, which is still occupied by the Comte Ferrarini) was small, but convenient. There were many curiosities and many comforts, but nothing approaching the splendour which dazzled you at the Marquise de Flottancourt's. A clever *femme de chambre*, a general servant, and a man, formed her whole establishment, with a *femme de journée*, who came twice a week; but it was impossible to have nicer little dinners or better attendance. All new books and new music were to be met with in her *salon*, where a small number of the most agreeable people in Paris assembled every Monday. The style of conversation interested me more, and dazzled me less, than that of the literati Madame de Flottancourt drew round her, and I retired to rest less fatigued than after the glare and excitement of our parties in the Champs-Élysées. I was now struck with what I confess I never saw before: namely, the wide difference between these two ladies, and that difference *not* in favour of Madame de Flottancourt. A sort of actress-like play of feature and turn of expression—a something got up and unreal, that I could not explain even to myself—was brought before my mind when I contrasted the quiet composed manner of Madame de Bois Favort, enlivened at times by a refined, gentle vivacity, which pleased the more from its rarity. I never heard her say, as I have Madame de Flottancourt and fifty other Frenchwomen—'*Là simplicité est charmante! et il n'y a rien de si difficile.*' Her '*simplicité*' cost her no trouble, for it came naturally. Her dress, too, most perfectly fashionable, and fitted for her station, had a subdued elegance about it which was not so apparent in that of the marquise, who, although never fine, was always and *evidently* very expensively attired, and as near the extreme of the reigning mode as good taste would allow her to approach. The mind of Madame de Bois Favort was, as I before remarked, highly cultivated; but she had none of that brilliancy of wit, that flattering deference of tone, those rapid changes of countenance, that *striking* grace of motion, which captivated you at first, and fatigued you afterwards in her rival. There was also another point of view in which she showed to advantage that I had not before thought of; for as a Protestant, and attending to my own religion, I did not pay much attention to the theology of my Roman Catholic friends; but now, when I saw Madame de Favort in Paris, as in the country, doing good and showing kindness in the same unostentatious way, going quietly dressed to a quiet church at a quiet hour daily, always speaking of every attribute of religion with profound respect, and thought of Madame de Flottancourt, bustling in brocade on Sundays to that gorgeous pagan temple (at present appropriated to Christian worship) the Madeleine, peeping over her superb velvet and gold prayer-book at every one round her, and confining her criticisms to the *dress* of the audience, never even touching on the sermon she had yawned through any more than if she had never heard it, I felt that, although professing the same religion in

name, their ideas upon the subject were as wide apart as if each held a different faith. M. de Bois Favort was an intelligent, agreeable man; and to his politeness I am indebted for seeing the most interesting monuments of Paris, which la marquise deemed quite secondary to its amusements, and never had time to throw away upon.

Tuesday at last arrived, and we set out for Flottancourt in the *coupe* of the diligence, Madame de Flottancourt's carriage, like her servants, having been hired for the season; and I very soon had occasion to remark that the fascination of look and manner which had so charmed me, diminished in proportion to the distance that separated us from Paris. The refreshments ordered during the journey, too, made me regret the ample and excellent table I had lately enjoyed in the Rue Pepinière; and Hermoine loudly expressed her dissatisfaction, for which she received the first sharp reprimand I had heard addressed to her, and returned the first scowling glance I had observed on her countenance. At Barr the carriage came to meet us; and such a rickety, miserable, old jingling vehicle I never had before beheld—horses and harness were in strict keeping with the equipage—and the coachman looked as though he had just stepped out of the frontispiece to 'Sterne's Sentimental Journey.' I suppose my countenance expressed the surprise I felt; for Madame de Flottancourt immediately said, 'A la compagne nous ne sommes pas à Paris.' She had made the same original and profound observation before upon one or two occasions, especially when Hermoine complained of the fare; but I could not see how such a remark applied to a gentleman's establishment in the country. However, off we set, and had ample time to admire the beautiful country through which the wretched roads carried us, when all at once we came in sight of an imposing-looking building surrounded by trees.

'Oh what a fine old place! What is the name of it?'

'That,' answered Madame de Flottancourt, with a return of the manner which at Paris was so fascinating—'that is Flottancourt!'

It was indeed a noble structure; but as we approached, the marks of decay and neglect became evident. Imperfect fences, ill-made roads, broken gates, trees lying on their broadsides, no young plantations coming on, ornaments defaced, steps and railing in want of repair. It looked like a stately ruin, but not at all as the inhabited house of a rich widow ought to look. Again Madame read my countenance, for she said, 'It would take such an immense sum to restore the place, that I have not courage to begin.'

I thought that one season at Paris given up would do a great deal towards it, but did not venture to say so, feeling it would displease. The inside corresponded with the dilapidated appearance without; immense rooms barely furnished; huge fireplaces, which, unless filled with trunks of trees—which I never saw but on company days—made one shiver to look at; old servants, looking respectfully confused and somewhat cross, and very few of these even seemed to greet us. Happily it was a fine day, or I think I should have wept with despair. The smallest room in the house was given to me at my own request; but the cold I endured was something which even now I look back to with a feeling of discomfort, and the reflection invariably cools me upon a hot day in July. I made it as comfortable as I could with sheep-skins; and by putting sand-bags at the door, and stuffing up mouse-holes with putty and rags, contrived to reduce the draughts; for in this room alone did I feel anything like calmness or comfort. After a while, I perceived that the inviting me to spend the winter was a 'clever dodge' of Madame de Flottancourt's to get her daughter instructed in English, and kept up in music for nothing. She made much of me, however, before company, although, like the rest of her unhappy household, I sometimes experienced the unpleasant effects of an uncontrolled temper. Being *à la compagne* was an excuse for having everything uncomfortable it seemed. There were cows, but we had no cream, no

fresh butter, because it was winter. You could not take advantage of a 'fair blink' to get a little walk on a wet winter's day; because made walks there were none, and the wretched roads were ankle-deep. In summer, no doubt, it might be charming enough to wander about the woods and lanes; but although the Marquise de Flottancourt knew full well last winter that the Sedleightons were to take her apartment at Paris from the 10th of December, yet such was her carelessness, stinginess, and want of common management, that nothing more was provided against the winter's residence than she was contented to do without during the summer. Her object was to spend in vanity at Paris all that she denied Flottancourt. But not only did I find out that I had been deceived in Madame de Flottancourt, Hermoine also soon showed that she, like her mother, was but a Parisian actress. Here she made no affectionate speeches—gave no fond glances. She turned her mother into ridicule the moment her back was turned, and often made grimaces at her as she left the room. Sometimes, but not often, we had society from the neighbouring town, when Madame performed, for that night only, the rôle of her popular character, and was charming in all eyes but mine, who now saw under the surface. Once or twice we went to dine or make a morning visit to some of the gentry of the canton, which last, going and coming, generally took up the best part of a day, on account of the roads; but although at none of these châteaux and *maisons de compagne* was I witness of the discomfort, parsimony, and wretchedness I saw at Flottancourt, still it was very evident that being *à la compagne* in France was not like being in the country in England: a want of consistency, a want of keeping, a want of comfort, I perceived everywhere; no place was in order, or in a state of progressive improvement; the general habits were slovenly, and the duties of a country family, as we consider them, seemed unknown. For my own part, I have enjoyed more comfort, cultivation, elegance, and liberality combined, at the habitation of a squire of from L.800 to L.1000 a year, than I ever saw in France at the finest château I visited, Bois Favort always excepted. There things were, although quite as un-English, perfectly well-ordered, easy, and gentleman-like; and in Madame de Bois Favort all the brilliancy of the Frenchwoman was united to the sober sense and unpretending excellence of her British sister.

There was one magnificent château we went to where the family were unfortunately from home on a visit. The rooms, staircase, galleries, were very fine, and there was no want of splendid *pieces* of furniture; but I observed no carpets on the stairs, no stove in the galleries, no library, nor half the comfort one sees in even the most uncomfortable show-house in England; and the family being only gone for a week, it may be supposed to have borne the same aspect as when they were there. The grounds were extensive, and beautiful: long avenues of elms and limes diverging like rays from a centre, clipt close as a hedge half-way up, and then allowed to grow as nature bade them; well-kept grass plots, flowers in profusion, all neat and in order, and gravel walks well rolled. In the kitchen there were 300 copper pans glittering like gold, stove-tables in every direction, but no bright white cheerful fireplace. The servants were kept warm by their work or *chaufferettes*, of which there stood a range; but I shall ever regret not being able to accept the invitation so politely sent, as I might then have been better able to describe accurately what at present I can only glance at and suppose.

The breakfast hour in most families was twelve; the dinner six in the country. The former may be considered as our luncheon; and you break your fast in your bedroom with a large cup of *café au lait* and a roll at an early hour. Latterly, I have seen tea taken at night, but it is not very common; coffee, without cream, immediately after dinner being in general thought sufficient. The French manage usually, I think, with fewer servants than we do, and to the public eye every-

thing looks as nice as with us; but as we live for ourselves and our families, and they for the world at large, there is a want both of comfort and cleanliness behind the scenes. Upon the whole, my experience has taught me to wish to see nothing French imitated at home except the tasteful simplicity, freshness, and fashion of their dress; and the amiability of their charming manners, where no guest is permitted to feel himself neglected, and every intention of amusing the company is acknowledged gratefully, whether it is successful or not. At one time of the year the word 'confiture' is in every *ménagère's* mouth; although red-currant jelly, plain and *framboisé*, is the only domestic confiture I have seen made, except cherries or apricot marmalade occasionally, by *very* aspiring dames. The common people also make what they call *résiné* of grapes, apples, and pears, boiled without sugar, till reduced to a pulp. All grocers keep vases with currant-jelly, *résiné*, pomatum, and lip-salve, and you can go with your pot and buy for a penny of any; but the various jams or jellies common to the simplest household in Scotland they know nothing of. I have also often wondered at finding gooseberries in their garden, for they make no use of them in pies, puddings, or drinks; and people of condition invariably expressed surprise at seeing me eat them: to be sure they are usually abominably bad. The butter is excellent, but they rarely eat it, as we do, on bread. Twice a year they prepare it for cookery in a manner I wonder we do not adopt, for it keeps admirably, and answers well. It is put into a large *marmite*, and allowed to remain upon the fire, but never stirred or touched until thoroughly melted; it is then skimmed, and poured off, while liquid, into bottles and small pots, and the *grounds* either given to the poor, or allowed to stand till cold by economists, and then scraped and used for frying immediately. The other, covered from the air, keeps perfectly for several months, without salt or further care. Many good French scholars lose many things by not knowing how to ask for them. If you want a rice pudding, order a *gâteau de riz*; if a custard pudding, ask for *une crème*. Never ask for soup, unless you like the vapid stuff which goes by that name: beg them to serve you up *potage*. If you desire cream in the country, you are surprised to receive it sour: had you demanded *fleurettes*, you would have had what would improve your tea; and so on. Crawfish are given for crabs on the coast, because, remembering our vocabulary, learnt with tears, we desire to have an *écrevisse*; whereas the local name in most of these places is *tourteau*.

Although a good French cook is certainly superior to every other, the generality of those who offer themselves to the English *pour faire la cuisine*, for from L.12 to L.16, are execrable. They ring the changes of a few greasy dishes over and over again, have no variety, cannot roast or boil, and you must therefore live on stews. The soup of common cooks is dreadful: neither fish nor vegetables can they dress *au naturel*; the bad colour and taste must be disguised under a sauce; and yet you hear Britons lauding French cookery to the skies merely because it is foreign; while the French themselves, who are so much better able to judge, imagine we are content with these messes because they resemble English cookery. Except at a first-rate restaurant, the common run of English never taste good cookery; and no one lives worse than the English abroad who go to economise. There is never any place to keep meat, which you must eat either tainted or tough; and unless it is stewed and seasoned, it is commonly very bad. A fine name works wonders. 'Delicious!' I heard an affected young Sawney cry. 'Madame, pray taste this tête de veau en tortue.' 'Hoot, laddie!' answered his aunt, after tasting, 'it's just cauf's-head haush!'

There were many singular characters at Tourloville. One in particular was a great amusement to me. Madame Flaudrin was the reverse of a religious character, and never went to church, although she did allow that the Catholic religion was *bon pour le peuple*. She

had a good fortune and a good digestion; she loved the world, and the world had hitherto gone well with her; but at last she became ill, seriously ill, and the prospect of death gave her some uneasiness, for, as she sagaciously observed, it could not be *exactly proved* that there was not another world. Having heard that reading the Bible was proper in such circumstances, she resolved to try what effect it would have, and taking from a cabinet her dust-covered Bible, requested me to read her a portion.

'What part would you like to hear?' asked I, seeing her turning over the leaves between Romans and the Revelations.

'Ah, lisez moi cette jolie histoire de Joseph—ce pauvre Joseph!—cette vilaine Madame Putiphar!'

I have seen this lady, who, when she went into company, dressed better than any one there, walking about and giving orders to workmen in an attire made of blanket flannel—jacket, trousers, and stockings, *all in one!*—somewhat resembling a little boy's skeleton clothes, but not so nice; her feet thrust into sabots, and sometimes not another article on; generally, however, she added a shawl, short, worn, and dingy. Her great friend Madame la Crosse de St Jerome always brought to my mind Madame du Deffand, and at the age of ninety was still a charming companion. I think I see her now in that dull, old-fashioned, unfurnished room, looking into the street through the tall windows, sitting on one side of the fire, which she never saw, as she occupied a recess, and the high chimney came forward. She, like many old Frenchwomen (and at that time many middle-aged ones too), always wore a bonnet; and there she sat, from January to December, from morning till night, doing nothing but talk, talk, talk. She told me she had been pronounced consumptive, and given up by the doctors at eighteen, and told to take leave of the world; but she went on her old way, laughed at the doctors, and never swallowed a drug except Anderson's Pills: of these she took one every Saturday for fifty years, and attributed to *les pilules Ecossaises* the good health she had enjoyed for that period. But these discursive sketches may as well end here as anywhere else. I have noted down from my thickly-coming recollections a few particulars taken here and there, both of good and bad; some of them, no doubt—and more especially, I hope, of the latter—in this age of progress and intermixture, already obsolete. Be it so. I have at least given future visitors a point of departure, and they will be able to calculate all the better the real ratio of improvement.

A TRIP TO LEBANON.

A FRENCH traveller who sojourned for a time in Syria during a recent voyage to the East, made various excursions into the mountain districts of Lebanon. The narrative of his journey and adventures, as published in a foreign periodical, presents a few points of general interest, which we transfer to our pages. While staying in the suburbs of Beyrout, he set out one day to walk into the town in the afternoon hours usually devoted by the population to the *siesta*; a period in which, according to the popular saying, 'nobody is abroad in the sunshine but dogs and Franks.' 'I had never before,' he observes, 'entered Beyrout at this unseasonable hour; and I fancied myself the man in the "Arabian Nights" walking into the city where all the inhabitants had been changed into stone. Every one was in a profound sleep: the sentries under the gate, the ass-drivers in the great square, waiting for the ladies, who were probably asleep also in the bath. The dealers in dates and water-melons slept at their stalls by the side of the fountain, the *cafedji* (coffee-seller) snored in his shop with all his customers, the *hamal* (porter) lay with his head resting on his burthen, the camel-driver by the side of his kneeling animal, and some tall fellows of Albanians keeping guard before the pacha's seraglio—all were buried in tranquil sleep, leaving the city to take care of itself.

'It was on such an occasion, and during a similar period of somnolence, that three hundred Druses once made themselves masters of Damascus. They entered the city in small parties with the crowds of country people who, in the early part of the day, throng the squares and bazaars, and at the hour of the siesta made a feint of sleeping as the others. Their groups, however, were skilfully distributed, and at a given moment, took possession of the principal posts, while the main body pillaged and set fire to the rich bazaars. The inhabitants, waking up in sudden surprise, imagined themselves overpowered by an entire army, and barricaded themselves in their houses, while the troops did the same in the barracks. The Druses took advantage of the panic, and at the end of an hour, mounting their horses laden with booty, made off to their unattackable retreats in the mountain.'

Approaching the quarter of the town near the sea, the traveller finds some signs of life, and orders dinner at a hotel, where a notice posted on one of the doors intimates to visitors, 'Here the charge is sixty piastres a day.' Several English travellers are present, from one of whom he learns many particulars respecting the hill country and the inhabitants. On paying for his dinner, he is surprised to find the demand not more than ten piastres—about two shillings. The landlord, an Italian, leads him aside, and invites him to take up his quarters in the hotel. The Frenchman, in reply, points to the announcement respecting the sixty piastres a day, to which Signor Battista responded, 'Body o' me, that's for the English, who have plenty of money, and are all heretics; but for the French and other Romans it is only twenty piastres!'

After this specimen of inn-keeping morality, we have a description of the life and movement in the bazaar. 'Never,' says the traveller, 'have I seen more beautiful children than those playing about in the splendid central alley. Young girls, graceful and joyous, thronged round the elegant marble fountains, ornamented in the Mosque style, and departed one by one, bearing away large antique vases filled with water on their heads. Red hair is frequently seen, of a more decided colour than is commonly met with in Europe, partaking more of purple or crimson. This colour is so much regarded as a beauty in Syria, that numbers of the women dye their hair, if brown or black, with henna, which in other countries is used only to redden the sole of the foot, the nails, and palm of the hands.'

'Besides these, at the places where the alleys intersect each other, were the retailers of ices and sherbet, manufacturing their beverage, as it was wanted, from snow brought from the summit of the Sannin. A brilliant *café*, frequented chiefly by soldiers, also supplied iced and perfumed drinks at the central point of the bazaar. I remained there some time absorbed in contemplating the movements of the active crowd, which combined in a small space all the varied costumes of the mountain. There was something singular to watch the motion of the gilded horns (*tantours*), a foot in height, during the excitement of buying and selling, worn on the head by the Druse or Maronite women. A long veil, which they raise at pleasure, covers their face; and the position of the glittering ornament gives them an appearance resembling the fabulous unicorn which serves as a supporter in the escutcheon of England. Their external costume is uniformly black or white.'

On another occasion the author is unexpectedly favoured with the sight of a Turkish funeral. The deceased, however, was not an ordinary mortal, but one of those unfortunate beings called lunatics by Europeans, but by the Turks *santons*, or saints. This one had lived for many years entirely naked in a grotto under a garden wall, where he was visited by pilgrims from all quarters. A large concourse of people attended the funeral, rejoicing that the defunct had attained his state of beatitude. But great consternation was excited when the dervises who bore the corpse, on attempting to enter the low dome-shaped tomb, seemed to be repelled and pushed down by some unknown power. Again and again did they try to gain an entrance; the mourners chanted louder and

louder; but all to no purpose: the dead man would not go quietly into his tomb! A consultation was then held with the old men of the party, who recommended a rapid gyration, by way of bewildering the corpse, as affording a chance of success. 'This counsel was generally approved; the chanting was renewed with increased vigour; and the dervises, taking the coffin by the two ends, whirled it round and round for several minutes, and then with a sudden movement darted into the tomb. The people waited the result of this daring manoeuvre in great trepidation. For a time it was feared that the dervises would fall victims to their audacity, and be buried by the falling in of the walls; but in a few minutes they came out triumphant, announcing that, after a few difficulties, the *santon* remained perfectly quiet, on which the crowd broke out in acclamations of joy, and dispersed, some to the coffee-house, others to their homes.'

After making himself acquainted with the most striking phenomena of city life and manners, the traveller accepted the invitation of the emir of a mountain district to accompany him to the seat of his government. On making a preliminary stage in the cool of the evening up the first ascent, a view of the city is obtained at a period when the inhabitants were all walking either on their house-tops or terraces. The serenity of the Syrian night, which is described as a *bluish kind of day*, is eminently favourable to this recreative exercise. After a few days' travelling through dark pine-woods, fertile valleys, or across arid and sandy plains, the party arrives at the prince's residence. Here, pursues the narrator, 'at the dinner-hour—that is, towards noon—I was requested to ascend to a high gallery, open towards the court: one end was fitted up as an alcove with divans and cushions: two females, showily dressed, were seated on one of the divans, their legs crossed in the Turkish manner; and a little girl, who was seated near them, came as soon as I entered, and, according to custom, kissed my hand. I bowed, and took my place with the prince at an inlaid table, which bore a large tray covered with dishes of various sorts. The little girl brought me a long silk napkin worked with silver at each end. The ladies, however, continued sitting on the divan as motionless as images during the repast; but when we had done, we took our places in front of them, and the elder of the two ordered in *narghiles*, or pipes.'

'Above the jacket, made to fit tight round the waist, and the *cheytian* (trousers), these ladies wore robes of rayed silk, a heavy golden girdle, and ornaments of diamonds and rubies. The horn, which the mistress of the house balanced on her forehead with the movements of a swan, was of chased silver-gilt, set off with rows of turquoises, while the long tresses of her hair, interwoven with strings of *sequins*, flowed over her shoulders in the fashion of the Levant. The feet of these ladies, drawn up on the divan, were innocent of stockings—a custom general in this country, and one which gives an attraction to beauty very remote from our ideas. Women who seldom walk, and bathe themselves several times daily in perfumed water, and whose toes are never compressed by their shoes, have feet as beautiful as their hands. The red dye of henna upon the nails, and the massive rings, rich as bracelets, complete the charm offered by portions of the limbs, sacrificed too often in Europe to the glory of shoemakers.'

The ancient sport of falconry is still kept up in the East. The day after the traveller's arrival, he joins a party who ride along the banks of a river till they come to the marshes, where they fly their falcons at two herons, which take to flight at the reports of muskets fired to disturb them. One of the two birds beat off the falcon, and escaped into a neighbouring wood, while the other mounted in a direct line into the air. 'Then,' says the narrator, 'began the real interest of the chase. It was in vain that the fugitive heron lost himself in space, where our eyes could not follow him; the falcons saw him for us, and not being able to follow to so great a height, waited for his descent. It was an animated sight to see these three watchful birds float on the air with outstretched wings, whose whiteness was often lost in the azure of the sky. At the end of ten minutes, the heron,

either fatigued, or unable to breathe the rarefied atmosphere of the upper regions, reappeared at a short distance from the falcons, which instantly darted upon him. It was the struggle of a moment: as the combatants neared the earth, we were able to hear their cries, and to discern the furious *mêlée* of wings, necks, and claws. Suddenly the four birds fell as one mass to the ground, and the scouts were some minutes before they could find them in the grass. At last they picked up the heron, still alive, and cut its throat, to prevent further suffering. The falcons were rewarded with a piece of flesh cut from the breast, and the rest of the poor heron was brought back as a trophy of success. The prince talked to me of hawking expeditions which he had made into the valley of Becqua, where the falcon is trained to attack gazelles. But there is something cruel in this mode of hunting; for the falcons are taught to settle on the heads of the animals, and peck out their eyes. I had not the least desire to assist in so melancholy an amusement.

'The same evening a splendid banquet was given, to which many of the neighbours had been invited. A number of little tables *à la Turque* were arranged in the courtyard, to suit the rank of the guests. The heron, triumphal victim of our expedition, was made to stand, by means of wires, with outstretched neck and wings, in the centre of the table, where I was invited to take my seat near some Lazarite monks from the neighbouring convent of Antoura who had come to the feast. A party of singers and musicians were placed on the steps leading up to the house, and the lower end of the court was filled with people sitting at little tables in groups of five or six. The dishes passed from the upper to the lower tables, and at last circulated among a troop of mountaineers seated on the ground, who finished their contents. Old drinking-glasses of Bohemian manufacture were placed on our tables, but the greater part of the guests drank from cups which passed from hand to hand. The principal dish consisted of roasted mutton with pyramids of pilau dyed yellow with cinnamon and saffron; then came fricassées, boiled fish, vegetables mixed with chopped meat, water-melons, bananas, and other fruits of the country. At the end of the repast toasts were drunk to the sound of instruments and the acclamations of the assembly. One-half of a party seated at a table would rise and drink to the other half; and in this way the festivities were prolonged far into the night.'

After a few more days passed under the emir's hospitable roof, the traveller joined a party which set out to attack a Maronite village about a day's march distant. The same kind of petty but demoralising warfare seems to be going on in the mountain districts of Lebanon as formerly prevailed on the Scottish Border or in the Highlands. On this occasion, however, no lives were lost, the rage of the invading party being expended on the cactus hedges and olive and mulberry-trees belonging to the enemy. The traveller was disappointed in his expectation of witnessing a specimen of mountain fighting, and after saying farewell to the prince, returned with his guide, Moussa, to Beyrout.

THE OLD MAID.

WHEN I first knew her, she was between thirty and forty. Her features were plain, yet she was far from ugly: there was a nameless charm in their expression which made her almost beautiful. Hers was a face that you would have stood to look at, as at a picture. I recollect seeing her sometimes at our house, a long time ago, when I was a very little fellow. There was something very quiet and gentle about her, and that very calmness seemed to repel all intrusion. I used to wish to love her, but dared not. Sometimes I would steal up to her noiselessly as she sat at work, and she would stoop down and kiss my forehead, and then push me gently away; and sometimes I thought I felt a tear fall on my cheek, but it may have been only fancy.

Years passed on, but to my youthful fancy they brought no change in her: she was the same gentle being as before. She rented a pretty little cottage, but

could not be said to live there, for she was always wandering from place to place among her acquaintance, doing them little services. Did Mrs Tomkins want assistance in making a dress?—the old maid did the neatest needlework imaginable. Was Mrs Jenks busy preparing for her Christmas party?—the first preliminary was to write to the old maid to come and make some of the mince-pies that were so much praised last year. And when any individual in her circle of acquaintance was laid on a bed of sickness, who so ready to smooth with gentle hand the pillow of pain, and calm the unquiet, wandering mind, as the old maid? Who, like her, would tend with unwearied care the restless hours of sickness, and raise the sinking heart of the sufferer by sitting near him through the livelong night with no other companion than a book and her own quiet thoughts?

She seemed strangely alone in the world; for excepting a widowed sister, she had no relatives. Sometimes I wondered that she did not get married, but how the thought came into my head I have no idea. For somehow, I cannot tell why, the notion seemed quite absurd in connection with her. What could we have done without her? She get married! It was out of the question.

She lived on a small annuity in her little cottage near the suburbs of the town. There was a little patch of fruit garden, about three yards square, with a little round bed in the middle, and a few stunted evergreens round the side. She had one maid-servant, a little demure creature, as prim and quiet as herself. The little front parlour was rather scantily furnished, and cold-looking, but very neat. You always saw some elegant bit of industry in progress on the table, but there was nothing of the kind to be seen round the room. Some of her numerous friends were constantly asking her to make them one of those nice so-and-sos, like the one she did for Mrs Briggs; and she was always happy to oblige them. There was no arm-chair or sofa in the room: on the square pianoforte (an old one of Broadwood's) you might sometimes observe a plain black bonnet and a pair of cotton gloves. There was a scent-bottle on the mantel-piece, but it had been a long while empty. There were a few books on a little shelf hung against the wall; a little poetry and some good solid prose: strange companions stood side by side, for it contained an odd jumble of things new and old. You might have seen 'Rasselas' and Hervey's 'Meditations,' Moore's 'Zeluco' and Young's 'Night-Thoughts,' Scott's 'Rokeby' and 'Guy Mannering,' Walton's 'Angler' and 'Paradise Lost.' A Shakspeare there was of course—an old edition in many volumes; and, what used to please me most, a large old Bible with pictures in it.

Years passed by. We had lost sight of the old maid for several weeks, when one day she appeared at our house, paler than ever, and in deep mourning, leading in her hand a boy of about eight years old. Her sister was dead, and had left this boy to the care of his only relative in the world. I was grown a big fellow now; and when the old maid at intervals came to see us, I used to patronise her little nephew, and would initiate him into the science of 'peg in the ring,' or endeavour to make him an adept at 'fives.'

The old maid seldom visited now, for she devoted all her time to the education of her nephew; and with such a course of training he grew up, gentle and quiet like herself. As years passed away, we could see little change in her tranquil course of life; but there was much to be noticed in her protégé. He had early given token of intellectual power of a high order, and she procured the best masters for him; and when she could no longer superintend his studies, she would sit by him, and encourage him by gentle words and kisses.

In course of time he went to Cambridge. We knew not by what means his aunt was thus enabled to prepare him for fame and honour, till we noticed that, though the cottage looked as neat as before, the prim maid-servant was no longer to be seen.

Some years afterwards, the old maid called at our house to bid us good-by. Her nephew, after becoming an M. A., had been received into the church; and while continuing his studies, had been anxiously looking for a curacy, but without success. He had been offered a situation to travel as tutor with a nobleman's son; but the poor old woman could not bear to part with him. At last, through some titled friend, he had procured a curacy of a hundred a year in a country village a long way off, and she was going to him there. She looked rather thinner and older than of yore; but she was very cheerful and merry at the thought that her Harry was at last provided for, however poorly.

Time passed, and the nephew, from the curacy, succeeded to the living. He took a few private pupils, and his income was increased. After a little time he married; but the old maid could not love his wife, though there was no outward objection to her. The bride was cheerful, good-tempered, and pretty; but the old maid looked for something inside, and could not find it: there was no depth in her eyes—they shone like painted glass.

The old maid left the home where she had been happy for so many years, and returned to her cottage. I daresay the minister and his wife were not sorry to get rid of her, for she was rather a check upon them; moreover, she had become, they said, sour and 'odd'; and there was often no pleasing her, do what they would. But she was growing old, and the weight of years will bend down the strongest mind, and wither the outer covering of the heart, though not the heart itself.

She returned to her cottage, and became acquainted with a few old people like herself, who could feel for her loneliness, and at their homes she used to spend her evenings. But she was no longer the gentle, suffering woman of thirty years before: she had become fretful and peevish; and now her frequent amusement was a rubber of whist, at which game she began to be an adept. You seldom saw her face look pleasant, as of old, unless when seated at the table with a partner to her satisfaction. She now wore several rings on her fingers, and though her dress was of the same quiet kind as ever, it was ornamented with a brooch and chains which did not use to be there. She would talk to you of things you had forgotten long ago: of her visit to Abbotsford, with an anecdote of Sir Walter which she had heard from the old housekeeper. She would criticise Edmund Kean, and inquire if you knew John Kemble. She used to praise the latter, and say she never cared to go to the play unless to see his 'Hamlet,' it was so quiet, so melancholy, and solemn. She would wish to see it again, she said, but she had no one to take her. I would then tell her that that celebrated man had died years ago, and she would only change the subject, and ask me what I thought of Scott's last novel.

Sometimes she would show you a miniature representing a man of noble features in a military dress. Then she would tell you how brave he was, but he was ambitious, which made her very unhappy; and how he went abroad, and his name had been returned among the 'seriously wounded' in the skirmish at Quatre Bras. For many long years she had expected he would return, for his death had not been reported, and she could not but believe that he was still alive. If you asked her who he was, she would turn away, and give you no answer.

One day the Rev. Mr. — received a note from a physician informing him that his aunt was dying, and was anxious to see him once more. On the evening of the following day he set out, and reached the cottage a few hours after she was dead. However, he was in time to read her burial service.

And I believe he placed the stone upon her grave, which sets forth that she was the daughter of a certain person, and that she died on such a day, in such a year. And then follows, if I recollect rightly, a verse from

Holy Writ. This was the conclusion. Even her nephew, wedded by the ties of wife and children to the living, would forget his benefactress soon. She passed away as if she had never been; and no one now, but some solitary dreamer like myself, recalls even a flitting memory of the Old Maid.

TO MY DREAM-CHILD.

'All is nothing—and less than nothing! The children of Alice call Bartrum father.'—*Charles Lamb's 'Dream-Children.'*

LITTLE one! I lie in the dark
With thy sweet lips pressed to mine;
My hot, restless pulses meeting
Thy still heart's slow, quiet beating,
In a calm divine.

On my breast thy bright hair floats;
Well its memoried hue I know!
And thine eyes if thou wert raising,
They would answer to my gazing
Looks of long ago.

Fairy hand, that on my cheek
Falls with touch as dove's wing soft,
I can feel its curves, resembling
One that, like a young bird trembling,
Lay in mine so oft.

Thou wilt spring up at my feet,
Flower-like—beautiful and mild;
Gossips, too, on me bestowing
Flattery sweet, will say, 'Thou'rt growing
Like thy father, child.'

No! I would not have my face
Imaged, blessed one! in thine;
I, who crushed out all my being
In one love, and poured—clear-seeing—
My heart's blood like wine.

I have given thee a name,
What name—none shall ever know;
When I say it, there comes thronging
A whole lifetime's aim and longing,
And a life-time's woe.

Ah, that word!—I wake—I wake—
And the light breaks cold and bare;
Bright one—never born, yet dying
To my love—without replying,
Dream-child, melt to air!

Eyes, no wife shall ever kiss;
Arms, no child shall ever pile;
Lift I up to Heaven, beseeching
Him who sent this bitter teaching;
Be it as His will!

Not as man sees, seeth God;
Not as man loves, loveth He;
When the dregs-stained lips are failing,
When the tear-spent eyes are veiling,
Dawns eternity.

THE LOCUST BIRD.

It is most gratifying to state that the locust bird has made its appearance in the adjoining district of Fort Beaufort in great numbers. Opportunity was afforded us, about nine days since, of witnessing several flights of this bird, and it was peculiarly interesting, in connection with their great services to man, to observe their rapid but graceful motions while in pursuit of their prey. Their numbers, like the locusts, are incredible, presenting at a distance the appearance of a dark cloud floating in graceful evolutions in the clear atmosphere. Their pursuit of the locust is incessant, soaring occasionally into regions so high, as to appear to the spectator a mere speck, and then descending with the velocity of a swallow, which they greatly resemble when on the wing, to the surface of the earth. The largest flight of locusts is destroyed by them in the course of a day or two, and sometimes in a few hours, and thus merciful provision is made by an ever-watchful Providence against a scourge which, but for Omnipotent Power, would speedily lay bare and render useless some of the fairest regions of the earth.—*Graham's Town Journal.*

SATURDAY, JUNE 29, 1850.

PRICE 1½d.

OUR OLD DRESSMAKER.

'THIS will never do, my dear,' said my aunt ruefully, as she pondered over a long account just come in, being the sum expended in the making of my first 'evening dress.' 'Sixteen shillings! in addition to the materials! These London dressmakers are ruinous. We must find some one to work in the house, as did Lydia Jones.' And my poor aunt, newly imported from the country, sighed while she fastened my pretty dress—called frock now no more; for it marked my passing into the charmed regions of young ladyhood. I loved it, the pretty pale silk, of simple yet graceful fashion, which did duty as a 'best dress' for more time than richer maidens would care to confess. The poor old thing! I found a fragment of it the other day, and sighed, remembering the scenes where it had been, and the girlish bosom which beneath its folds had learned to throb with deeper pulses than those of pleasure at a new silk dress.

My aunt's lamentations that night brought forth their fruits. 'Letty,' said she on our next linen-drapery investment, 'I have found a dressmaker, to work as Lydia did, for eighteenpence a day. You can help her, my dear, as you used to help Lydia. Women can never learn too much regarding the use of their fingers.'

I acquiesced, for I had a fancy, indeed quite a genius, that way, I believe; only I always wished to make the dresses on artistic rather than fashionable principles, and I began to fear the London workwoman would not coincide with my vagaries so readily as quiet Lydia in the country. So I rather dreaded the advent of the new dressmaker.

'Who is she, and when does she come, aunt?'

'Her name is Miss Hilton, and she comes to-morrow. Now, my dear, go to your practising.'

I did go—but, with the curiosity of fifteen, I did not cease to speculate on the young workwoman. In fact I confess to having bestirred my lazy self half an hour earlier on the following morning, in honour of her coming, which, in our quiet life, was quite an event.

It was, I remember, one of the wettest of all wet September days. Still, at half-past eight A.M., there faithfully appeared 'our dressmaker.' Little cause had I to be alarmed at *her*—a poor, pale thing, who, when she had taken off her damp shawl—I recollect inwardly wondering at her folly in putting on such a thin one—sat down very quiet and demure, and ate her breakfast in silent respect.

I was a shy girl, a very shy girl; but I believe my good feeling so far conquered my timidity as to make me inquire if Miss Hilton would not take off her wet shoes, and have a pair of slippers; and then meeting my aunt's eye, I subsided in fearful blushes, lest I had taken too much notice of 'the dressmaker.'

We got on very well together, Miss Hilton and I, when the work began. She took the patterns skilfully, and yielded to all my little peculiarities about grace and beauty in costume. Moreover, she did not treat me as a child, but as a 'young lady;' and when, with great dignity, I sat down to assist her in making the skirt of my aunt's new dress, Miss Hilton still kept a respectful silence, which soothed my pride, and won my favour amazingly.

Now I was a most romantic young damsel, and knew nothing of the world except from books, of which I had read an infinity, good, bad, and indifferent. So, regarding my companion—with her small neat figure, her face of that sort not properly termed good-looking, but yet decidedly *looking good*—I began to take a liking for her very soon, and ventured a few questions.

'Had she come far that wet morning?'

'Only about two miles.'

'She must have risen early then?'

'Yes, about five: she had had to finish a dress before she came.'

What a life! To rise at five, work till eight, walk two miles through those muddy lanes (we lived a short distance out of London), and then begin and work again! I said nothing, but I thought much; and I remember the next time Miss Hilton stood cutting out, I had the sense to place a chair for her. This she acknowledged with a faint blush, which made me think of the sweetest ideal of all young dressmakers—Miss Mitford's 'Olive Hathaway.'

My dressmaker was no ideal—I do not mean to set her up as one. She was merely a gentle, modest, quiet young woman, who worked slowly, though carefully, and who for the first day did not seem to have an idea beyond her needle and thread. The next, I found she had.

I, always an odd sort of girl, happened just then to be wild about a new hobby—phrenology. Now Miss Hilton had a remarkably-shaped forehead, and I never rested until I brought the plaster mapped-out head, and compared her bumps therewith; upon which she smiled, and becoming conversational, seemed to wish to learn something about the new science. So I, forgetting my shyness, and my pride of caste, began seriously to inform the mind of our new dressmaker.

I found she *had* a mind, and some graceful taste withal, whereupon I valorously undertook my 'mission.' I indulged her with my juvenile notions on art and literature, and while she developed the skill of my fingers, I tried to expand her dormant intellect. Poor, simple soul! I do believe she enjoyed it all sitting working at my open window, with the vine-leaves peeping in, I dilating the while upon innumerable subjects, which doubtless had never before entered her mind. Among these were the country and its beauties. One day some

fortunate chance had brought me a nosegay of fox-gloves, and showing them to her, I found, to my intense pity, that my young Londoner did not even know their name!

'What! Had she never seen wild flowers? Had she never been in the country?'

'Oh yes, she had once lived for six months in a guard-ship off Woolwich, where she had seen the country on the river banks, and her little sisters had sometimes brought home handfuls of daisies from the parks! But for herself, she had worked ever since she could remember; and except the six months in the ship, had never lived anywhere but at Chelsea!'

To me, how dreary seemed such an existence! To stitch—stitch—stitch one's days away; never to read a book, or walk in a country field, or even to know the name of a wild flower! Perhaps, in my deep pity, I overlooked the fact, that one rarely misses pleasures never known; yet still my feelings were strongly excited for poor Mary Hilton. I did not like her the less for learning that her Christian name was that sweet one—Mary. And when all the work was done, and I began to wear the new dresses we had together fabricated, I often thought of the pale, quiet, little thing, and hoped that wherever she was 'working out,' it was with no harder task-mistresses than my good aunt and I.

When we sent for Miss Hilton again it was a sudden call—to make mourning. The lost relative was one too aged and too distant to occasion me much grief, yet I remember the very fact of our sitting sewing black dresses caused our talk to be rather grave; and then the dressmaker told me of a brother—the only one she ever had—who died of consumption; and how she used to sit by him at night, and go out working in the day—towards the last hurrying home so fast lest 'anything might have happened' (that painful gloss we shrinkingly cast over the cold word death) while she was away. How, at the end, it was as she feared. She was working with a lady, who kept her late to finish—just to sew on a few trimmings and hooks and eyes—a mere half-hour's work. But she was that one half hour too late, and never again saw her living brother!

'It was a chance—a mere chance,' she said; 'the lady was not to blame.' And sighing, though without tears—she seemed too quiet for that—the little dressmaker went on with her work again.

We could not finish the mourning in time: it was my fault, I fear, inasmuch as I had invented a fantastic trimming which cost a world of trouble to make, to which poor Miss Hilton submitted with infinite patience. She only asked if she might bring her sister to help her, whereto my aunt graciously assented. But I—always shy of strangers—found great discomfort in the plan. Moreover, the sister's name was Caroline, and I had a girlish prejudice—I have it still—against all Carolines. Miss Caroline Hilton was the exact image of my abhorrence—pretty, vain, talkative—the very type of the worst class of London dressmakers. My aristocratic pride rebelled against her forwardness: I ceased to work in the room; in fact, from the moment she came, I—to travestie irreverently a line from the grandest modern poet—

'Shrank into myself, and was missing ever after.'

Only I made my aunt promise that never again should Miss Caroline darken our doors.

It seems to me, jotting down this sketch at random, that there are in it many lines and touches which belong not alone to the portrait of our dressmaker. Well, let it be so.

When Mary Hilton came to us again it was in the winter-time. She looked, as ever, pale, and was still prone to silence; but there was a greater air of content about her, which spoke of improved fortunes. And in making our engagements with her, it came out accidentally that her hands were full of profitable occupation. Among her new 'ladies,' I remember, were the juvenile scions of a ducal household, wherein she used to be employed for

weeks together. Now I was a simpleton in those days: I had a romantic reverence for rank—not vulgar curiosity, but an ideal homage—and greatly did I delight in hearing about the little noblewomen; and Mary Hilton seemed to like telling, not pompously, but simply, how Lady Alice was a beautiful child, and Lady Mary was rather cross, and Baby Lady Blanche was the sweetest little fairy in the world, and would come and talk and play with 'the dressmaker' as much as ever she was allowed. Many visions I mentally had of the lordly household, where the chief filial duty was the privilege of entering carefully dressed with the dessert, and where mamma was not mamma at all, but 'the duchess.' How time passes! The other day I saw in the paper the marriage of the 'beautiful and accomplished Lady Blanche H——.' I thought of 'Baby Lady Blanche,' then of poor Mary Hilton, and sighed.

Our dressmaker worked blithely through the short winter-day, and even when night closed, she seemed in no hurry to go home. About nine o'clock there came up to our workroom a message that some one had called to fetch Miss Hilton: 'A young man,' explained the domestic, hesitating, I suppose, whether she should or should not say 'gentleman.'

'I am really quite glad. I did not like your walking through those dark lanes alone,' said I with infinite relief; and then added in extreme simplicity, 'I thought you had no brother now?'

'It is—not my brother,' murmured our dressmaker, blushing, but faintly, for even the quick blood of youth seemed to creep languidly beneath her constant pallor. I was a child—a very child then. I don't believe I had ever thought of love or lovers—that is, in real life; but some instinct made me cease to question the young woman. Likewise, instead of descending with her, I stayed up stairs; so that she met her friend alone. But I remember opening the blind a little way, and watching two dark figures passing down the snowy lane—watching them, and thinking strange thoughts. It seemed as if a new page were half-opening in life's book.

It had opened; and with eyes light-blinded I had begun to read—for myself, and not for another—before I again saw my little dressmaker.

My aunt and I had changed our abode to the very heart of London, and Mary Hilton had to come to us through four miles of weary streets. I think she would scarcely have done it for gain: it must have been from positive regard for her old customers. She looked much as usual—a little paler perhaps; and she had a slight cough, which I was sorry to hear had lasted some time. But she worked just as well, and just as patiently; and when at nine o'clock came the knock at the door, her smile, though half-concealed, was quite pleasant to see.

I am getting an old woman now, but to this day I incline to love two people who love one another. I do not mind what their rank in life may be: true love is the same in all ranks; and I honestly believe there was true love between my little dressmaker and her Daniel Ray. A respectable, worthy young man was Daniel, as my good and prudent aunt took care to discover. I, in my simple, girlish way, discovered much more. Little did Mary Hilton talk about it; but from her disjointed words I learned that theirs was a long engagement—that Daniel was assistant in a china-shop; that they were waiting, perhaps might have to wait for years, until he could afford to rent a little shop of his own, where she would carry on the dressmaking in the floor above. Meanwhile she at least was quite content; for he came to tea to her father's every Sunday, and in the week-day, wherever she worked, he always fetched her—saw her safe home to Chelsea, and walked back to the City again. Honest, unselfish, faithful lover! Poor Mary Hilton! She, in her humble way, had great happiness—the only happiness which fills a woman's heart.

But one night she had to go home without Daniel Ray. He was in the Potteries, she said, on business; and the poor little thing seemed grieved and trembling when she started to walk home alone, and at night.

She scarce minded the bright, cheerful streets, she said; but she did not like to pass through the lonely squares. The next evening she begged permission to leave by daylight; and at last, with much hesitation, confessed that she had been spoken to by some rude man, and had hurried on past her strength, until, reaching home, she fainted. And then, in my inmost heart, I drew a parallel between myself—a young lady, tenderly guarded, never suffered to cross the threshold alone—and this young person, exposed, without consideration, to any annoyance or danger. The lesson was not lost upon me. All my life, as far as my power went, I have taken care that, whatever her station, a woman should be treated as a woman.

For a week Mary Hilton worked for us, coming and returning each night, walking the whole way, I believe—though I never thought about it then, I have since; and the heedlessness of girlhood has risen up before me as the veriest hard-heartedness. My aunt, too—but she had many things to occupy her mind, and to her Mary Hilton was only 'the dressmaker.' Doubtless we did but as others did, and the young woman expected no more. For I remember, the last night she looked so pale and wearied, that my aunt gave her at supper a glass of wine, and putting into her hand two shillings, instead of the usual eighteenpence, told her to have an omnibus ride home. And then Mary Hilton blushed and resisted, but finally took the sixpence with a look of such thankfulness! Poor thing!

The next time we wrote for our dressmaker, there came, not gentle little Mary Hilton, but the obnoxious Caroline. Her sister was in ill health, she said, and had been obliged to give up working out, but would make the dress at home, if we liked. It was settled so, only we premised that Mary must come to us to try it on. She came one evening, accompanied by Daniel Ray. For this she faintly apologised, saying 'he never would let her go out alone now.' Whereat my aunt looked pleased; and when she quitted the room, I heard her go into the hall and speak in her own kindly tones to honest Daniel.

Mary Hilton tried on my dress, but seemed scarce able to stand the while. I remembered this afterwards, not then, for I was thinking of my pretty dress, and whether I would look well in it. At that time how I longed to make myself fair! Poor fool! but it was not for vanity, God knows! However, it will not do to ponder on these things now. I did not forget to put my usual question to Mary—how she was prospering in the world; and whether there was any near chance of the little china-shop, with 'Mrs Ray, Dressmaker,' on the first floor? She smiled hopefully, and said something about 'the spring,' and 'when her health was better;' and in a very shy and timid way she hinted that, if we wanted bonnets or millinery, there was a sister of Daniel's lately established in the next street—a sister always dependent on him till now. Faithfully I promised to give our small custom to Miss Ray; and so, looking quite happy, our little dressmaker descended. I am glad I saw that happy look—I am glad I noticed the perfect content with which the little delicate thing walked away slowly, leaning on her faithful Daniel. Otherwise, in my after pity, I might have thought life's burthen heavy, and its fates unequal. But it is not so.

Soon after, my aunt wanted a winter bonnet, and I proposed to visit Miss Ray. 'Certainly, my dear Letty,' was the contented acquiescence. So we went, and found there a sharp-featured, Frenchified young milliner, the very antipodes of Daniel. During the trying on I inquired after Miss Hilton.

'Very ill, miss—confined to the house—consumption, I think. But wouldn't a paler blue suit your complexion best?'

I laid down my ribbons, startled and distressed.

'Poor Miss Hilton!' said my compassionate aunt. 'I thought she would die of consumption—so many dressmakers do. But how does your brother bear it?'

'As well as he can, ma'am. It was a foolish thing

from the beginning,' added the milliner sharply, her natural manner getting the better of her politeness. 'The Hiltons are all consumptive, and Daniel knew it. But I beg your pardon, ma'am; perhaps you will try on this shape?'

I turned away, feeling very sorrowful. My first intent was to ask my aunt to let me go and see poor Mary Hilton; but when one is young, one sometimes feels ashamed even of a good impulse which might be termed romantic; and I was so mocked for my romance already. I planned various schemes to fulfil and yet disguise my purpose; but somehow they all faded away. And then my own life was so tremblingly full, so rich in youth's dreams, that out of it the remembrance of the poor dressmaker soon melted like a cloud.

Late in April—I *know* it was April—I wanted a new bonnet. It must be a pretty and becoming one—I was wildly anxious about that—one that hid the faults of my poor face, and set off to advantage any single beauty that Heaven had given it. At Miss Ray's I tried on bonnet after bonnet, examined myself eagerly yet tremblingly in all, tried to gain a clear, unbiassed notion of what my poor self was like, and at each look felt my cheek changing and my heart throbbing.

'Letty, my dear!—'

My aunt coming forward, after a confabulation with Miss Ray, roused me from what might have seemed a reverie of girlish vanity; and was—no matter what it was.

'Letty, you will be sorry to hear that poor Mary Hilton—'

Mary Hilton! For weeks she had not crossed my thought: nay, not even now, so full was I of anxiety about my new bonnet.

'Poor Mary Hilton died last week!'

It came upon me like a shock—a pang—a sense of the end that must come to life, and all life's dreams. I—walking in the dazzling light of mine—felt a coldness creep over me; a sting, too, of self-reproach and shame.

I laid down the pretty bonnet, and thought, almost with tears, of the poor little dressmaker, who would never work for me any more—of her hard toils ended, her humble love-dream closed, her life's brief story told, and all passed into silence!

Then I thought of the poor faithful lover: I could not ask after him—but my aunt did.

'Daniel bears it pretty well,' answered the sister, looking grave, and shedding one little tear. It must be a hard woman indeed who does not show some feeling when brought into immediate contact with death. 'He was with her to the last; she died holding his hand.'

'Poor thing—poor thing!' murmured my tender-hearted aunt.

'Yes, she was a good little creature, was Mary Hilton; but as for the rest of the family, they were nothing over-good—not fit for my brother Daniel,' said the young woman rather proudly. 'Perhaps all was for the best. He will get over it in time.'

So doubtless he did: possibly the humble little creature who loved him, and died thus loving, might even have wished it so. Every unselfish woman would. But I never heard what became of Daniel Ray, for my aunt and I soon after vanished from London; and when we returned, our milliner had vanished too. Mary Hilton, and all memories belonging to her, were thus swept utterly away into the chambers of the past—my girlish past.

But the other day, finding an old, many-years' old dress, one whose veriest fragments I could kiss and weep over, I remembered, among other things, who it was that had then fashioned it; and looking on the careful stitches, thought of the poor fingers, now only dust. And a great sense came over me of the nothingness of all things, and of our need to do good in the daytime, because of the quick-coming night 'wherein no man can work.'

My lady readers—my 'lilies that neither toil nor spin'—show womanly tenderness to those who do toil

and spin for your pleasure or profit; and if you are disposed to be harsh, thoughtless, or exacting, think of this simple sketch from actual life of Our Old Dress-maker.

PHILOSOPHY OF JOURNALISM.

THE history of Journalism is still unwritten; but the materials accumulate fast, and by and by we shall have a historian rising from the crowd of annalists and essayists, to weave together their loose facts and speculations, and while ascertaining the origin, and tracing the progress, of this department of literature, to show its connection with, and influence upon, the destinies of the people. In the meantime, we have now at least a Herodotus of Journalism, who gives the results of observation and inquiry in a picturesque and animated manner, and who, though no more a historian, in the higher sense of the word, than the illustrious Halicarnassian, is, like him, an industrious collector and an agreeable narrator. The pages we refer to contain the material history of journalism in England, which is high praise, both as regards utility and originality: the coming man will interweave with this its moral history, and deserve a higher name.*

Journalism is public opinion embodied in the periodical press; and if this definition—condensed and corrected from Canning—be correct, it is obvious that its history must be something more than a mere history of newspapers. The 'moral of the history of the press' is not, as our author strangely concludes, 'that the state is powerless in checking it in a journal-reading country.' This is but a minor conclusion involved in a major of far more importance. The former may be established by the annalist; while the latter, as we shall presently attempt to show, must be deduced by the historian.

Before the dawn of journalism in this country, towards the close of the reign of James I., news was a luxury which could only be enjoyed by the wealthy. Country gentlemen employed persons in London to send them from time to time 'News-letters,' and this kind of reporting had grown into a profession. The bright idea at length came into the head of one of the news-writers, whose name was Nathaniel Butter, to produce his intelligence at regular intervals; and instead of writing it for the benefit of an individual, to *print* it, and depend upon the public for remuneration. From a reporter, therefore, he became an editor; he turned his letter-room into a publishing office; and on the 23d May 1622 the first number of the first English journal, the 'Weekly Newes,' made its appearance. Butter was laughed at, but he was not melted from his purpose: he and his establishment were ridiculed on the stage by Ben Jonson, and but little 'patronised,' as the phrase is, by the public; but there was vitality in the notion, and the first journal jogged on, however meanly; and its editor, timid, subservient, and poor as he was, contrived to live by the business for eighteen years.

The infancy of journalism was passed in leading-strings; but during the civil wars, our author tells us, the aid of the press was invoked by both sides, and its trammels, therefore, fell to the ground. The press, in reality, grew with the growth, and strengthened with the strength, of public opinion. Men did not select it as an instrument of warfare: they merely gave forth in its pages the feelings that had reached a state of ebullition; and it acquired importance as it became more truly and more widely an expositor of the sentiments of the people. Such expositions were crushed for a time by Charles II.; but the Revolution laid a solid foundation for the liberty of the press. Government, no longer driven to attempt the suppression of a power it feared, appealed in its own turn to public opinion. Government papers

were instituted to do battle with opposition papers; and thus the system, carried afterwards to so prodigious a height, was fairly commenced.

Before this time the finest spirits of the age had seen the necessity for a free press; and Milton more especially regarded any interference with it as a kind of sacrilege:—'Books,' said he, 'are not absolutely dead things, but do contain a progeny of life in them to be as active as that soul was whose progeny they are; nay, they do preserve, as in a phial, the purest efficacy and extraction of that living intellect that bred them. I know they are as lively, and as vigorously productive, as those fabulous dragon's teeth; and being sown up and down, may chance to spring up armed men. And yet, on the other hand, unless wariness be used, as good almost kill a man as kill a good book: who kills a man, kills a reasonable creature—God's image; but he who destroys a good book, kills reason itself, kills the image of God, as it were, in the eye. Many a man lives a burthen to the earth; but a good book is the precious life-blood of a master-spirit, embalmed and treasured up on purpose to a life beyond life.' The 'armed men' springing a little later from these dragon's teeth were political libels, declared by the author of 'Cato's Letters' to be merely an evil arising out of a much greater good. 'And as to those,' says he, 'who are for locking up the press because it produces monsters, they ought to consider that so do the sun in the Nile; and that it is something better for the world to bear some particular inconveniences arising from general blessings, than to be wholly deprived of fire and water.'

During the reign of Queen Anne, the first daily newspaper, the 'Daily Courant,' appeared, and journalism, hitherto pretty nearly confined to news, began to assume the mixed character it has to-day, and to spread abroad the speculations of the writers upon the intelligence they communicated. Before this an attempt was made at journals consisting wholly of speculation; but these were merely the news-pamphlets of an earlier period, reproduced in the periodical form, and they led, as a matter of course, to the development of the regular newspaper. This was the epoch of Defoe, who was sentenced to the pillory for a political libel, and who brought out his Review while still in jail. The 'Daily Courant' was published in 1709, at which period there were eighteen other London papers, although the written news-letters still maintained so close a rivalry with the printed sheets, that we find one of the latter reminding the public that print cost less than manuscript. This period was likewise distinguished by the appearance of literary journals—the 'Tatler,' 'Spectator,' 'Guardian,' &c. when the genius of Addison, Steele, Swift, Bolingbroke, and others, conferred an air of elegance and distinction upon the public press.

Addison's remarks upon the appetite for news in his day, and the way in which it was satisfied, would apply in their general features to our own:—'There is no humour in my countrymen,' he says, 'which I am more inclined to wonder at than their general thirst after news. There are about half-a-dozen ingenious men who live very plentifully upon this curiosity of their fellow-subjects. They all of them receive the same advices from abroad, and very often in the same words; but their way of cooking it is so very different, that there is no citizen, who has an eye to the public good, that can leave the coffee-house with peace of mind before he has given every one of them a reading. These several dishes of news are so very agreeable to the palate of my countrymen, that they are not only pleased with them when they are served up hot, but when they are again set cold before them by those penetrating politicians who oblige the public with their reflections and observations upon every piece of intelligence that is sent us from abroad. The text is given us by one set of writers, and the comment by another. But notwithstanding we have the same tale told us in so many different papers, and, if occasion requires, in so many articles of the same paper; notwithstanding,

* The Fourth Estate: Contributions towards a History of Newspapers, and of the Liberty of the Press. By F. Knight Hunt. 2 vols. London: Bogue. 1850.

in a scarcity of foreign posts, we hear the same story repeated by different advices from Paris, Brussels, the Hague, and from every great town in Europe; notwithstanding the multitude of annotations, explanations, reflections, and various readings which it passes through, our time lies heavy on our hands till the arrival of the fresh mail: we long to receive further particulars, to hear what will be the next step, or what will be the consequences of that which we have already taken.' He proposes, in the scarcity of foreign news, to establish a journal which shall give the occurrences of every little town, village, or hamlet within the range of the Penny-Post—that is to say, within ten miles of London. The paper of the 'Spectator' containing this proposal is the source of the most popular jocularities of the present passing day; but for all that, the scheme has been carried out in serious earnest. The only difference is, that as the Penny-Post embraces now the whole kingdom, instead of a single journal of news, there are hundreds, each district having one or more sheets to take care of its own village and hamlets.

Political libels were still the great sin of the press; and when Queen Anne had been ten years on the throne, she made an attempt, by means of her parliament, to impose some restrictions. Journalism, however, had now risen into respectability, and a general repugnance was manifested against any overt act of interference: but its enemies hit upon a plan which remains in force to this day. A penny stamp on a whole sheet, and a halfpenny on a half-sheet, together with the duty of a shilling on each advertisement, did more mischief than a censorship: many of the journals were at once discontinued; others united into one publication; even the 'Spectator,' having been obliged to increase its price, was dropped for want of sufficient circulation; and Swift wrote to Stella that 'all Grub Street was ruined by the Stamp Act.' The formidable character of the press at this time is shown both by the good and bad fortune of Steele. This witty writer was rewarded for his journalism with the appointment of commissioner of the Stamp-Office; but when he had the folly to give up his place for a seat in parliament, his talent as a public writer showed itself to be so intractable, that the whole power of the ministers was used to obtain his expulsion, which, with some little difficulty, they effected. Later than this the press rendered good service during the rebellion of 1745: and Fielding, from the editor of the 'True Patriot,' became a Bow-Street magistrate.

Dr Johnson describes thus the public press of his time:—'No species of literary men has lately been so much multiplied as the writers of news. Not many years ago the nation was content with one gazette, but now we have not only in the metropolis papers for every morning and every evening, but almost every large town has its weekly historian, who regularly circulates his periodical intelligence, and fills the villagers of his district with conjectures on the events of war, and with debates on the true interests of Europe.' He tells us that the knowledge of the common people of England is remarked by all foreigners to be greater than that of any other vulgar; and this he accounts for by 'the rivulets of intelligence which are continually trickling among us, which every one may catch, and of which every one partakes.'

Footes, like Ben Jonson in another age, did everything in his power to make the press ridiculous; but dramatic criticism began to appear in the newspapers in his time. Before then, the doings of the theatres were chronicled merely in the way of news, and one newspaper paid £200 a year for such intelligence. When criticism, however, was added, the tables were turned, and the press obtained a superiority it has never relinquished. The theatres, instead of receiving £200, laid out at least £1000 in newspaper advertisements.

Since the time of Cromwell, no authorised reports of proceedings in parliament had appeared in the journals, although from time to time certain newspapers continued to publish them on the chance of impunity.

This custom at length grew into a kind of privilege, and was a part—and a highly important one—of the liberty of the age. The newspapers became bolder—they had even the audacity to give names in full; and at length, in 1771, the ire of parliament was awakened, and the question brought fairly to issue. Two printers were taken into custody under the Speaker's warrant, and discharged by the lord mayor Wilkes and his brother magistrate Oliver. The result was that the city dignitaries were committed to the Tower. Parliament, however, dared not go farther. On the prorogation the prisoners left the Tower in triumph; and the right assumed by the press of printing the debates has never since been called in question. This, however, should not be mistaken for what our author calls it—a triumph of the press. It was a triumph of public liberty; and if the pulpit, instead of the press, had chanced to be identified with it in the matter in question, the result would have been the same.

The newspaper annals of the present century are full of progress, libels, government prosecutions, and struggles of the unstamped. A few great papers absorb attention by their magnitude and importance; for as the system advanced, its obvious tendency was to direct the current of popularity into particular channels. This proceeded remotely from the moral gregariousness of men, but proximately from the circumstance of the struggle to secure and extend popularity involving so immense a capital as to confine competition for the first rank to a very small number. Of these great papers, the 'Public Advertiser' was the earliest of the daily tribe which attained to enduring reputation. It was the arena of Junius, although the popularity of his celebrated letters did not effect the wonders in the circulation of the paper which have been attributed to them. The 'Morning Chronicle' commenced in 1769, and at the beginning of the French Revolution became the property of Mr Perry and Mr Gray. Coleridge and Campbell both wrote for it, but with the usual ineffectiveness of mere literary men, who want the readiness demanded by journalism. The 'Morning Post' originated in 1772. The 'Morning Herald' was established in opposition to the 'Post' in 1780. The 'Times' began its surprising career in 1788, and was at first chiefly distinguished by being printed 'logographically,' that is to say, by types forming entire words, instead of letters. The efforts of Mr John Walter, however, the logographic printer, were less successful than those of the late Mr Walter with his steam-press, which, by successive improvements, is now capable of producing 8000 copies in the hour. Among other plans fallen upon by this Mr Walter for obtaining efficient literary assistance, was his encouraging a supply of 'letters to the editor,' which frequently led him to the discovery of a clever writer. His example in this respect was zealously followed by his chief editor, the late Mr Barnes, who never missed the opportunity of obtaining, at any cost, the assistance of a promising pen. The writer of these columns remembers, that when he was a young literary man upon town, an article of his in the 'Foreign Quarterly Review' chanced to attract the attention of Mr Barnes; upon which he immediately sought out the editor of the 'Review,' to inquire whether his unknown contributor would accept of a parliamentary reportership. By such zeal, and by liberal, not to say lavish rewards to its authors, the 'Times' was able to take advantage of those political currents which carried it to the first rank in the field of journalism. In addition to these morning papers, the publicans are represented by the 'Morning Advertiser,' one of the earliest established; and within the last few years there came into the field the 'Daily News,' with the avowed intention of underselling the rest, although it found itself obliged eventually to come up to the standard price. Several other speculations of the kind have been tried, with abundance of money, and of literary talent: but the elements of success in such works seem to be wholly peculiar, and both capitalists and literary men were soon put *hors de combat*.

'A summary of the British newspaper press,' says Mr Hunt, 'arranged according to locality and to political bias at the end of the year 1849, offers the following results:—In London, 113 papers; in England, 223; in Wales, 11; in Scotland, 85; in Ireland, 101; in the British islands, 14. General summary: Liberal papers, 218; Conservative, 174; Neutral, 155. The total number of journals, of all shades of opinion, being 547.' On a fully-appointed London morning paper upwards of 100 persons are regularly employed in the printing and business departments alone; and the following is a general summary of *weekly* expenses:—

'Editing, writing, and reporting a double paper during the session of parliament, - - - - -	L.280
Foreign and local correspondence, - - - - -	100
Printing, machining, publishing, and general expenses, double paper, with occasional second and third editions, and an evening edition three days a week, - - - - -	200
Weekly total, - - - - -	L.520'

'The prevalence or scarcity of newspapers in a country,' says our compiler, 'affords a sort of index to its social state: where journals are numerous, the people have power, intelligence, and wealth; where journals are few, the many are in reality mere slaves.' This is one of those external facts which the social physiologist may remark; but journalism will be treated by the philosopher as something very different from a mere symptom of national prosperity. We are accustomed to look upon 'the Press' as some powerful and external engine which men may adapt as they please to their own purposes; but the fallacy of the notion may be deduced clearly enough even from so slight a sketch as the foregoing. No effort, no power, no will can establish a journal whose place is not already made in the public mind. Without this, money is useless, and talent vain. Mr Murray drenched the 'Representative' with his treasure, as Mr D'Israeli did with his genius, and all to no purpose. Mere literary men, in fact, unless possessing unusually observant minds and plastic pens, are always bad journalists; for their papers are exponents of their own idiosyncrasies, not of the public thought. A journal does not, in the common phrase, address a certain class of readers: it is the voice of these readers themselves. It is the expression of an idea previously existing in their minds, or the supply of a thing for which their souls even unconsciously thirsted. A journal may be the voice of an individual; but the power of the voice depends upon the echoes which take it up, and which prolong and infinitely multiply its vibrations. No journalist is, in the strict sense of the word, original—if he were so, he would be alone: he is merely the mouthpiece, the agent, the representative of his readers, and he employs his energies in collecting the peculiar aliment which their taste demands, and which their intellectual constitutions are capable of assimilating. These are facts which journalists know practically—instinctively; and it has often been said that the greatest of all our existing newspapers owes its success to the unwearied care with which it watches the changing tide of public opinion, so as to appear to direct that mighty current on which it only floats.

It is essential to observe this identity of journalism and the stuff of which the minds of aggregates of men are composed. Without this, we shall always be floundering from one mistake into another, and shifting the blame or the merit from the agent to the instrument. We praise, for instance, the zeal of the press in catching up foreign news the instant it *approaches* our shores; but we fail to remark that the success of these efforts depends upon the most wonderful mail system that ever existed. 'We have now nearly a hundred and fifty steamers,' says the 'Hants Advertiser,' 'most of them of the greatest power and speed, engaged specially in bringing political and commercial intelligence from all parts of the world. They are never delayed at any port at which they may touch, but for the purpose of *coaling, landing and embarking* mails; and their rapid

and punctual arrival in the country, after in some instances running a distance of three thousand miles without stopping, is one of the wonders of this remarkable age.' Journalism, in fact, is merely a portion of the civilisation, the freedom, the greatness—and of the subserviency, the meanness, and the iniquity—of the time and country.

There are portions of the press which would be a disgrace to any age—which pander to the vices that everywhere exist in large populations, and draw a foul subsistence from the very garbage of human nature. Of these we are very properly loud in our condemnation; but it would be well to reflect that such journals are but instruments, voices, exponents, like other journals; and the reflection will teach us that reform must take place in character, not in mere expression. The present, however, with all its greatness, is decidedly the age of Tinkering. To encourage sobriety, we would shut up the public-houses: but when the question is to dispel ignorance and elevate the moral feeling by means of education, we fail to arguing about the mode, and postpone the task *ad infinitum*. Pains and penalties inflicted upon the instruments are of little avail in putting down the base part of the press. We must deprive such papers of their field of circulation by raising the public mind above their level. In like manner, the littlenesses that deform even the greatest journals are *our own*, and we must rise above them in our own minds before they will cease to exist in the exponents of our feelings. Journalism, in short, being simply public opinion expressed in a periodical form, is a perpetual reflection of the sentiments and intellect of the nation, and a gauge by which we may measure both its advance and its shortcomings. To write its history, therefore, is to trace the progress of civilisation, and to prophesy of the future of mankind.

We should not conclude without saying that Mr Hunt's volumes contain a much greater mass of materials on the interesting subject he has chosen than can be found elsewhere in a single work; and that, if our object in the perusal had been to select amusing and striking extracts, we could with great ease have filled the whole number.

AN ADVENTURE IN THE RED SEA.

FROM my infancy I had longed to visit the scenes memorable from their association with Scripture. The vivid pictures of the sacred historian being the first presented to my imagination, had most profoundly impressed it; and my feelings when, in 1842, I actually stood upon the shore of the Red Sea, I should vainly endeavour to describe. Before us lay a sea of the deepest blue, in comparison with which the Mediterranean would look faded; it was scarcely broken by a ripple, and all over it danced and flashed the beams of such a sun! for it was near the end of May, and the heat was daily attaining greater power. On the opposite shore of that narrow arm of the sea which runs up to Suez, we could distinguish a party of travellers on camels, attended by an Arab escort. They had probably just crossed the gulf; a little beyond them the mirage favoured us with a ghostly reflection of Suez, very blue and indistinct. At no great distance from us lay our own baggage-camels, quietly feeding; and close to the beach was an Arab boat with its crew waiting to convey us to the steamer that lay some little distance out, the water being too shallow, and the coral rocks too numerous, to allow it to come nearer to the town. Indeed (as we saw afterwards) a little steamer belonging to Mehemet Ali had got aground much lower; and day by day, for nearly a year, the worthy imams had been down to pray Allah for its removal to safe floating again, making, however, no other effort to effect such an event. Of course it was 'written on the steamer' that it should not float, and float it did not; probably it is there still. The whole scene presented to us was one of busy life and glad sunshine; and as one

gazed, it grew difficult to remember that these joyous waters

— Rolled
Over Pharaoh's crown of gold —

over the might and the majesty of old Egypt.

But the yellow-slipped and stockingless owner of our boat gave us little time for reflection, summoning us almost directly on board, as the steamer wanted to be 'under weigh' before sunset; and we embarked, seated for the first time in the Oriental fashion on the little half deck, there being no seats. As the oars of our crew fell into the water, they broke into a wild chant, the effect of which was very good. They did not sing in parts, but alternately, catching the notes from each other in a very singular manner. Thus, amidst music and sunshine, we began a voyage which, from several causes, proved very disagreeable and unpropitious. The number of passengers that embarked proved too great for the size of the steamer; we were consequently much crowded; the heat on board was more intolerable than one can imagine—that of India appeared as nothing after it—and the vessel literally swarmed with cock-roaches.

Not even a distant view of Sinai, a nearer one of Mount St Agnes, nor the infinite variety which the surface of the sea itself presented, could compensate for the horrors of that burning climate and its disgusting vermin. Under any other circumstances we should have found a resource from the ennui of a voyage in watching the motley groups that composed our ship's company. There were at least seventy passengers besides the captain and European sailors, the negroes and Nubians who worked in the engine-room, and upwards of twenty Parsee, Mohammedan, and Hindoo servants. On the paddle-box the Nubian pilot was generally to be seen; a magnificent figure, attired in long flowing robes of white, that contrasted admirably with his ebony skin and glittering black eyes. At his evening orisons he really offered a charming subject for a sketch, but an intention of taking it never occurred to us then; physical suffering renders one almost blind to the picturesque, and it was only by a strong effort that we could bear up against that terrible overpowering heat. Never before had we been at all aware with how much propriety the superstition of the dark ages had condemned evil spirits to an abode beneath those scorching waters! As we approached the Straits of Bab-el-Mandeb, the thermometer rose, and a day of unusual heat and exhaustion was followed by a still more burning night. I had good cause to remember it! A daughter of Lady A——'s shared my cabin, which was just outside the saloon, and had no outer door, in place of which the entrance was closed by a canvas curtain. We had opened the port-hole, but no breath of air entered. It was a dead calm. The steamer was cutting her way through a sea of glass, apparently surrounded by an atmosphere of fire. The gentlemen had gone on deck to sleep, as the saloon would have resembled the Black Hole of Calcutta had its usual occupants remained in it; only a Parsee or two lingered below to wait, if required, on the ladies, for I need scarcely say that there were no stewardesses on board an Oriental steamer. Miss A—— proposed that we should have the lamp suspended in our cabin extinguished, in order to diminish the heat. It hung too high to be reached by either of us, and her mother's maid was ill, and had gone to bed; we were therefore compelled to call in one of our Eastern attendants to put it out; and doubtless, during the time he obeyed our command, he took with his downcast black eyes a quick survey of the apartment, thus becoming aware that my mattress was placed on two large trunks to raise it from the deck; for in those days the Red Sea steamers were totally unfurnished except the saloon, and we had to use the things provided for our desert *trajet*, amongst which, of course, we did not count a bedstead or cot. The light out, we were both soon asleep. About midnight, however, my slumber was disturbed by feeling a heavy pressure on my throat. I sat up, fancying I was suffering from nightmare, and found

Lady A—— at the canvas door holding a lamp, and in her night-dress. She asked 'if anything had disturbed me!' I told her I had been dreaming some one was choking me. She laughed, told me her daughter, Mrs F——, who slept in her room, had also been distressed by a dream; 'she supposed the heat affected us both'—and then withdrew with the light. A second and a third time the same cause awoke me; and each time I found Lady A—— in the room! It was singular. The last time I fancied that, as I opened my eyes, I saw in the light of Lady A——'s advancing lamp a tall, muffled figure, with terrible black eyes, bending over me. This dream, or reality, whichever it was, so completely 'frightened sleep,' that it visited me no more that night: I begged her light, and read till daybreak. The next morning Lady A—— told me that her daughter had three times in the course of the night awoke her, and sent her to our room, having as often dreamed, with painful distinctness, that a tall dark man was murdering us. She at first thought we had both been disturbed by a dream, but my faint glimpse of a retreating figure the third time convinced me that there had been something of reality in the matter, especially as some favourite rings of mine were missing. So, with Lady A——'s concurrence, I determined (not to make a disturbance about what might prove a false alarm) to sit up the next night and watch for my nocturnal visitor, who, if he had been disturbed by Lady A—— the last night, might probably venture another visit the next. Lady A—— promised also to sit up, and come to me if I called her. Ten o'clock came. A Mohammedan, whose eyes at daylight had appeared to me strangely like those of my dream—if it were a dream—brought me a cup of coffee, assuring me with Oriental courtesy that 'it would do missee good.'

The attention was a little suspicious; so, though I took the cup, I drank none of its contents, but poured them away, and returned it to him empty. I wished him to think I had taken it. Then I dropped the canvas screen, kept the lamp burning, took a book, and read. Very slowly and heavily passed the hours. Oppressed by heat, I could scarcely resist my inclination to sleep. The words I read had little meaning for me, and I forgot incessantly the subject of the page as I listened to the dash of the waves against the side of the vessel—a sound which was gradually lulling me to repose, when, with a clash that startled me, twelve o'clock was struck on the ship's bell. I was thoroughly awake then, and looking up, suddenly perceived the long fingers of a black hand grasping the side of the canvas screen in the act of withdrawing it. I called loudly for Lady A——, and moved hurriedly to the doorway. She was with me in an instant, but no one was visible outside. As she had not met him in coming from her cabin, it was evident that the intruder had taken refuge in the saloon—he had no other retreat. We resolved to seek him there. I have since thought we did a brave, if not a rash action in following him, alone as we were; but the lady who proposed it is such a model of gentle courage and quiet resolution, that one never thinks of fear when with her. The saloon was shaped like a T, from the (now empty) bed-cabins that projected into it, the upper part of the latter being towards the stern, and containing a number of couches formed on the lockers, as they are called. We searched it throughout. We looked under the long table—under the sofas—everywhere. There was no sign of Mohammedan or Christian! Lady A—— now came to the conclusion that both nights I must have been dreaming. It is very provoking to be suspected of sleeping when one is convinced of one's own wakefulness: I was certain of my recent vision's *materiality*, and therefore intreated Lady A—— to come out of the saloon, and wish me 'good-night' in a loud voice; but instead of leaving me, to slip behind my screen, and 'mark the event,' She good-naturedly complied, and a few minutes proved that I had not been deceived. Very slowly and stealthily we heard some one issue from the saloon, and on peeping through the aperture left by the curtain, we saw a tall muffled figure, such as I had described, steal up the ladder leading to the deck. There could no longer be

any doubt; though how the robber had eluded our search was, and continues to be, a mystery. It is probable, however, that he crept out of one of the stern port-holes or windows, and hung by his hands till we left the room; the complete power the Arabs and all Orientals possess over their limbs rendering it an easy task for him afterwards to effect his return by the same ingress. What was now to be done? We had not thought of catching him in his rapid flight up the ladder. Nay, I doubt if we could. Lady A—— (as I declared that I could not identify him from his twenty comrades, and as we left the steamer at Aden the next day or the following one) proposed that we should keep the affair secret, as any inquiry into the matter would be fruitless, and make a disturbance for nothing. To this I agreed, but kept watch till daybreak. We were one more night on board, not arriving at Aden till four or five o'clock in the morning of the second day, but I did not make it a vigil. One of Lady A——'s sons—a cavalry officer—came down and slept on the saloon table, two other gentlemen occupied the sofas; and thus within reach of protection, we ventured to sleep quietly, and without fear.

The robber's intention in thus daringly entering my cabin was probably to open and plunder the trunks on which I slept. He imagined probably that they contained articles of value, for the better security of which I had had my mattress placed on them, and hoped quietly to displace me; intending perhaps, if I awoke, to insure my eternal silence. It is very certain I could not have called for help with that evil grasp upon my throat! The boldness of the attempt, though it might surprise a European, was not singular in the East; as we were told that in India instances had occurred of officers having been robbed of the sheet on which they slept without being awakened! Lady A——'s appearance had, however, startled him from his prey, and obliged him to seek a hiding-place in the saloon by means of the inner door of my cabin.

It was with great delight that I heard the announcement of our arrival at Aden, where we were to embark in another vessel, and quit the Red Sea for the Indian Ocean. The vague dreams of beauty and solemnity I had formerly attached to it were gone; and it has ever since been associated in my mind with a feeling of horror and dislike; although of course I felt, and do feel very thankful for the escape which I made upon its blue fatal waters.

STEAM-BRIDGE OF THE ATLANTIC.

IN the summer of 1838 the Atlantic Ocean was crossed for the first time by vessels exclusively propelled by steam-power. These pioneers were the *Sirius* and the *Great Western*—the former built for another class of voyages, and afterwards lost on the station between Cork and London; the latter built expressly for Atlantic navigation, and which has ever since been more or less employed in traversing that ocean. Other ships followed: the *British Queen*, afterwards sold to the Belgian government; the *Great Liverpool*, subsequently altered and placed on the line between Southampton and Alexandria; and the *President*, lost, no man knows how or where, in the year 1841. Then came what is called 'Cunard's Line,' consisting of a number of majestic steam-ships built in the Clyde, to carry passengers and mails between Liverpool in Europe, and Halifax, Boston, and New York in America; a service they have performed with the most marvellous regularity. The only great misfortune that has befallen this line has been the loss of one of the vessels, the *Columbia*, which, in nautical phrase, 'broke her back' on some rocks on the American shore of the Atlantic. Then came the *Great Britain*, the greatest of them all, differing from the others in two respects—first, in being built of iron instead of wood; and second, in being propelled by the Archimedean screw instead of by the old paddle-wheels; and, alas! she has differed from them all in a third respect, inasmuch as neither the same good-luck at-

tended her as in general fell to the lot of the ships of the Cunard Line, nor the same irretrievable bad fortune as was met by the *President* and the *Columbia*; for, after having made several voyages very successfully, she, to the amazement of all mankind, very quietly went ashore in Dundrum Bay, on the east coast of Ireland, from whence, after spending a most uncomfortable winter, she was brought back to Liverpool, and now lies in the Bramley-Moore Dock there, like a huge mass of iron suffering under premature rust. But all this time these ocean steamers that periodically brought to New York passengers and intelligence from Europe were British built. They had been constructed in the Avon, the Mersey, and the Clyde, the greater number having been launched in the same waters as first received Henry Bell's little *Comet*. Why did America not embark in such enterprise? As regards steam navigation, Fulton was before Bell; New York before Glasgow; the *Fulton's Folly* before the *Comet*; and was

'The greatest nation
In all creation'

to be outdone in the field of enterprise by the old Britishers? American pride said 'No'; American instinct said 'No'; and, above all, American capitalists said 'No!' Keels were laid down in New York; the shipbuilders' yards became unusually active; and the stately timbers of majestic ships gradually rose before the admiring gaze of the citizens of the great republic.

But the race of William the Doubter is not yet extinct, and many, as usual, shook their wise heads at the enterprise. It was admitted that in inland navigation the Americans had beaten the world; that except an occasional blow-up, their river steamers were really models of enterprise and skill; but it was gravely added, the Mississippi is not the Atlantic; icebergs are not snags; and an Atlantic wave is somewhat different from an Ohio ripple. These truisms were of course undeniable; but to them was quickly added another fact, about which there could be as little mistake—namely, the arrival at Southampton, after a voyage which, considering it was the first, was quite successful, of the American-built steam-ship *Washington* from New York. There seemed to be a touch of calm irony in thus making the *Washington* the first of their Atlantic-crossing steamers, as if the Americans had said, 'You doubting Britishers! when you wished to play tyrant over us, did we not raise one *Washington* who chastised you? and now that you want to monopolise Atlantic navigation, we have raised another *Washington*, just to let you know that we will beat you again!'

The *Washington*, however, was only the precursor of greater vessels. These were to sail between New York and Liverpool, carrying the mails under a contract with the American government. In size, and speed, and splendour of fittings, these new ships were to surpass the old: even their names were, if possible, to be more grand and expressive. The vessels of Cunard's Line had lately appropriated the names of the four great continents of the globe, but the oceans remained, and their names were adopted; the new steamers being called the *Atlantic*, *Pacific*, *Arctic*, *Baltic*, and *Adriatic*. The first of these was despatched from New York on the 27th of April last, and arrived in the Mersey on the 10th of May, thus making the passage in about thirteen days. The voyage would have been made in a shorter time but for two accidents: the bursting of the condenser; and the discovery, after the vessel was some distance at sea, of the weakness of the floats or boards on the paddle-wheels. About two days were entirely lost in making repairs; and the speed was reduced, in order to prevent the floats from being entirely torn away from the paddle-wheels. These things considered, the passage was very successful. The average time occupied during 1849 by the vessels of the old line between New York and Liverpool was 12½ days; but their voyages were longer than those of the *Atlantic*, as they called at Halifax. The shortest passage was that made by the *Canada*

from New York to Liverpool *via* Halifax in eleven days four hours.

The *Atlantic* remained for nineteen days at Liverpool; and during all that time she had to lie in a part of the river called the Sloyne, in consequence of none of the dock-entrances being wide enough to allow her to pass in. Her breadth, measuring across the paddle-boxes, is 75 feet; of the vessels of Cunard's Line, about 70 feet; and the widest dock-entrance is barely sufficient to admit the latter. The *Great Britain*, though longer than any other steam-ship that ever entered the Mersey, is not so broad, as, being propelled by the screw, she has no paddle-wheels. A dock at the north shore is now in course of construction expressly for the accommodation of the *Atlantic* and her consorts.

For several days during her stay at Liverpool the *Atlantic* was open to visitors on payment of sixpence each, the money thus realised (upwards of £70) being paid over to the trustees of the Institution for the Blind, whose church and school are now being removed to give greater space round the station of the London and North-Western Railway. On the day of my visit crowds of people were waiting at the pier for the steamer that was to convey them to the *Atlantic*. Whitsuntide visitors from the manufacturing districts were hastening on board the numerous vessels waiting to take them on pleasure excursions to the Isle of Man, North Wales, or round the light-ship at the mouth of the river. There was great risk of making mistakes in the hurry; and the remark of an old sailor, that the vessel could 'easily be known by the Yankee flag flying at the fore,' served only still further to confuse the many, who could not tell one flag from another. However, a small-tug steamer soon appeared with a dirty piece of hunting, just recognisable as the famous 'star-spangled banner,' flying at the fore; and her deck was in a few minutes so crowded, that orders were issued to take no more on board, and away we steamed, leaving about a hundred people to exercise their patience until the steamer's return. A man at my elbow, who afterwards appeared in the capacity of money-taker, whispered, 'There's the *captin*!' and on looking up the gangway, I saw—

'A man of middle age,
In aspect manly, grave, and sage,'

looking calmly in the direction of the colossal ship of which he was the commander; his complexion browned by exposure to sun and wind, storm and spray; and his whole demeanour indicating the calm strength acquired by long familiarity with the elements in their roughest moods. As we approached the ship, her appearance was not prepossessing. She is undoubtedly clumsy; the three masts are low, the funnel is short and dumpy, there is no bowsprit, and her sides are painted black, relieved only by one long streak of dark-red. Her length between the perpendiculars—that is, the length of her keel—is 276 feet; breadth (exclusive of paddle-boxes), 45; thus keeping up the proportion, as old as Noah's ark, of six feet of length to one of breadth. The stern is rounded, having in the centre the American eagle, clasping the starred and striped shield, but no other device. The figure-head is of colossal dimensions, intended, say some, for Neptune; others say that it is the 'old Triton blowing his wreathed horn,' so lovingly described by Wordsworth; and some wags assert that it is the proprietor of the ship blowing his own trumpet. The huge bulk of the *Atlantic* was more perceptible by contrast with the steamer—none of the smallest—that was now alongside; for though the latter was large enough to accommodate about four hundred people on deck, yet its funnel scarcely reached as high as the bulwarks of the *Atlantic*. The diameter of the paddle-wheels is 36 feet; and the floats, many of which, split and broken, were lying about in the water, are nearly 15 feet long. The depth of the hold is 31 feet, and the estimated burthen 2860 tons, being about the same as the *Great Britain*,

and about 500 tons more than the ships of the old Cunard Line.

Like all the other Atlantic steamers, the run of the deck is almost a straight line. Around the funnel, and between the paddle-boxes, is a long wooden house, and another is placed at the stern. These contain the state-rooms of the captain and officers; and in a cluster are to be found the kitchen, the pastry-room, and the barber's shop. The two former are, like similar establishments, replete with every convenience, having even a French *maître de cuisine*; but the latter is quite unique. It is fitted up with all necessary apparatus—with glass-cases containing perfumery, &c.; and in the centre is 'the barber's chair.' This is a comfortable, well-stuffed seat, with an inclined back. In front is a stuffed trestle, on which to rest feet and legs; and behind is a little stuffed apparatus like a crutch, on which to rest the head. These are movable, so as to suit people of all sizes; and in this comfortable horizontal position the passenger lies, and his beard is taken off in a twinkling, let the Atlantic waves roll as they may. The house at the stern contains a smoking-room, and a small apartment completely sheltered from the weather for the steersman. The smoking-room communicates with the cabin below, so that, after dinner, those passengers so disposed may, without the least exposure to the weather, or annoyance to their neighbours, enjoy the weed of old Virginia in perfection. This smoking-room is the principal prospect of the man at the helm, who, however, has to steer according to his signals. Before him is a painted intimation that one bell means 'port,' and two bells mean 'starboard;' a like intimation appears on the large bell in the bow of the ship; and according to the striking of the bell, so must he steer.

Proceeding below, we come to the great saloon, 67 feet long, and the dining-saloon, 60 feet long, each being 20 feet broad, and divided from each other by the steward's pantry. This pantry is more like a silversmith's shop, the sides being lined with glass-cases stored with beautifully-burnished plate; crockery of every description, well secured, is seen in great quantities; and the neatness of arrangement shows that the gilded inscription, full in the sight of every visitor—'A place for everything, and everything in its place'—has been reduced to practice. Above the tables in the dining-saloon are suspended racks, cut to receive decanters, glasses, &c. so that they can be immediately placed on the table without the risk attendant on carrying them from place to place. The two saloons are fitted up in a very superior manner: rose, satin, and olive are the principal woods that have been used, and some of the tables are of beautifully-variegated marble, with metal supporters. The carpets are very rich, and the coverings of the sofas, chairs, &c. are of the same superior quality. The panels round the saloons contain beautifully-finished emblems of each of the states in the Union, and a few other devices that savour very strongly of republicanism. For example, a young and beautiful figure, all radiant with health and energy, wearing a cap of liberty, and waving a drawn sword, is represented trampling on a feudal prince, from whose head a crown has rolled in the dust. The cabin windows are of beautifully-painted glass, embellished with the arms of New York, and other cities in the States. Large circular glass ventilators, reaching from the deck to the lower saloon, are also richly ornamented, while handsome mirrors multiply all this splendour. The general effect is that of chasteness and a certain kind of solidity. There is not much gilding, the colours used are not gaudy, and there is a degree of elegant comfort about the saloons that is sometimes wanting amid splendid fittings. There is a ladies' drawing-room near the chief saloon full of every luxury. The berths are about 150 in number, leading out, as usual, from the saloons. The most novel feature about them is the 'wedding-berths,' wider and more handsomely furnished than the others, intended for such newly-married couples as wish to spend the first fort-

night of the honeymoon on the Atlantic. Such berths are, it seems, always to be found on board the principal river-steamers in America, but are as yet unknown on this side of the water. Each berth has a bell-rope communicating with a patented machine called the 'Annunciator.' This is a circular plate about the size of the face of an eight-day clock, covered with numbers corresponding with those of the state-rooms. Each number is concealed by a semicircular plate, which is removed or turned round as soon as the rope is pulled in the state-room with the corresponding number. A bell is at the same time struck to call the attention of the stewards, who then replace the plate in its former position, and attend to the summons.

The machinery which propels the ship consists of two engines, each of 500 horse-power, the engines of the old line being also two in number, but only about 400 horse-power each. Such cylinders, and shafts, and pistons, and beams are, I believe, unrivalled in the world. There are four boilers, each heated by eight furnaces, in two rows of four each. The consumption of coal is about fifty tons every twenty-four hours; 'and that,' said one of the engineers, 'is walking pretty fast into a coal-mine, I guess!' According to the calculations of the very wise men who predicted the failure of Atlantic steam navigation, such a vessel as the *Atlantic* ought to carry 3700 tons of coal; but it will be seen that one-fourth of that quantity is more than enough, even making allowance for extra stores to provide against accidents. In the engine-room is a long box with five compartments, each communicating with a wire fastened like a bell-pull to the side of the paddle-box. These handles are marked respectively—'ahead,' 'slow,' 'fast,' 'back,' and 'hook-on'; and whenever one is pulled, a printed card with the corresponding signal appears in the box opposite the engineer, who has to act accordingly. There is thus no noise of human voices on board this ship: the helmsman steers by his bells, the engineer works by the telegraph, and the steward waits by the annunciator.

Two traces of national habits struck me very much. Even in the finest saloon there are, in places where they would be least expected, handsome 'spittoons'—the upper part fashioned like a shell, and painted a sea-green or sky-blue colour—thus giving ample facility for indulging in that practice of spitting of which Americans are so fond. Again, much amusement was caused by the attempt of one of the officers in charge of the communication between the small steamer and the *Atlantic* to prevent the gentlemen from leaving the latter until the ladies had seated themselves on the former. The appearance of the deck, crowded with ladies only, and a host of gentlemen kept back, some impatient to get down, but the greater part entering into the humour of the thing, was quite new to English ideas. It is but fair to add that the ladies did not seem to like it; and that, when the steamer again came alongside, it was not repeated.

Upon the whole, this Atlantic steamer is really worthy of the great country from which she has come. If, in shape and general appearance, she is inferior to the old vessels, she is decidedly equal, if not superior, to them in machinery and fittings. Her powers as regards speed have of course yet to be tried. One voyage is no test, nor even a series of voyages during the summer months: she must cross and recross at least for a year before any just comparison can be instituted. The regular postal communication between Liverpool and the United States will speedily be twice every week—the ships of the new line sailing on Wednesday, and the old on Saturday.

But other ports besides Liverpool are now despatching steamers regularly to America. Glasgow sent out a powerful screw steamer—the *City of Glasgow*, 1087 tons—on 16th April for New York, where she arrived on 3d May; thus making the passage in about seventeen days, in spite of stormy weather and entanglements among ice; the average time taken by the Liverpool

steamers during 1849 being fourteen days. Her return voyage, however, made under more favourable circumstances, was within this average—the distance being steamed between the 18th May and the 1st June. A vessel called the *Viceroy* is about to sail from Galway to New York, and her voyage is looked forward to with considerable interest. The *Washington* and *Hermann* sail regularly between Bremen and Southampton and New York, and the *British Queen* has been put on the passage between Hamburg and New York. All these enterprises seem to indicate that ere long the Atlantic carrying trade will be conducted in steamships, and sailing vessels superseded to as great extent as has been the case in the coasting trade.

THE FRENCH POLICE.

MUCH is heard of the system of French police—its petty regulations with respect to personal movement, its spying into private affairs, and its wide and deep ramifications through society. The perfection which this institution has attained is a result of long experience; first, under a series of despotic monarchs; next, under the republican leaders; and lastly, under the Emperor Napoleon, who was its great consolidator and improver—the curious thing being, that no form of government which the French people adopt ever relieves them in the slightest degree from the trammelling ordinances of their police. Indeed one would be inclined to suppose that the more friendly to liberty any government in France affects to be, the more numerous and vexatious must be its restrictions. But as the French mind is absorbed exclusively in the chase of principles in the abstract, vexations of this sort, which are altogether practical, do not appear to incur public resentment.

Let us take a glance at the more recent history of this extraordinary institution. When the police system was concentrated in the hands of a prefect in 1800, it acquired dignity and power. Dubois was the first prefect, and he showed himself equal to his task. He ordained a vast number of arrangements respecting passports, gambling-houses, lodging-houses, printing, and other matters connected with life and trade in Paris. After this he devoted himself to public improvements, allowing no obstacle to stand in the way of his designs. Dubois was a great man. By the expression of his will, backed by Napoleon, he effected sanitary improvements which would require years of legislative battling in England. The vast sewer, through which an army could march, which runs beneath the Rue St Denis, was his work, hastened on by Napoleon, who one morning astonished the people on the Place du Châtelet by emerging from the bowels of the earth after several hours' journey under ground. Pasquier, who succeeded Dubois in 1810, strove to add to his other acts of utility a thorough reform in the manners of the police, hitherto rude and brutal. For the time being he was successful. He then looked back to the archives, and drew from them every useful inspiration. Public security was never greater, salubrity was rigidly attended to, a council of health was founded, Paris was better lighted, the body of firemen reconstituted, the sale of charcoal regulated, and the capital insured a proper supply of provisions. But Pasquier was a blind instrument of his master; and his persecutions of poets and satirists are not yet forgotten, while Béranger yet smiles at his attempts to discover the authorship of the 'Roi d'Yvetot.' The great Mallet conspiracy to overthrow the Emperor showed how the police could sometimes be caught; but Pasquier escaped the anger of Napoleon, and remained at his post until the Restoration. His care during the excitement of the marriage of Napoleon and Marie-Louise, his energy at the great fire in the Russian embassy, and at the overflow of the Seine in 1813, showed his value as a minister of public order.

The Restoration established a Direction of the Police of the kingdom, and greatly disorganized the whole af-

fair; but when Napoleon's return from Elba alarmed the monarchy, the system was reorganized, and the ministry and prefecture of police were re-established. In 1818 it was united to the home office (*interieur*), to become again 'General Direction' in 1820, and again a department of the interior in 1822. The prefect of the Empire had been a most important functionary. His duty was—to see to the passports, cards of safety, and permissions of residence in Paris; to watch over mendicity and vagabondage; the prisons and Bicêtre; to overlook places of public resort; to prevent crowds; to watch over publications of all kinds; over printing-offices and theatres, and to fix the hours of their closing; over the sale of powder and saltpetre; the regulation of emigrants; the survey of public worship; the bearing of arms; the search after deserters; the public festivals; the licenses of hawkers; the care of the safety and health of the town; the attention to fires, accidents, and floods, and the regulation of the Bourse and money-changers; the safety of commerce; taxes and fines; the free circulation of food; the overseeing of patents and prohibited goods; the survey of every public-house, market, &c.; and the preservation of all monuments. He had under his orders the commissaries of police, officers of peace, the commissaries and inspectors of markets, exchanges, and ports, the spies, gendarmes, and firemen. The functions of the prefect, where authority was arbitrary and despotic, were of the highest importance. From the year 1796 to 1814 there were three eras in police history. The first, that of the Republic, being the police of terrible times, was terrible; that of the Consulate was trivial, and sought to amuse the public mind; that of the Empire was chiefly administrative.

The worst era in the history of the French police is that from 1815 to 1830. The institution was during this time more bitter, more severe, more suspicious, more inquisitorial, because more political, than it had ever been before. Abandoning the interests of the city of Paris for politics, says a historian, 'by the 20th March 1815, it had organized a secret correspondence and spy system of a nature and extent so great, that all social ties and family bonds were broken up, and at its mercy.' It is accused of instigating assassins, getting up plots, inventing treasons; and with too much truth. It succeeded at one time in wrapping in its net twenty-nine peers of France, eighteen generals, and thirty-eight artists, authors, &c. and all on anonymous denunciations. Never was personal liberty so utterly null, while newspapers, books, and plays were kept rigidly free from life and energy; in fact the direction of the police was in the hands of priests, who, from 1789 to 1815, had had little influence in France, and who now made up for lost time.

In 1821, while the prefecture of police was administered by M. Delavan, there were three distinct bodies of police in Paris, each acting as a spy on the other two: first, the police of the palace, taken from all ranks; the police of the Pavillon Marsan, filled by the Jesuits, and spreading through the whole clergy; finally, the police of the prefecture. Each of these three bodies was bound to know the plans, intrigues, and tricks of its rivals. The prefect, not to be behind-hand, and to be never taken aback, was obliged to watch the others as energetically as if they had been enemies of the state. Spies were employed in every class of society; and it was dangerous to utter an unguarded expression even in one's own house. We may give an anecdote relating to this inquisitory system:—Madame Monnier had opened a *salon*, founded under the preceding minister, and kept up because found to be useful. Madame Monnier was a clever woman, and her *salon* was the rendezvous of all the illustrious in arts, letters, capital, arms, law, and of all who liked mixed society. One heard in this place all kinds of theories, schemes, plots, &c. shouted with a loud voice in the centre of a room, round which sat three or four rows of the most lovely women in Paris. In one room music

played; in another, cards were the occupation of men who played high, and whose gambling tastes brought them every night. One evening a regular visitor to the club, and the most energetic in his expression of republican opinions, was accosted on going out by a general of the old imperial army. 'I was delighted to hear you, my dear baron,' said the general; 'you surpassed yourself. The day is not far distant when we shall dismiss the rat at the castle. Preserve your eloquence, dear baron: we shall need it. I say nothing more to you now; but wait a few days, and I will tell you something which will fill you with joy and hope.' They then embraced, and swore, with low voice and clenched teeth, death to the Bourbons, and the whole race of their present governors, and parted. Next morning the prefect of police received a letter from the director of the secret police informing him—while blaming him severely for his want of energy—that he was wanted at the château. He went.

'Well, sir,' said a person of exalted rank then in great favour, 'there are plots in Paris, and you know nothing of them!'

'Indeed, Monsieur the Duke, nothing has come to my ears, and I can promise—'

'Promise nothing until you have read this report.'

The prefect took it, and read it carefully. Having done so, he pulled another out of his pocket, and addressed the duke—'Monsieur, here is its fellow.'

The report of the duke was signed by the baron, that of the prefect by the general! The one denounced a Bonapartist plot—the other a republican. They were agents respectively of the two polices! Each had told on the other. Everybody laughed at the affair as a good joke, though such things were of frequent occurrence.

M. Debelleye, who became prefect of police in 1828, pretty well restored the institution to its original purpose. It ceased to be a political and religious inquisition, and became a machine to survey health, cleanliness, and public safety. M. Debelleye first forced proprietors to make gutters to their houses; for before his time the rain poured in torrents on your head during a shower as you walked the streets. He organized another useful reform. The Duke of Orleans, afterwards Louis-Philippe, had completed the Palais Royal at great expense; the dismal wooden galleries had been replaced by stone arcades, and the shops were gradually becoming the property of the duke. But the shops were disfigured by huge signs, many of which projected a yard, and which spoiled the appearance of the palace. But the duke feared to lose his popularity by interfering, and he went to the prefect of police, whom he soon persuaded to issue a decree with regard to signs, applicable to all Paris, but which was only intended for the benefit of the Palais Royal. The effect was excellent. The establishment of pavement, the planting of trees on the Boulevards and public places, with the *serjens de ville*, or policemen, we owe to M. Debelleye. The sword and cocked-hat, with sometimes a want of civility and good-will, are the chief faults to be found with these *serjens*, otherwise useful. The great advantage was the institution of a police, with uniform, for one secret, and without uniform. The omnibus owes its origin to this energetic prefect. Though, under Louis XIV., coaches at five sous had been tried, they failed, and were only to succeed and be carried out with vigour in 1828. He further made many regulations tending to improve morality and cleanliness.

Passing over the administration of Mangin, and various other prefects, we come to that of Delessert, the last who served under the monarchy of the restored Bourbons. The duties of this personage were extensive and onerous, as may be judged by the following facts:—Paris contains a population of about a million, and costs twelve millions of francs in police expenses. This money supported a body of 2596 infantry soldiers, 647 horsemen, 830 firemen, 300 *serjens de ville*, a number of offices, open day and night, and attended by 300

persons, besides commissaries of police, officers of peace, inspectors, agents of all kinds, comprising about 2000 persons. There were two supreme divisions in the prefecture—one political, the other municipal. The former had lynx-eyes, which pierced the deepest darkness, and watched over plots, conspiracies, and attempts at insurrection; the other, as sharp, was more palpable: the first looked after the interests only of the governors—the latter of the governed. It is even now almost impossible to pierce the veil of the organization of the first, which had no fixed system or rules, was guided by events, and changed its means of action as required. Its agents, unknown to each other, were chiefly men ruined by prodigality or vice; women of beauty and talent, but no longer young, who wanted a safe addition to their income; young men, who feigned ardour they did not feel, and extreme opinions they did not understand, to get gold for their wants, pleasures, or studies. Its resources were boundless. It moved in every circle, from the taproom to the palace-hall; its eyes were everywhere; but the very knowledge of its power sometimes defeated its object, by making conspirators act with extreme caution.

The municipal police was less mysterious. Each *arrondissement* of Paris—and there are fourteen—had a brigade devoted to it, commanded by a peace-officer, and composed of inspectors and *serjens de ville*. Their mission was, to explore every corner of the district, to see to the execution of orders and laws, to prove infractions, to repress disorder, to arrest criminals, and to give aid in all circumstances where it was required. Their duties began in the morning, and lasted until midnight, when the town was given up to other agents, and to the military authorities, who furnished patrols of the line—the National Guard, and municipal guard. As between midnight and dawn the barricades of conspirators were always raised, these patrols were more useful than mere police at this hour. Twice a day a report was sent from the district office to the prefect, who never left his cabinet without knowing the exact presumed state of the capital. One brigade was devoted to watching that the streets were free, while four remained in reserve to aid, in case of need, any district brigade requiring assistance.

The police patrols went through every street during the night, visited low quarters, the houses inhabited by vagabonds and ex-galley slaves. The inspectors of furnished hotels were, and are still, bound to visit the hotels and lodging-houses once at least every day, to inscribe the name of every arrival, with age, profession, &c. on a printed form, which was at once sent to the prefecture of police. In a town where 5000 furnished houses exist, the labour was excessive; and the number of notes sent were annually more than 1,000,000. But it became thus almost impossible for any one to hide in furnished lodgings in Paris. The service of surety surveyed the returned convicts, ex-galley slaves, and other persons of disorderly character; looked after new criminals, and arrested them, and did the whole active duty of a civil police.

In addition, it watched over the supply of provisions to the city, explored the markets, and guarded the river, the navigation of which was under its direction. Seven thousand gas-burners, 12,000 lamps, and thirty leagues of gutters, were daily visited by their eyes. They surveyed the hospitals, prisons, houses of vice of every description; watched over weights and measures; analysed preserved food and liquors. They watched over the tombs of the dead, and kept in order more than 30,000 murderers, thieves, galley-slaves, and other criminals who always infest Paris. They knew their names, slang-names, addresses, crimes, and kept an eye on their every movement. At the prefecture of police are the legal proofs of every condemnation for crime in France during more than a hundred years, so that the preceding life of any accused person can always be traced. There are in and around Paris 6000 establishments, dirty, dangerous, or unwholesome: these this

police surveyed. They provided every means of restoring life in case of accident or attempted suicide.

The importance of the duties of the Paris police will be the better appreciated when we remind our readers that on the peace of the capital depends that of France. M. Delessert did his best, and 200 useful decrees show his desire to do good. He ordered a survey over copper utensils used by cook-shops and others; over coaches let by the hour and day; removed auctions of the sheriff from the street to a handsome building; ordered extreme care in the transport of lucifers and other fulminating articles, which he never allowed to be sent with travellers, or even with other goods; fixed the price of bread anew: this was wanted. Paris has 604 bakers of four classes. The trade is a monopoly. They have to deposit security in the shape of twenty sacks of flour, while they have to keep a fixed stock. The first class, 140 sacks; the second, 110; the third, 80; the fourth, 30. This insures Paris thirty days' bread. Delessert's labours in the Council of Salubrity, and for the reform of the prisons, were most valuable.

The police has little altered since the Revolution. The municipal guard is now called the *Garde Republicaine*, the *serjens de ville* are called *Gardiens de Paris*; but the institution, its mechanism, its plans, its attributes, are scarcely altered. The Republic, while preserving all that is good, admirable, and useful in this remarkable institution, has also kept all that is barbarous, inquisitorial, and arbitrary. The defects of the administration, however, seem scarcely known to the French people, who are habituated to things—such as passports—which to us are intolerable. One thing is clear. However much we may compliment certain prefects for the excellence of their arrangements, it is certain that, with all their ingenuity, they do not prevent private murders and robberies, nor avert insurrections. On the occasion of our last visit to Paris in 1849, we saw the bodies of two men and a boy one morning at the Morgue. They had been assassinated the preceding night. Next day fresh bodies were exhibited. Now of these murders not one word was said in the newspapers of the day. Nobody spoke of them: they seemed to be matters of course. Need we say how differently a single case of homicide would have been treated by the inhabitants of London or any other English town? The truth is, that with all their discoveries in the art of organization, the French have not, till this day, been able to get up a body of plain orderly men, unarmed, to walk about quietly, yet vigilantly, as a police force. The nearest approach they have to a London policeman is their *sergent de ville* or *gardien*. But this gentleman is in a long blue greatcoat down to his heels, with a cocked-hat on his head, and a sword dangling from his pocket-hole. The poor man could not run smartly, for fear of deranging his dignity. He is, in fact, a mere saunterer in the streets. Louis-Philippe, we have heard, projected a police for Paris like that of the British metropolis—that is to say, a body of respectable and active street guardians; but was prevented from carrying the plan into execution in consequence of the jealous unwillingness of the French to copy anything English.

LONDON GOSSIP.

May 1850.

THE chief subject of gossip at present, singular as it may appear, is, that there is nothing to talk about; and, in fact, the season has been a dull one in several respects. A sort of expectant fermentation appears to be going on in matters of opinion, as though mind were rousing itself for a start in a new direction; but nothing especially striking displays itself. No grand invention—no notable discovery—nothing beyond what is called the 'prosy development of science.' This, in some shape or other, provokes talk; and I can only give you such incidents and items of news as have come up for discussion in our numerous hebdomadal meetings.

The note of preparation for the assemblage of the British Association in your northern capital is already heard, and it is believed that a goodly number of philosophers from the continent will be present. Some few eminent *savants* have paid us a flying visit, and shown themselves where the learned congregate. One of these is the amiable enthusiast, Dr Guggenbühl, who founded the hospital for crétins on the Abendberg, of which you once gave a lengthened notice. It appears, from a recent Report of the establishment, that its success in treating crétinism and educating the weakened intellects of the patients continues; and Guggenbühl is now engaged chiefly in a mission to promote similar establishments elsewhere. Another of our visitors was M. Quetelet, the secretary of the Royal Academy of Brussels. He had a commission from the Belgian government to examine into the electric-telegraph system of this country. Major Rawlinson, too, has come home from the East, overflowing with results of his philological researches, and has more than once edified the Society of Antiquaries with an account of his labours. The gallant decipherer of cuneiform inscriptions is a candidate for admission into the Royal Society, and will doubtless be elected.

The Horticultural Society have just published their annual Report. Are you aware that it is a standing joke against this floral corporation that they predetermine every year which shall be the three wet days—so frequently does it happen that rain falls on their show-days? and yet, according to their statement, the reverse is the case. 'For many years,' so runs the Report, 'the exhibitions at the garden were accompanied by such constant fine weather, that precautions against rain appeared needless. From 1833 to 1843, a period of eleven years, only two afternoons out of thirty-three were wet, and of these one was very slightly so. In 1845 and 1846 every day was fine; but since that time, the weather in May, June, and July had changed so much, that out of nine meetings in 1847–8–9, five had been more or less stormy. In 1849 one day only proved wet.' In consequence of the unfavourable seasons, precautions are now to be taken to insure dryness. A gravel walk, 630 feet long, and 15 feet wide, has been made in the gardens at Chiswick. Tents are to be erected on each side of this, and, if requisite, an awning will be stretched across from one to the other, so as to afford complete shelter. In 1849, 18,517 tickets were sold; a large increase over the previous year, shown also in receipts augmented by more than £200. Next to the Derby-day at Epsom there is no event that provokes so much vehicular locomotion among Londoners as the shows of the Horticultural Society.

The subject of weather, here incidentally mentioned, is one which receives much attention in most parts of Europe and the United States. The Royal Irish Academy are about to establish a system of meteorological observations throughout Ireland, in imitation and extension of the one now successfully working in this country. Mr Glaisher, of the Greenwich Observatory, to whom meteorology is much indebted for its present exactitude, considers that we have climatic cycles of about fifteen years; and expressing it by a curve, shows that we have risen to the highest point through a series of hot summers, and are now descending on the other side through a series of cold summers. The ascent and descent occupy each about five years, the remaining period being consumed in a pause at either end of the curve. To a considerable extent this theory is supported by facts, and we may look for farther developments of it; for the corps of careful observers gains daily new accessions, and the reading of an unusual number of papers on meteorology at the meetings of the Royal Society during their present session is an additional proof of its importance. *In many parts of the country also medical men invariably watch the changes of the wind as connected with disease; and not without reason, when we remember the Registrar-General's declaration, that a fall of temperature in London from 40 to 30 degrees kills 300 people!

Apropos of the Registrar: his Report for the first quarter of the present year contains statements which are commented on with gratulation in many quarters. Notwithstanding the imperfect attempts that have as yet been made towards sanitation, there is a great improvement in the public health; abundant and cheap food and plenty of work have contributed also towards this favourable result. Marriages, which declined in 1847, and scarcely rose in 1848, numbered 141,599 in the year 1849; and in the autumn quarter were 43,632, which is a higher number than has ever before been celebrated, except in the autumn quarter of 1845.

The deaths in the first quarter of 1850 were less by 21,065, and 21,414, than the deaths in the corresponding quarters of 1847 and 1848. Fewer children have been left fatherless; fewer parents have been bereaved of their children. Sickness and suffering—though perhaps not precisely in the same ratio as the mortality—have diminished; the skilled and active industry of the kingdom has been less interrupted by the illness of workmen and the incapacity of masters; the parishes have had fewer poor to relieve; insurance societies less to pay on policies; everything dependent on the duration of human life has been relieved of pressure: the minds of the people have not been irritated by hunger, fever, or discontent.

Another prime cause of amended health has been the equability of temperature and of atmospheric pressure during the past months. The high range of the barometer within the period is indeed remarkable. The births were 45,955 more than the deaths; but in the three months 46,423 emigrants left the kingdom, so that there is no real increase of population. The question of emigration has been talked about at the Statistical Society, and the returns show that from 1822 to 1831 the number of those who expatriated themselves was 291,070; from 1832 to 1841, 738,582; from 1841 to 1848, 985,953; and in the first six months of 1849, 196,973; making a total in the twenty-seven years of 2,212,578. Great as these numbers are, present indications show a tendency to increase rather than to diminish.

The Registrar starts an inquiry in the course of his Report, to which a satisfactory reply would be a fact of the most acceptable kind: it is—How are the population to be fed if the potato crop fails? To some extent, M. d'Hombre Firmas, a foreign naturalist, furnishes a reply. He recommends the young roots of the garden poppy, *Papaver somniferum*, as an agreeable and healthful esculent. He has for a long time used them in his family without inconvenience, served with butter or sugar; and in *farcandeaux* or gilet pies, or as salad. As a further proof that they may be eaten with impunity, he mentions that in the department du Gard, south of France, women range the fields, and collect roots of the coquelicot, *Papaver rhæas* (*Papaver hybridum*), and carry them by basketfuls to the towns, where they find a ready sale: these, when young, are said to be almost as good as the garden poppy. It is well known that several roots, which are noxious in the raw state, are perfectly nutritious when cooked; and perhaps some of our cultivators, whose lands are infested with poppies, will find it worth while to test the value of this statement.

There is another way, as yet untried, of producing large supplies of food; and in this our tropical colonies might well engage themselves, the rather as steam communication now renders the delivery speedy and certain. I refer to increased culture of the plantain and banana: the former is generally fried for the table in the southern states of America, where it is highly prized as an article of diet; and as regards the banana, there are few vegetable productions which equal it. A single plant of the species *Musa Cavendishii*, given by the Duke of Devonshire to Williams the missionary, and carried out to Navigators' Islands in one of Ward's glazed cases, produced the following year 'nearly 100 lbs. of fruit and thirty young plants,' and now the islands are covered

with them. The yield, in fact, is enormous. 'Humboldt states that a given quantity of land, planted with wheat, produces seventyfold, which will keep a man and his wife for a year; but it would, if planted with bananas, keep fifty persons for a like period. The same quantity of land that would yield 1000 lbs. of potatoes would produce 44,000 lbs. of bananas. This food is so inoffensive and nutritive, that in the interior of Brazil children are fed upon it from birth to maturity, and it is not known to disagree with the digestive organs.' Perhaps some of our over-sea brethren might find better account in attending to these hints than in nursing grievances about unfettered trade.

Talking of trade reminds me of a few particulars which are discussed in commercial circles. The business of plate-glass making and selling, since the removal of those obnoxious Excise duties which devoured more than 40 per cent. of the entire cost, has risen to a pitch of unexampled prosperity. Plates are now made in this country of larger dimensions, finer quality, at less cost, and with more facility, than in any other country in the world. British manufacturers, it is said, realise a profit of 20 per cent.—as much again as is gained by foreigners. The benefits resulting from the substitution of common sense for prejudice in fiscal regulations are shown in a paper read to the Statistical Society by Mr Howard. In 1847 the exports of glass exceeded those of 1846 in the article of flint-glass by 20 per cent.; common window-glass, 42 per cent.; bottles, 5 per cent.; looking-glasses, 49 per cent.; plate-glass, 110 per cent.—the quantity of the latter made weekly within the year being 70,000 feet. 'Again, in 1846, what was the quantity of plate-glass exported to all the United States of America? Not a single foot! while in 1847, when prices had been somewhat mitigated, the exports to the United States alone nearly equalled the total amount exported in 1846 to all the world!'

Another topic connected with what I have already written has also been brought before the society herein-before-mentioned, as the lawyers have it, in a paper on East India Sugar, by Lieutenant-Colonel Sykes. This sugar is produced not only from canes, but from cocoa, palm, and date-trees; of the last nearly 7,000,000 are planted in the Bengal division alone; and, including other districts, there are 880,000 acres under cane cultivation. The quantity of sugar lately obtained has been 252,000 tons annually, of which 162,000 tons are consumed in the country, the consumption per head of the population being from 2 to 8 lbs. Contrast this with the quantity imported into England in 1849—namely, 776,413,680 lbs.—about 25 lbs. per head. It appears that sugar-growing in India affords a good return: as Colonel Sykes states, 'a capital of 285 rupees, including cost of cultivation, gives a profit of 215 rupees upon 3½ acres of land.' This is at present rather an important question, for, to quote further, 'I cannot conceive that slave labour really can supersede the free labour of India, obtainable to any extent at 6s. per month, all charges included, and land to any extent at 2s. 6d. to 5s. an acre; of which land, in the sugar-growing district of Goruckpore alone, there are 1,599,586 acres, and in the whole of the north-western provinces above 10,000,000 of cultivable acres at present unappropriated.' What an opening here for enterprising capitalists—that is, provided the East India Company throw no impediments in the way! With advantages such as those above specified, one would imagine that no competition could be feared; but happily commerce knows how to take care of itself when allowed to run without leading-strings.

It seems that my gossip this time is to be of little else than produce in some form or other—I have still something to say about it. Observation has been drawn to the fact, that while the food-raising part of the population has decreased in England and Scotland, it has increased in Ireland. At the census of 1841, it was found that 1000 food-growers in Britain provided enough for themselves and 2984 persons besides; but

1000 similarly employed in Ireland grew food for not more than 511 others. In 1831 there were in England 94,883 farmers of the lowest class, not employing labourers, in a population of 13,000,000; while Ireland, with its 7,700,000 inhabitants, had 564,274 small occupiers. On the other hand, it is shown by a late statistical inquiry in Ireland, that on small farms below thirty acres, the diminution of live-stock between 1841 and 1847 is to be reckoned by hundreds of thousands. I give you the particulars from Mr G. R. Porter's Report. Speaking of pigs, he says, 'On farms not exceeding one acre, the numbers were 295,048 in 1841, and only 19,108 in 1847. On farms from one to five acres, there were 251,587 in 1841, and only 21,422 in 1847. In the next division, between five and fifteen acres, the numbers were 350,825 in 1841, and no more than 80,098 in 1847. Persons holding from fifteen to thirty acres kept in 1841, 215,340, and only 113,864 in 1847; while on farms above that size, the numbers which were 240,301 in 1841, had advanced to 282,984 in 1847. The entire deficiency of this description of stock between the two periods was 835,625, or more than 60 per cent. The diminished number of poultry was 3,378,279 upon 8,834,427, or 40 per cent., which, as in the case of the pigs, applied entirely to the smaller farms. On those above fifteen acres there was an increased number, amounting to 1,048,974, showing that the lessened number on the smaller farms was 4,427,253. The lessened number of pigs is clearly referable to the failure of the food upon which those animals are usually kept in the cabins of the peasantry; and as regards poultry, it could hardly be expected that a starving people should continue to rear things so easily convertible into food, or into that which would procure food for the owners. These facts, which are proved beyond controversy by the inquiries of the Irish government, place in a very conspicuous light the disadvantage of peasant-holdings, as compared with farms which, from their extent, require to be cultivated by persons who, possessing some capital, are not driven, on the occurrence of the first calamitous season, to measures destructive of their own future prosperity, and injurious to the public at large.'

Every question, it is often said, has two sides; and arguments are brought forward by certain parties to prove that crime, and consequently suffering, increases as small holdings diminish. Who shall decide when doctors disagree? But I must leave this topic, or you will grow weary of it; and out of a large heap of scientific and philosophical chit-chat I can only, in drawing to a close, give you a few miscellaneous items. Projects are afoot for steam communication between Galway and New York; for an electric telegraph from St Petersburg to London; for a stationary balloon over Paris, which is to sustain an electric sun for illuminating the city at night; and a scheme has been propounded for a railway of 20 feet gauge to Liverpool from London, in as direct a line as possible, with no short curves. The carriages to be 200 feet in length, divided into floors or decks as a ship, the lowest for luggage, and to comprise refreshment-rooms, pay-office, &c. The different floors would accommodate different grades of passengers. With such a construction, no stations, and consequently no clerks, would be required on the line—nothing more than a stepping-off platform. The highest fare to be twopence a mile, and the journey to occupy not more than four hours. The scheme sounds well; whether it will find supporters remains to be proved. It is proposed to plant trees on the slopes of the South-Wales Railway cuttings: you may perhaps remember my suggesting the conversion of these neglected surfaces into strawberry beds; speculators may choose between the two, remembering always that in twenty-five years the trees will pay a handsome annual profit. Besides these matters, a new kind of bath has been contrived by a working*

* It would probably be objected by one of the patrons of peasant-holdings, that Ireland, from its wretched system of tenures and leases, is not a fair instance from which to draw an inference.—Ed.

shipwright, which can be used on seas, rivers, or ponds at pleasure. It is a boat, with part of the bottom made to lower to any suitable depth by means of a windlass worked by a man who rows, while a curtained enclosure affords the necessary privacy. A paper, by Mr Higinbottom of Nottingham, has just been read at the Royal Society, which deprives sanitary reformers of a telling argument. This gentleman has clearly proved that tadpoles, when kept in the dark, *will* turn into frogs; hitherto the evidence has been, that light was essential to the process. The Royal Institution announce their Actonian prize of £100 for 1851, for an essay on the Wisdom and Beneficence of the Almighty, as regards the Physiology of Hearing, Seeing, Tasting, Smelling, &c. to be sent in before December 31 of the present year. And last, I cannot help calling your attention to some interesting remarks made by the president of the Cornwall Geological Society, Sir Charles Lemon, at their late anniversary, on the occasion of a paper having been presented to the body by a new contributor. The subject was, 'On the Fossiliferous Rocks of the Liskeard District;' and he said—'I cannot feel satisfied merely to lay it on your table without any remark on the singular character and position of its author. At present I know no more of him than that his name is Giles, and that he is in business as a shoemaker at Liskeard; but I have no doubt that the communication now opened with him will lead on to more, and that we shall find in him a most valuable coadjutor. The paper which you are about to hear read shows how much may be done even with small opportunities, and how wide is the field of science, which includes men of all classes. Mr Giles is not the first Cornishman whose thoughts have been ripened amongst the sedentary occupations of a shoemaker. But Mr Drew found the materials of his speculations at hand—in his own mind: Mr Giles, on the contrary, had to seek them far off; and it is astonishing with how much energy and discrimination he seems to have conducted his search amongst the strata of his own neighbourhood. The vigour of his mind might have done much for him, but he could not have made the use which he has made of his observations without a knowledge of books, which it is hard to conceive how he could have obtained. Altogether, we see in him qualities which are valuable to science; and I trust that we shall find him a frequent contributor to our publications and museum.'

MR EMERSON ON ENGLAND.

The following complimentary observations on England and the English were lately made by Mr Emerson in the course of a lecture delivered in New York. Our extract is from a paper called the 'New York Literary World':—

'The lecturer stated that a year and a-half ago he returned from his second visit to England, and the question now to be answered was, "Why England was England?" On landing at Liverpool, everything struck him as perfect and complete. The highest cultivation met his eye in everything. It seemed the kingdom and chosen home of common sense. The fields and gardens looked so smooth and neat, that they seemed to have been finished with the pencil rather than the plough. You rode at three times the speed, and with three times the ease, and three times the comfort, you do in this country. Over rivers and through ravines, and through tunnels three miles long, you are carried from place to place as if riding on a cannon-ball. You are surrounded with every form of convenience and luxury; your material wants are provided for in a style of artistic perfection. Masters of all kinds wait on you. Herschel and Faraday investigate for you; Stephenson made the engine that carries you; Wheatstone the telegraph at your service; Macready acts for you; the "Times" brings the gossip and news of the world for you; and Soyer cooks. In London you are surrounded with luxury and convenience, and for a few shillings paid to a private citizen, you are served as a monarch would be served, and surrounded by an air of stability and comfort which all the monarchs in the world could not buy. When

an American first puts his foot upon English ground, he seems to have come back to some long-forgotten home: the pictures of his childhood are here in reality. He sees the same ruddy, happy, portly, benignant, grandfatherly Englishmen whose portraits he studied on the tiles in the chimney-corner at home. He has got back among his friends, and finds his uncles, aunts, cousins, and grandfathers on the spot to meet him. The porter, the coachman, the guard, every one he sets his eye on, bears the plump, stalworth, upright look of those pictures.

'England has cause to boast of her choicely-cultivated population. No people on earth can compare with her in this respect. In the midst of all her social evils, all her poverty, all her crime, we see a larger number of well-developed human beings, highly-finished men, rounded, complete, consummate characters in this sphere, of which any nation might well be proud.

'If we look for the causes of this remarkable flowering forth of humanity, we must ascribe a great influence to the climate, never at any time so inclement, either by heat or cold, as to suspend labour. Every day is a working-day. There is no winter to break off the operations of industry. Another reason is, they come of a good stock. The cross between the Britons and the Saxons was a fortunate one, and after that, the northern nations (the Normans) poured their best stamina into the constitutions of the English. This blending of races has produced a physical vigour and perfection that may be looked for elsewhere in vain. The English, as a general rule, weigh more, are better proportioned, more florid, and handsomer, than any other people. You see this in all classes, from the peer to the porter. The dress of the English is emblematic of their character. In the well-dressed Englishman, he is encased in his clothing as in a shell, and looks the picture of defiance; but there is nowhere such a variety of costume. Every one dresses as he pleases, irrespective of any one else. A man washes, and shaves, and wears his hair to suit himself, and not others. He may put on a coat, or a wig, or a shawl, or a saddle, and wear it, and no one will remark upon it. He has his own way, and does not annoy others.

'The Englishman is remarkable for his pluck. He is what a gentleman described his horse to be—all mettle and bottom. They all have it—the Duke of Wellington has it—the bishops have it—the "Times" has it. The "Times" is said to be the pluckiest paper in Europe. The Englishman shows you that he means to have his rights respected. He knows just what he wants, and means to have it. He is sure to let it be known if he is not served to his mind. Still, he is not quarrelsome, and if he boasts, he has something to boast of. Among the twelve hundred men at Oxford, a duel was never heard of. This self-possession is not pugnacity. He does not wish to injure others; he is thinking only of himself.

'With such a sturdy population, England is not likely to break up; though I am aware, when speaking of this subject, it is customary to speak of England as in its decline. Such is not the case. She now contains the essential elements of growth. London will soon fill Middlesex. The British Museum is not yet arranged—its catalogue of books reaches only through the letter A; the National Gallery is too small to hold the pictures; the Nelson Monument is just finished; and the new Houses of Parliament are verging to completion, with their Victoria Tower, which is to shoot up 400 feet into the sky. The London University is adding to its size with a rapidity similar to our own growing colleges in the West, and towns are starting up as rapidly as Brooklyn. Birkenhead was alluded to, though lately it had received a check; and when Mr Emerson was in England, the country was in a ferment, and in some cases seen under unfavourable circumstances. Mr Emerson then alluded to many of the wonders he saw. But it would require some art akin to photography to give every illustration the lecturer gave. Every Englishman, he said, carried about him an atmosphere of his own, and they hence were said to be a reserved people, and he gave an amusing quotation from a French author. You were as if you were not, unless introduced, and even then the man looked coldly enough, though he was thinking all the while how he should serve you best; but when his door was opened, you were at home. He, the lecturer, had never met with such attention. He said it was an old opinion that the English did not like foreigners, and quoted old authors in proof; but we think a prejudice of this kind is fast wearing away in England. Nicholas of Russia, the

greatest despot in Europe, was some months in England, and was not even hissed. And are not the Pole and the negro, ay, and the Hungarian and the Frenchman, received with open arms when their country drives them out? Ten millions were given freely to Ireland; nor did they ever expel workmen, like the French at the late Revolution. Does this show dislike to foreigners? The lecturer said the presence of a superior class gives a tone to their general manners, every trifle being clothed with importance. Whatever is done, must be done in the best way (proverbially the cheapest in any case). The English character thus gains an admirable balance of qualities, resembling, in its keenness and vigour, the best-tempered steel. The fabulous St George was not the true emblem of the national character. He saw it rather in the lawgiver, scholar, poet, mechanic, monarch, Alfred; in later times, in Cromwell; and in one not so well known, William of Wykeham, the builder of Windsor Castle, a bishop of Winchester, a putter down of abuses in his time in his own diocese. He founded a school at Winchester for seventy scholars for ever; he endowed a college at Oxford for seventy fellows for ever; and he established a house in the neighbourhood of Winchester to provide a measure of beer and a sufficiency of bread to every one who asked it for ever; and when Mr Emerson was in England, he was curious to test this good man's credit, and he knocked at the door, preferred his request, and received his measure of beer and his quantum of bread, though its donor had been dead seven hundred years!

If the foregoing be a correct abstract, it would seem that the lecturer touched but lightly on what we consider to be one of the most striking characteristics of the English—namely, their singular liberality as respects strangers who settle in their country. They are utterly indifferent who their neighbours may be—Scotch, Irish, French, Christian, Turk, or Jew, it is all the same; the only thing they look to is, whether a man pays his way, and conducts himself properly. The charity, public and private, extended by the English towards strangers is in itself remarkable. Nor does this feeling of kindness soon cool—so much the reverse, that it becomes a national fault. At this moment the finances of the country are actually charged with charitable disbursements towards the descendants of French families exiled in consequence of the Revocation of the Edict of Nantes!

RIDICULE.

I know of no principle which it is of more importance to fix in the minds of young people than that of the most determined resistance to the encroachments of ridicule. Give up to the world, and to the ridicule with which the world enforces its dominion, every trifling question of manner and appearance: it is to toss courage and firmness to the winds to combat with the mass upon such subjects as these. But learn, from the earliest days, to insure your principles against the perils of ridicule: you can no more exercise your reason, if you live in the constant dread of laughter, than you can enjoy your life, if you are in the constant terror of death. If you think it right to differ from the times, and to make a stand for any valuable point of morals, do it, however rustic, however antiquated, however pedantic it may appear—do it, not for insolence, but *seriously and grandly*—as a man who wore a soul of his own in his bosom, and did not wait till it was breathed into him by the breath of fashion. Let men call you mean, if you know you are just; hypocritical, if you are honestly religious; pusillanimous, if you feel that you are firm: resistance soon converts unprincipled wit into sincere respect; and no after-time can tear from you those feelings which every man carries within him who has made a noble and successful exertion in a virtuous cause.—*Rev. Sydney Smith.*

TRUE CHIVALRY.

No more in knightly tournament
May lover proudly bear
The silken scarf or emblem flower
Bestowed by lady fair.
No longer must the fatal lance
Her spotless honour prove,
Nor high hearts stilled the offering be
Of chivalry to love.

No more beyond the rolling deep
Must true love prove its faith,
By bearing in its sacred name
A talisman of death.
No more must glory's wreath be won
Where death and danger meet,
Nor sword incarnardined in gore
Be laid at beauty's feet.

But in life's bloodless battle-field
To take a nobler stand,
To strive for victory among
The wisest of our land—
By prowess of the mind and heart
To gain a loftier place—
Be these the guerdon of his truth
Who seeks a lady's grace.

To *self* be not your gauntlets flung,
Ye heroes of the list!
Nor till your foe be quite o'erthrown
The gallant strife desist.
A field more dread and glorious
Ne'er chivalry could meet,
And smiles of spirit loveliness
Your victory will greet.

C. T.

SOCIALIST SUCCESS IN FRANCE AND THE PROSPERITY OF THE WORKING-CLASSES.

One of the most striking proofs of the effects of the Socialist success is found in the condition of the savings' banks of Paris. In all the weeks of January and February confidence prevailed; the artisans and shopkeepers were tolerably well employed—they could save something, and, relying on the government, they invested their savings. In the second week in March the deposits fell to nearly half the amount of the first week in February, and in the third week of March they declined nearly one-third more. As there was a prospect of the success of those who claim for themselves exclusively the character of the workman's friends, the workman's wages dwindled away, and his savings were lessened. When the workman's friends actually succeeded, those effects were augmented, work was almost suspended, and saving almost ceased—adding to the many proofs afforded by every page of modern history, that none suffer so much by political disturbances and revolutions as those on whose behalf they are said to be made. The usual pretext for them is the distress of the labourers, and in all cases they increase that distress. They suspend productive industry; and if the capitalist lose his profit, and the landowner his rent, the labourer loses his wages, and becomes a pauper or starves. He may, by the suspension of his industry, cease to benefit others, but he infallibly ruins himself. The politicians who claim to be the friends of workmen, and are continually planning political changes to serve them, are their worst enemies.—*Economist.*

The present number of the Journal completes the thirteenth volume (new series), for which a title-page and index have been prepared, and may be had of the publishers and their agents. *

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 340. NEW SERIES.

SATURDAY, JULY 6, 1850.

PRICE 1½d.

A HEROINE OF BURNS.

THE peasant poet of Scotland had many loves; but amongst them all there is none which has held forth such images of purity and tenderness as his attachment to one on whom he has himself conferred the poetical appellation of Highland Mary. The love of the poet for this young woman was broken off by the event of her sudden death. She also appears, from his own descriptions, to have been a singularly gentle and affectionate creature. These circumstances, embalmed in the heart-touching strains of the poet himself, have excited regarding her an interest such as has rarely indeed befallen a maiden of her humble rank.

All that has hitherto been known or understood regarding Highland Mary may be expressed in a few sentences. Her name was Mary Campbell, and she had been a servant at Coilsfield House, in Burns's neighbourhood in Ayrshire, and likewise with his friend Mr Gavin Hamilton of Mauchline. Burns himself places on record that she was 'a warm-hearted, charming young creature as ever blessed a man with generous love.' He adds—'After a pretty long tract of the most ardent reciprocal attachment, we met by appointment, on the second Sunday of May, in a sequestered spot by the banks of the Ayr, where we spent the day in taking a farewell, before she should embark for the West Highlands, to arrange matters among her friends for our projected change of life. At the close of the autumn following she crossed the sea to meet me at Greenock, where she had scarce landed, when she was seized with a malignant fever, which hurried my dear girl to the grave in a few days, before I could even hear of her illness.' This is the bulk of her story. Mr Cromek, who published 'Reliques of Burns,' had learned some more minute particulars. 'The adieu,' he says, 'was performed with all those simple and striking ceremonials which rustic sentiment has devised to prolong tender emotions and inspire awe. The lovers stood on each side of a small purling brook; they laved their hands in the stream, and holding a Bible between them, pronounced their vows to be faithful to each other. They parted—never to meet again.'

There are, however, no memorials of this parting comparable to the verses in which Burns has recorded it. For example:—

* Wi' mony a vow and locked embrace,
Our parting was fu' tender;
And pledging aft to meet again,
We tore oursels asunder.
But, oh, fell death's untimely frost
That nipt my flower sae early!
Now green's the sod and cauld the clay
That wraps my Highland Mary.
Oh pale, pale now those rosy lips
I aft hae kiss'd sae fondly!

And closed for aye the sparkling glance
That dwelt on me sae kindly;
And mouldering now in silent dust
That heart that loed me dearly!
But still within my bosom's core
Shall live my Highland Mary!

Or the still more affecting verses, 'To Mary in Heaven,' which he composed several years after the death of their subject, under remarkable circumstances. Burns was now a farmer on the banks of the Nith—a husband, and the father of several children. He had passed through scenes of gay and elegant life in Edinburgh, and indulged in many passionate, though temporary attachments. Still, under all circumstances, the image of the simple Highland girl had remained deep in his heart, and he could never recall her melancholy fate without a pang. One harvest evening in the year 1789, after he had been busy all day with his reapers, his wife observed him grow very sad about something. He had remembered that it was the anniversary of the death of Mary. He 'at length wandered out into the barnyard, to which his wife, in her anxiety for his health, followed him, intreating him in vain to observe that the frost had set in, and to return to the fireside. On being again and again requested to do so, he always promised compliance—but still remained where he was, striding up and down slowly, and contemplating the sky, which was singularly clear and starry. At last Mrs Burns found him stretched on a mass of straw, with his eyes fixed on a beautiful planet "that shone like another moon," and prevailed on him to come in. He immediately, on entering the house, called for his desk, and wrote exactly as they now stand, with all the ease of one copying from memory, the sublime and pathetic verses:—

* Thou lingering star, with lessening ray,
That lov'st to greet the early morn,
Again thou usher'st in the day
My Mary from my soul was torn.
Oh, Mary! dear departed shade!
Where is thy place of blissful rest?
See'st thou thy lover lowly laid?
Hear'st thou the groans that rend his breast?
That sacred hour can I forget—
Can I forget the hallowed grove,
Where by the winding Ayr we met,
To live one day of parting love?
Eternity will not efface
Those records dear of transports past:
Thy image at our last embrace,
Ah! little thought we 'twas our last!
Ayr, gurgling, kissed his pebbled shore,
O'erhung with wild woods, thick'ning green;
The fragrant birch, and hawthorn hoar,
Twined am'rous round the raptured scene;

* Lockhart's Life of Burns.

The flowers sprang wanton to be prest,
The birds sang love on every spray—
Till too, too soon, the glowing west
Proclaimed the speed of winged day.

Still o'er these scenes my memory wakes,
And fondly broods with miser care!
Time but th' impression stronger makes,
As streams their channels deeper wear.
My Mary, dear departed shade!
Where is thy place of blissful rest?
See'st thou thy lover lowly laid?
Hear'st thou the groans that rend his breast?

It was impossible for any one to be the theme of such verses without becoming an object of profound interest to all who are capable of appreciating them. Accordingly, it is not surprising that, in later times particularly, everything which could be readily learned regarding Highland Mary has been brought before the public. It, after all, amounted to little; and that little, apart from the love of Burns, was commonplace enough. It was learned, for instance, that her father was a sailor belonging to a revenue cutter stationed at Campbeltown—that her relations latterly lived at Greenock, where her mother died in poverty in 1828—and, strange to say, that her friends had entertained so strong a prejudice against her lover, as to burn his letters, and enjoin silence about his name. One memorial, however, of the love of Burns and Mary made its appearance not long after the mother's death, and was heard of with a thrill of interest all over Scotland. This was the identical Bible which the poet had given to his mistress on the day of their parting. Passing to Canada in the possession of a collateral relative of Mary, it was there redeemed for a large sum by some enthusiastic Scotsmen, and sent home to be deposited in the poet's monument at Ayr. It was a plain and somewhat worn copy in two volumes, containing the poet's name on a blank leaf of either, together with two texts marking the intense feeling of that memorable second Sunday of May—'And ye shall not swear by my name falsely—I am the Lord.'—*Levit. xix. 12.* 'Thou shalt not forswear thyself, but shalt perform unto the Lord thine oaths.'—*Matt. v. 33.* This relic, it is needless to say, has been preserved with great care, and is, during the travelling season, viewed with deep emotion by thousands.

It was strange, all this time, that no biographer of Burns had undertaken to assign a date to the affair of Mary Campbell. Mr Cromek had called her 'the first object of the youthful poet's love;' and Professor Wilson, in his beautiful, generous 'Essay on the Genius and Character of Burns,' also spoke of the attachment as occurring at an early period of the poet's life. Burns himself, in sending a song written about her to Mr Thomson, had said, 'In my *very early years*, when I was thinking of going to the West Indies, I took the following farewell of a dear girl;' the song was one beginning—

'Will ye go to the Indies, my Mary,
And leave auld Scotia's shore?
Will ye go to the Indies, my Mary,
Across the Atlantic's roar?'

Language, by the by, which does not look very like a farewell to a sweetheart. He had said of still another song on the same person—one entitled 'The Highland Lassie'—'This was a composition of mine in my *early life, before I was known at all in the world.*' These expressions, with the very character of the whole affair—invested, it seemed to be, with a purity bespeaking the unsullied morn of life—led all alike, writers and readers, to rest quietly in the assumption that Burns had courted Mary at some early period of his career, when contemplating a voyage to the West Indies to push his fortune there. Yet no notice of any such design could be pointed to in his life, or any letter or other document connected with him, anterior to the summer of 1786, when matters had assumed such a posture between him and Jean Armour, his future wife, that he did arrange for such a voyage, from which, indeed, he was only with-

held by the success of his poems, published at that crisis.

The mystery thus attached to the story of Mary at length attracted the attention of a gentleman whose name had hitherto been unconnected with the history and works of the Ayrshire bard. It occurred to Mr William Douglas of Edinburgh that the idea of its being a juvenile attachment of Burns had hitherto been too easily acquiesced in. The Bible bore on its title-page the date 1782, when Burns was in his twenty-fourth year. It must have been later than that time. After the poet's name was inscribed that of his residence, 'Moss-giel.' He did not live there till the spring of 1784: it must have also been later than that time, more particularly as Burns was most unlikely to be thinking of a voyage to the West Indies when just entering upon a new farm, the fortunes of which were all to be proved. Mr Douglas was less forcible in his objections to 1785; neither could he be considered as settling the event as not earlier than the spring of 1786, on the mere showing that Burns up to that time was accustomed to spell his name 'Burness,' whereas it is 'Burns' on the Bible inscriptions—because the spelling of names is in some degree a matter of caprice, and it is certain that at least other people wrote his name 'Burns' before 1786—so, indeed, it is entered in the register of his birth. It was nevertheless remarkable that we should be forced past 1784, when Burns could not be considered as very youthful, and brought into a period of his life of which the details are comparatively well known, there being amongst these no recognised or authoritative trace of Mary. In 1785 Burns was devotedly attached to Jean Armour. It was a year of great and brilliant literary exertion, being that in which the bulk of his poems was composed. There is no room here for the contemplated voyage to the West Indies, or the love of Highland Mary. In 1786, as has been mentioned, Burns was brought by evil fortune to prepare for such a voyage; but then his other circumstances were such as, at first sight, to preclude such an attachment. With Jean he had avowed a private marriage in spring—not a moment too early, one would have said, for the young lady's peace; though, strange to say, her father had forced her to disclaim Burns as her husband, infinitely to the grief and resentment of the unhappy poet. Was it now that Burns loved Mary Campbell? It could not be at any later time—that was quite clear; for Burns had no need to think of exile from his native land after October 1786, when his success as a poet was decided. Much reason was shown why it could not be earlier. Not without some hesitation, Mr Douglas became convinced that, think what we might of it, it was in the May of 1786, little more than a month after he had been thrown off by Jean Armour, that he took that tender farewell of the simple Highland Lassie on the banks of the Ayr, to know her thenceforth no more as a living woman, but as an image of beauty, and tenderness, and truth, resting in his bosom for ever.

On his bringing this theory before a learned society in Edinburgh, the ingenuity and acuteness of his arguments were acknowledged; and many admitted that he had made it all but certain that 1786 was the true date. On that occasion a member said that, if such should prove to be the case, as seemed likely, he did not see how it should greatly affect our feelings regarding either Burns or the story of this attachment. The vacillating pulses of the heart are a great mystery. Burns, we know well, had been rendered half frantic in consequence of his repudiation by Jean. At such a crisis his soul would rush to a compensation in the affections of some more devoted fair one, especially if, as was not unlikely, he had felt favourably disposed towards that other person before. A month or six weeks was a long time in the almanac of the heart, at least a Solway-tided heart like that of Burns. It often happens that, under a disappointment or rejection from one woman, a man will abruptly pay addresses to and marry another. Some other persons spoke on the occa-

sion, but generally expressed themselves as inclined to regard the point as still greatly doubtful.

In a new biography of Burns which Mr Robert Chambers is preparing, upon a plan which will include his poems and letters, and involve greater accuracy and greater detail than any preceding one, it has been necessary of course to treat this question, and, if possible, to settle it. For this purpose the author made some personal investigations, which resulted in bringing such powerful documentary evidence in favour of Mr Douglas's theory, that he has felt himself entitled to introduce the affair of Mary as occurring in 1786. The present paper may best be completed by an extract from the work : *

"Mary, we are to presume from the narration of the poet, had proceeded immediately after their parting to Campbeltown, where her parents then resided. She had spent the summer there; but whether she had taken any steps in arranging matters for a union with Burns seems doubtful, as it is the report of a very intelligent member of the family that her mother used to speak as if she had never been consulted on the subject. Another report in the family is, that while Mary resided with her parents, they became alarmed at her receiving a letter weekly from one whom they heard spoken of as "a strange character," and "a great scoffer at women." Mary met the account of her lover's character with a smile, and thereafter was allowed to continue receiving his letters.†

"A sister of Mary's mother was the wife of one Peter Macpherson, a ship-carpenter at Greenock. It being determined that her younger brother Robert should be entered with Macpherson as an apprentice, her father came to Greenock to make the proper arrangements, and Mary accompanied him. For this step on Mary's part we can well surmise further and private reasons of her own, since Burns has expressly said that she crossed the sea [the Firth of Clyde] to meet him. There was what is called a *brothering-feast* at Macpherson's on Robert Campbell being admitted to the craft; and it is the distinct recollection of a daughter of Macpherson still living that Mary gave her assistance in serving the company. Next morning, according to the same person's recollection, the boy Robert was so indisposed as to be unable to go to his work. When Macpherson came home to breakfast, he asked what had detained him from the yard, and was told that the young man was very poorly. Mary jocularly observed that he had probably taken a little too much after supper last night; and Macpherson, in a similar spirit of badinage, said, "Oh, then, it is just as well, in case of the worst, that I have agreed to purchase that lair in the kirkyard;" referring to a place of sepulture which he had just secured for his family—a very important matter in Greenock, as there was then no resting-place for the remains of those who did not possess such property, except the corner assigned to strangers and paupers, or a grave obtained by favour from a friend.

"The young man's illness proved more serious than was at first supposed, and Mary attended him with great tenderness and assiduity. In a few days Robert began to recover, but at the same time Mary drooped, and became seriously unwell. Her friends believed and said that she suffered from the cast of an evil eye, and recommended her father to go to a cross burn—that is, a place where two burns meet—and select seven smooth stones from the channel, boil them with new milk for a certain time, and then give her the milk to drink. It must be remembered that these were Highland

people, and that the Highlanders are to this day full of superstitious notions. The drink was duly prepared, as had been recommended, and given to Mary; but her illness was soon declared to be fever, of a malignant species then prevalent in the town, and in a few days the poor girl died. She was buried in the *lair* which her uncle had so recently bought, being the first of the family who was placed in it.

"Such are the particulars derived from Macpherson's daughter, and from a male relative of the family* who has often conversed on the subject with Mary's mother. There seems to be no good reason for doubting them, or any of them. The only point in which the story is defective is the date, a matter regarding which the memory is apt to be less faithful than with respect to events. There is, unluckily, no register of deaths or funerals for this period in Greenock. In my efforts, by other means, to ascertain the date of Mary's death, I met for some time with little success. On a visit to the town for the purpose of making investigations, my first attention was given to Mary's grave. It is in the burial-ground of the West Church of Greenock, the original and principal parish of the town—a melancholy and half-deserted precinct, so close to the Firth, that a stone could be thrown into it from the passing steamers. In a central situation are two flat stones, recording the ancestors of the illustrious James Watt. Near the west end is the little plot which had belonged to Peter Macpherson, the ship-carpenter. Shading it from the setting sun is a tall, elegant structure which a few admirers of Burns have erected for the commemoration of her whom the poet loved. It contains a sculpture representing the parting of the lovers, while a ship in another compartment hints a different part of the story. At the foot of this lofty structure nestles the original little *headstone* of Macpherson. In its semilunar upper compartment are carved the tools of a carpenter, with the date 1760. Underneath, on the square body of the stone, is the legend—"This Burying-Place belongs to Peter Macpherson, ship-carpenter in Greenock, and Mary Campbell his spouse, and their children. 1787." There was an uncertainty here. The stone might have been erected in 1760 by some member of Macpherson's family, from whom he had inherited it; and, notwithstanding the legend and second date, Mary might have been buried there at any time from 1760 downward. I observed, however, that the legend and second date are inscribed upon a surface half an inch or so *inward* from that on which the tools were carved, as if an earlier inscription had been obliterated—implying that the stone had undergone a renovation in 1787. If that was to be regarded as a doing of Macpherson when he became possessed of the lair, the tendency of the evidence might be said to be in favour of a late rather than an early date for the death of Mary. Still, the matter was left at an unsatisfactory point.

"At this stage of the inquiry it was brought to mind that there was a Register of Lairs, in which it might be hoped that the date of Macpherson's purchase was entered. A wretched tattered old volume was found buried in a mass of similar rubbish, in the possession of Mr Teulon, superintendent of the burying-grounds of Greenock, by whose obliging assistance, with no small difficulty, an entry was at length found, to the following effect :—

" 1760	feet
" Jan ^y 14. Duncan Robertson, carpenter	6 £0 . 9 . 0
" 1786	
" Oct. 12. This lair is this day transferred to Peter Macpherson, ship-carpenter in Greenock."	

There could not of course remain the slightest doubt that the ground which contains the ashes of Highland Mary was bought by her uncle at the very time when Robert Burns designed to sail from Greenock for the West Indies. Macpherson, exactly as I had conjectured, had succeeded to a stone, which he had renovated, preserving

* Mr R. Chambers takes this opportunity of stating that he will receive with thankfulness any papers written by or respecting Burns. He pledges himself to take the greatest care of any which may be forwarded to him, and to return them carefully. In a subject so obscure and confused, even a date may sometimes be of consequence. He would therefore intreat that persons possessing documents, and willing to intrust him with them, will not be too ready to think them unlikely to be useful.

† Letter of John Kerr, Esq. of Glasgow, in the 'Scots Times' newspaper, Nov. 7, 1829.

* Mr J. C. Douglas, clothier, Greenock.

only the sculpture of his predecessor's emblems of trade, because these were equally suitable for himself. Unless, then, we are to reject the family story entirely, and suppose it possible that Mary was buried here while Duncan Robertson possessed the ground, which, I am informed, the customs of sepulture in Greenock render to the last degree improbable, we must admit that her death took place in the latter part of 1786—consequently after her poet-lover had broken off his match with Jean Armour; in short, the piteous tale of the Highland Lassie comes in as one of several episodes that chequered the main attachment of Burns's life—that which terminated in making him at length a husband.

Mary's parents and other near relations, who afterwards settled in Greenock, were of such a grade of mind and strain of sentiment as to shrink for many years from all acknowledgment of Burns as her lover. It cannot be surprising that a man who could think of administering a decoction of pebbles as a cure for his daughter's illness, was narrow-spirited enough to burn the letters of a great poet, and forbid his name to be mentioned in the family. The mother, who was a good, kind-hearted creature, was more relenting. She learned to sing the song of the "Highland Lassie" to her grandchildren. On being asked by her grand-nephew, Mr J. C. Douglas, if she thought that Mary would have married Burns, she said that she could not tell what might have happened if Mary had survived; but she did not think her sweet lassie could have ever been happy with so wild and profane a genius as Burns; yet she would immediately add, that he was "a real warm-hearted chield"—for such was the impression he had made upon her when he had subsequently paid her a visit. The old woman always spoke of Mary, who was the eldest of her eight children, as a paragon of gentleness and amiability. Her sincerity was a quality which, above all others, the mother fondly dwelt on. There is, indeed, all desirable reason to believe that Mary was of a character to have graced, if not even rectified, a companion spirit such as Burns—who, in subsequent years, might well have imagined that with her he could have been something different from what he was.

"What conquest o'er each erring thought
Of that fierce realm had Agnes wrought!
I had not wandered wild and wide
With such an angel for my guide;
Nor heaven nor earth could then reprove me,
If she had lived, and lived to love me."

'We have now to turn to Mossiel, where the poet was living in an unsettled state, looking forward to the Jamaica voyage, but still hopeful that a ram would be caught in the thicket—that is, an Excise situation prove attainable—so as to save him from exile. It was a late harvest that year. According to Burns's own description—

"Autumn mourns her ripening corn
By winter's early ravage torn."

Mrs Begg * remembers that, after the harvest-work was over, and she had, as usual, taken to the big wheel, in which either her mother or one of her sisters was assisting her—Robert and Gilbert being also present—a letter for the former was handed in. He went to the window to open and read it, and she was struck by the look of agony which was the consequence. He went out without uttering a syllable. The family learned nothing of the facts of the case till after the publication of some of the songs written upon Mary; and even then, they became aware of this strange passage in their brother's history only as something too sacred for discussion or remark. So deep was this impression upon the mind of Mrs Begg, that she never spoke of the story to her daughters, till Mr Douglas's investigation broke through her reserve, and she added her testimony as to the true year, and related the above particulars.

* Burns's reasons for maintaining a mystery on the sub-

* The surviving sister of Burns.

ject, as he has evidently done, can only be matter of conjecture. He might have some sense of remorse about this simple girl—he might feel some little shame on account of her humble position in life—he might dread the world's knowing that, after the affair of Jean Armour, in the midst of such calamitous circumstances, and facing a long exile in the West Indies, he had been so madly imprudent as to engage a poor girl to join him in wedlock, whether to go with him, or to wait for his return. Some remarks of Dr Currie, in which this affair is touched upon, and which significantly occur immediately after the recital of the rencontre with the Bonny Lass of Ballochmyle [an affair of summer 1786], are here worthy of attention, as helping to verify a narration otherwise apt to appear a modern myth. "The sensibility," says he, "of our bard's temper, and the force of his imagination, exposed him in a particular manner to the impressions of beauty; and these qualities, united to his impassioned eloquence, gave him in turn a powerful influence over the female heart. The banks of the Ayr formed the scene of youthful passions of a still tenderer nature, the history of which it would be improper to reveal, were it even in our power; and the traces of which will soon be discoverable only in those strains of nature and sensibility to which they gave birth. The song entitled 'Highland Mary' is known to relate to one of these attachments. 'It was written,' says our bard, 'on one of the most interesting passages of my youthful days.' The object of this passion died early in life, and the impression left on the mind of Burns seems to have been deep and lasting." It seems not unlikely that Currie had got a hint of the affair from Gilbert Burns, but with injunctions to touch on it lightly.

CHEMISTRY OF CREATION.

CHEMISTRY is the science *par excellence* of experiment. Other sciences investigate the laws of nature by means of inquiry and induction; but the chemist places himself in the position of nature herself, and strives to obtain the knowledge he seeks by imitating her processes. His workshop is a copy in little of the great laboratory of creation, and we find there the human insect, whose life is but a span, dealing boldly with the elements of the universe, and turning by his art the wildest fictions of romance into every-day facts. The other sciences expand the mind and enlarge the knowledge; but chemistry, in addition, devotes herself to the physical service of the human race. She heals their diseases, indicates and prepares their food, adorns their garments, warms, lights, and ventilates their dwellings, fertilises their fields, wafts them with the speed of the wind along the land and sea, flashes their distant messages, like lightning, through the air and underneath the waters; and deserting not her votary in the day of calamity, neutralises his pain, dispels his terror, and soothes him in death.

The chemistry of creation, from which is derived the knowledge that governs the processes of practical chemistry, is not only the most useful, but the most elevating of studies; and we have accordingly been careful from time to time to present to our readers a popular glimpse of the progress of speculation and discovery connected therewith. We are now called to the agreeable task of noticing a very clever *resumé* of the whole subject, by one of those chemists whose peculiar province is the healing art, a rising young surgeon in London.* The volume commences with a slight sketch of the history of chemistry, and then proceeds to treat separately of the chemistry of the earth, the air, and the ocean. All this is done with so little technicality of language, that the book, although in reality of considerable scientific pretensions, and embracing notices of the most recent

* The Chemistry of Creation: being an Outline of the Chemistry of the Earth, the Air, the Ocean. By Robert Ellis, M.R.C.S., &c. London: Printed for the Society for Promoting Christian Knowledge. 1850.

discoveries, may be used as a rudimentary work by common readers. We consider the publication, therefore, as meriting general attention, although it will be found more especially useful by those whose means or leisure does not admit of a regular course of study. To enable such readers to form an idea of the contents of the volume, it will suffice to notice a few points in each of the three departments of the volume. These, however, we must premise, will probably not be the salient points; for we must be guided in our choice by the novelty the subjects may have in our own pages.

In Part I. there is an interesting account of the natural process by which the substance of rocks is dissolved by the agency of air or water; and Mr Ellis proceeds to describe the results occurring on a large scale, and observable in a very few years. In one place, only six years after a path had been blasted through solid granite, those apparently indestructible walls were so much decomposed by the influence of the carbonic acid in the atmosphere, 'that the solid rock, to the depth of three inches, was in a crumbling condition.' In such districts, when a traveller steps upon what seems to be a piece of granite in its normal state, it falls to powder. In the quarries at Dartmoor, the rock is found to be more or less decomposed to the depth of fifty or sixty feet; and the walls of the prison, unadvisedly built of blocks taken from that surface granite, have 'become a spongy mass, absorbing moisture continually, rusting the iron bars, and rendering the cells so damp, that they can only be used by covering the walls within and without with Roman cement or tiles.' The granite used in the Nelson Monument in London is from the same locality; but being quarried, according to the admonitions of chemistry, from a depth beyond the influence of atmospheric decomposition, the column will in all probability be much more lasting than the prison. 'All our earthenware,' says Mr Ellis, 'from the commonest jug to the house-tile and flower-pot, is in like manner produced from a material which is formed by the influence of water, air, and carbonic acid, upon rocks of various kinds, but all more or less agreeing in composition as to their chief ingredients. In certain districts in Devonshire and Cornwall there exist rocks of a fine white granite, which exhibit the decomposing effect of these agents in a remarkable manner.* On the surface, and for a considerable depth into their substance, the rock is altered to a soft matter resembling mortar. This is collected and washed; the water which comes from the washing of it being of the colour of milk, in consequence of its containing a quantity of white earthy substance suspended in it, is conducted into tanks, and in its passage through several reservoirs, deposits this white earthy matter at the bottom. The tanks are then emptied of water, and the white deposit being removed and dried in the open air, and subsequently more completely by a drying-stove, constitutes the beautifully fine white clay employed in the manufacture of porcelain. Not less than about 10,000 tons of this white clay, thus derived from the decomposed material of the granite rock, is exported annually for the use of the potteries. Its chemical composition—the composition in great part of our china cups and ornamental ware—is alumina (the basis of common alum), silicic acid, a little alkali and lime, and, in the unburnt state, a large proportion of water, together with a variable amount of sand. The Chinese, as well as ourselves, employ the same material for the manufacture of their exquisite porcelain.'

The remarkable phenomenon of the geysers in Iceland is traced to a similar decomposition. The geysers, our readers know, are immense boiling fountains contained in lofty basins supplied from the common hot springs below by a natural tube; and the grand agent in producing them is the decomposition effected in a rock called palagonite by hot water, carbonic acid, and

sulphuretted hydrogen. The explanation is as follows:—'The water of these boiling springs contains a dissolved hydrate of silica, which, on its evaporation, is deposited around the mouth of the spring, on the margin projecting beyond the level of the water. Of course, in the basin of the spring, and below its surface, no evaporation takes place, and therefore no incrustation can occur. Imagine, then, this process of incrustation around the edge of the spring to continue for years, the natural result would be, that the margin would become higher and higher, forming a rocky tube of siliceous matter. As the margin rises, the water of course rises also, being always a little below the former. The consequence is, that the spring, by this continued process of deposition, increases in height, until, reaching a certain altitude, it becomes converted into a regular geyser. Surrounding the tube formed in this simple manner is a hillock of siliceous matter, formed by the overflowing of the water of the spring. These tubes are fed with water from the mountains above them, which becomes heated in the volcanic subterranean channels along which it is conducted. This high temperature converts a part of it into vapour, and the result is, that the water elevated by its expansive force, foaming, and hissing, rises up through the tube which the incrusting waters have reared, and rushes boiling out of the mouth of the spring.'

In Part II., relating to the air, there is a passing notice of the question as to the limits of the atmosphere. It is now recognised, though not proved, that the air does not extend more than about 50 miles into the regions of space. Astronomy discountenances the idea of illimitable extent, by showing that there are only two other planets in our system which appear to be provided with an aerial atmosphere; and chemistry applies the atomic theory to prove that there is no such thing as infinite divisibility of matter. 'It is held, for instance, as certain that we cannot subdivide matter beyond a certain point; at this point, its particles are called atoms, and these atoms have a certain size and weight. Applying the same reasoning to the air, it is considered that there is a point at which it cannot be expanded further; and this point is supposed to be the true limit of the air.'

The air has recently been supposed to be subject to a phenomenon called atmospheric waves, which is only now in process of examination. These waves—discovered by the barometer—do not resemble the undulations of the sea, but pervade the whole depth of the atmosphere, and occupy several days in their duration. The most remarkable has been observed for some years past to occur about the middle of November, when it lasts, from the commencement of its rise to its subsidence, about sixteen days. Sometimes it begins and closes with a gale of wind. This subject is so obscure, that the phenomenon called the Indian Summer can as yet be only connected with it as a coincidence. 'In America, at this period, generally from the 12th to the 17th of November, after a foretaste of the severities of winter has been felt, a sudden change of temperature takes place, a delicious warmth is felt, the sky is without a cloud, not a breath of air is stirring, and the whole atmosphere is filled with a glowing transparent haze. In three days this is all gone, and winter comes on quickly afterwards. In Switzerland, the same phenomenon has been remarked from time immemorial. About the 11th of this month, the fête of St Martin is celebrated, and the inhabitants call the delightful four or five days' return of summer weather at that time, after, to all appearance, the summer has ended, *l'Eté de St Martin*, or St Martin's Summer. Whether these interesting facts are more than mere coincidences, whether the great wave has anything to do with them or not, it is not at present possible to ascertain.'

Rain acts as a great sanitary agent, by washing down the impurities contracted by the atmosphere from the smoke and exhalations of the more crowded haunts of human beings. These are so far injurious to our

* At Shaw, a few miles from Plymouth, the surface for hundreds of acres consists of decomposed felspar, in a state resembling flour. When purified and baked it forms a fine porcelain.

respiration, but they are much more so to that of the plants, which never enjoy health in large towns. Instead of complaining of the rain as we do, in this variable climate, we should consider it a blessing: but let us follow the beneficent fluid in its descent into the earth, and we shall find further cause of thankfulness. 'Whatever soluble matter is met with by the rain at the surface of the soil, it carries with it as it sinks downward into the earth. All the unpleasant results of organic decay on the surface that are soluble are conveyed downwards by it, and the water, thus polluted, sinks to the underground reservoirs, from whence man draws his supply of this indispensable fluid. What results might we not, therefore, anticipate on an examination of water drawn from such receptacles; and what a polluted condition might we not expect the soil to be in, which forms the filter through which this decaying organic matter penetrates! Yet, when we come to examine into these matters, "we do not find them," in the words of Dr Smith, "present that exaggerated character which we might suppose." It is surprising, on the contrary, to find that organic matters, properly so called, are scarcely, in reality, found in these wells; and, more singular still, the wells nearest to a source of organic matter frequently contain less than others farther removed from the apparent probability of contamination.' The chemical explanation of this seeming paradox is, that the filthy nitrogenous matters carried down by the rain into the soil, combining with the oxygen they meet, result in nitrates which are comparatively harmless; and in the same way the carbon of the soil is supposed to be oxidised, so as to form the carbonic acid gas which gives its sparkle and exhilaration to spring water.

A proposal has been made by Mr Rowell to bring down rain, when wanted, by means of electrical conductors sent up towards the clouds in balloons. He tells us that on several occasions, when his own electrical kite came immediately under a light fleecy cloud, after a free current of sparks had passed from the apparatus for ten or twelve minutes, he found himself suddenly bedewed with fine misty rain.

The carbonic acid formed in the air by respiration, putrefaction, and other processes, is considered to be the source of the carbon which forms the great bulk of plants. In fact the grandest trees of the forest derive their substance from the thin air. Mr Ellis describes several experiments which prove that plants draw their nourishment from carbon, and then inquires whether the air can really be supposed to contain food enough for the whole vegetable world? Humboldt tells us that in some forests of America a monkey might run for a hundred miles upon the tops of the trees. 'Does, in fact, the atmosphere contain a sufficient amount of this element to account for the separation of so great a mass of it as exists in this single instance, not to take into consideration the entire vegetation of the rest of the globe? The carbonic acid of the atmosphere has been estimated at one-thousandth of its whole weight. The entire weight of the atmosphere is known; and calculating upon it, it has been found that the entire weight of carbon contained at one time in the atmosphere is about three thousand and eighty-five billions of pounds. Calculations have been made as to the actual demand upon the atmosphere for carbonic acid of the whole vegetation of the earth. If we suppose the actual surface covered by vegetation to be one-fifth of the entire area of our globe, that will give a space of two millions of square miles, or of 43,124 millions of acres. Let us suppose that each acre derives every year 2000 pounds of carbon from the air; then the whole annual necessities of the vegetable world in a year amount to about 300 billions of pounds of carbonic acid. How is this enormous annual drain to be supplied? Dr Schleiden calculates that from *tobacco-smoking* alone we have a supply of carbonic acid in a year equivalent to 1000 millions of pounds. He bases this odd calculation on the following grounds:—North America alone produces

in a year enough tobacco, on its being burned, to yield the immense sum of 340 millions of pounds! The other tobacco-growing districts supply the rest. Yet how insignificant does even this enormous sum appear compared to that which, from combustion of fuel alone, escapes into the air! When it is remembered that from a number of other sources carbonic acid is discharged into the atmosphere, little difficulty as to the existence and constant supply of a sufficiency of this gas in the atmosphere to account for all the wood upon the earth's surface will be experienced.'

Although air gives the substance, light is essential to the life of a plant. The sunbeam has recently been divided into actinic, luminous, and calorific rays.

The actinic or chemical rays are indispensable to germination; under the influence of the luminous rays, a mantle of green overspreads forest and field, and the woody tissue is formed while the calorific rays bring forth flowers and fruit. Thus spring, summer, and autumn, enjoy each a peculiar influence from the sun; although probably in all the three processes of germination, growth, and fructification, the three forces are concerned, but in modified activity. Even during the day this distinction is observed, in the evening there being less actinic power than in the morning, and at noon more luminous and calorific power. These results are of entirely new discovery in science.

We have left ourselves little room for giving a notion of the contents of Part II., relating to the chemistry of the ocean, although it is not less interesting than the others. The quantity of saline matter differs in different seas, owing to the influence of evaporation removing a portion of the watery particles, and to the influx of fresh water from the land. But the quality differs, likewise, in different portions of the same mass of water, from the circumstance of sea water, in consequence of its saline contents, being more dense and heavy than fresh water. 'This is occasionally turned to some advantage by navigators; for it is found that, in calm weather, the fresh water overlies the salt, just as oil does in respect of water: by drawing water, therefore, from the surface, fresh water may be obtained; whereas, if the hose of the pump penetrates some feet down, it may encounter a stratum of salt water.

'A highly-interesting event, in connection with the chemistry of the waves, and important as illustrating their combined mechanical and chemical force, took place on the coast of Ballybunion in Ireland. The cliffs on this coast contain a large quantity of alum and iron pyrites; and being incessantly exposed to the violent action of the Atlantic billows, they become worn away into the most strange forms. Large caverns, natural bridges, and the resemblances of human architecture, abound on the sea-coast, being produced by the unequal wasting away of different strata. The roofs of these caverns are painted with various hues by the water percolating the overlying strata, and carrying with it a solution of the mineral ingredients encountered in its passage. Streamlets also run down the sides of the cliffs, staining them in ochreous colours, proving that the water contains iron, and probably other salts in solution. These solutions are conveyed into the sea, and there undergo various decompositions in contact with the saline matter of sea water. Some years since, part of these cliffs assumed an appearance of a very extraordinary character: the waves, by continual dashing, had worn and undermined the cliff, which, giving way, fell with tremendous violence into the sea; the consequence was, that several great strata of pyrites were exposed to the chemical influence of the air and sea water; rapid oxidation took place, eliminating such an intense heat, as very shortly to set the whole cliff on fire. For days the great rocks continued burning with great fierceness, torrents of steam and smoke rising up as the heavy billows of the Atlantic leapt upon the glowing masses, and at a distance presenting all the appearance of some violent volcanic disturbance. After the fresh substances,

thus exposed, had become oxidised, the steaming cliff gradually cooled down; and now the slow and silent work of mechanical and chemical destruction is being carried on without any external manifestation of its existence. The heat given out during this singular and grand chemical phenomenon was so great, as to convert masses of clay in its vicinity into red brick! while melted slags lie about, giving to the whole scene such an appearance as to render it a fit representation of the workshop of the mythological Cyclops.

Such are a few specimens of the interesting and amusing contents of a volume which will impart knowledge to the ignorant, while it recalls it in an agreeable manner to the learned.

THE MUSIC-MISTRESS.

AN ANECDOTE FROM REAL LIFE.

THE fire was burning bright on the hearth, and tea stood ready on the round table before it in a small up-stairs room in a narrow London street, about ten years ago; the curtains were drawn across the windows, though they scarcely met, by reason of their scanty dimensions, and barely served to exclude the uncomfortable light which lingered still in the foggy atmosphere without. The only inmate of the chamber was a middle-aged woman, with worn and delicate features, in whose appearance might be detected somewhat of a foreign origin: she was busied in giving as inviting an air as possible to all around her, when a light step sounded on the stairs, and in another moment she was warmly welcoming a young girl whom it was easy to recognise as her daughter. They spoke the melodious Spanish tongue, and there was the dark lustre of the south in the eyes of Inez Castarra, and its glow upon her lips when she entered; but these soon gave way to a languor and a degree of dejection, with which she seemed in vain trying to struggle as she took her accustomed low seat by the fire, and began to tell her mother the events of the day, while she partook of the evening meal.

'My poor child,' said Madame Castarra, 'how often I wish that we could only for once escape this chilly climate, and spend one winter in our own lovely land; there you would never have such an afternoon as this to encounter, nor cold English ears to listen to your beautiful music: there all is warmth, and song, and kindness.'

'Ah, but, dear mother,' replied Inez, smiling sadly, 'there might be want of bread too; and here I can earn enough for us both, and indeed I have no reason to complain of lack of kindness either. I am getting on better than I have yet had time to tell you; some fresh pupils have been offered to me by friends of the lady at whose house I sang last night; and as the spring comes on, I have no fear that my time will not be fully occupied; and then perhaps, when the season is over, you and I will be able to breathe the fresh air too, and walk in the lanes about some country village: I feel as if the sight of trees and wild-flowers would do me so much good!'

'And what are they here compared to the chestnut woods, and the cork-trees looking so hoary, beside the orange groves of our own beautiful Quinta! My Inez, you do not remember it as I do, nor the sky with its diamond brightness, and the air that makes one feel always light-hearted.'

This was Madame Castarra's favourite theme, and her daughter never interrupted her in it; but her eyes now filled with tears as she listened, and she rose and went to the little piano, which, with a few books, and two or three embroidered cushions, formed the only ornament of the room: she touched the first notes of a wild and plaintive melody which brought her mother instantly to her side.

'Forgive me, my child,' she said; 'I do not remember better than you do the days in which Louis Montero used to sing that serenade under our windows, waiting behind the trellis to know if I would let him in! Ah, poor fellow, it was well for him that he escaped when he did from Spain! Cheer up, Inez! we shall hear of him yet some day or other. But in the meantime, how can you go on day after day without rest or change? And now this singing in the evening, I do not half approve of it.'

Inez looked up inquiringly in her face: 'If you really disapprove of it, mother, I will not sing again at evening parties; but yesterday's experience made me fear it less than I did before, and it will enable us sooner to get the change of scene you think we both want.'

'Not me!' cried Madame Castarra impatiently. 'I am well, if it was not for heart-sickness at seeing your bloom fading away, and your talents, which were given you for your own enjoyment, all used for that of others, or to earn our poor livelihood in this smoky city.'

'But what must I do?' said Inez with her sweet quiet smile. 'When nothing else was left us but our love for each other, and my music, God made these sufficient; and hitherto the resource has not failed to supply our absolute wants in this strange land. I have found friends also among my pupils; and last night, as I was going to tell you, my whole heart was warmed by the interest shown towards me, as it would have been by a ray of our own dear sunshine. Lady Levers had asked me in the morning, when I had finished her daughters' lesson, if I would come and sing my Spanish ballads to her friends; and I willingly promised, as you know, to do so, little thinking what a large party there would be.'

'I know all that, Inez, of course,' interrupted her mother; 'and when you went in your black silk gown, with your hair so beautifully plaited, did I not long for some geraniums to put into it?'

'Yes; and picked your only flower for the purpose. Well, dear mother, I wanted to make quite a long story about it, so I would not tell you anything of the party till we were quiet for the whole evening.'

'Ah, poor child, it was one o'clock when you came home, and you were out again at nine this morning!'

'Once more,' said Inez laughing, as she resumed her seat by the fire, 'I shall begin. The rooms were already nearly full when I came in, and no one seemed to observe me, so I took the first seat I saw near the piano, thinking that I should be ready when I was wanted to sing; but one lady after another played and sung, and though I did not think the music very good, the continued sound, and the profusion of light, and the expectation of my own turn coming next, made me at last feel as if I should do myself no credit by my performance; and then the thought that people would wonder at my being employed to give lessons at all turned me almost sick with anxiety. Just as I had reached this agreeable pitch of nervousness, Miss Levers came up to me, saying, "Now I hope you will give us one of your beautiful ballads: I have talked so much of your singing this evening, and I have made every one sing before you, that your voice might come out with greater advantage." I of course signified that I was ready, and moved round to the instrument, feeling that I was the only person who had not been handed to it. Now, mother, you know that was very foolish!'

'Not at all, my love: I remember the time'—

Inez coloured, and continued hastily—'At that moment a lady, whose eye I had caught more than once before, came towards me, and in the kindest manner imaginable offered to accompany me, whispering a few words of encouragement and of evident sympathy that made me feel almost myself again. I was but too glad of a few minutes' pause; but you can scarcely fancy what her playing was! She glanced over my music, and then began a prelude which seemed to embody the very spirit of our national songs—low and tender at first, like the voice of lovers by the side of some flow-

ing stream, for they evidently mingled with the sound of waters; then came a spirit-stirring strain, awakening the soul of a hero to bold enterprise; after which the plaintive farewell swelled into fervent and passionate prayer; and oh, mother, I forgot all around me! my own soul was inspired by the gush of melody; and when Mrs Milner (for that, I afterwards learned, was her name) pointed to my music-book, and began the accompaniment to my favourite ballad of the "Roncesvalles Fight," I sang as I believe I never could have sung before, not even in Spain. "Bravo!" said Mrs Milner as I concluded: "this is more than I had expected." And she looked round, as if to gather up applause. There was the usual English silence for a minute, and then a hum went through the room, in which I distinguished the words of "How exquisite!" "What a thrilling voice!" "Such pure taste!" and many more to the same purpose. I felt I had succeeded beyond my hopes, but that my having done so was entirely owing to my generous friend; and yet people did not seem aware of how superior her talent was to mine.

"Nor need they have done that, my Inez," said Madame Castarra. "I always said your voice only needed to be fairly heard to be admired as it deserves: you always were too modest about it, and now I dread your exerting yourself too much: you looked so utterly exhausted when you came home, that I could not bear you to speak: though strangers might have been misled by the glow upon your cheek, and the brightness of your eyes, I could not be; and all this day I have been considering how it would be possible for you to go even for a few days into the country."

"We must not think of it," replied Inez; "not now at least, for I was intreated last night to sing one song after another, in some of which I accompanied myself; and at last Lady Levers told me many of her friends wished me both to sing at their houses, and to give lessons to their daughters. She assured them I had never given singing lessons at all; but I believe I might make several engagements both for singing lessons and the piano to-morrow, if only I was as strong now as I was a year ago." The languor that stole over the countenance of the poor girl as she uttered these words, and rested her head on the back of her chair, made her mother's anxiety about her appear but too well founded. In a few minutes more, early as it was in the evening, she was asleep by the fireside.

How different from Madame Castarra's humble room was the one in which sat the lady who had so kindly befriended Inez on the previous evening! She was conversing with Lady Levers in her luxurious boudoir on the subject which had chiefly occupied her thoughts ever since.

"It is out of the question, my dear Mrs Milner," said her hostess with the slightest possible sarcasm in her tone. "What would the world think of your giving music lessons? It might do as the whim of some earl's daughter—there is no accounting for what people of a certain rank will now and then imagine by way of charity; but permit me, as an old friend, to say that you might do yourself serious injury by such a plan: it would not be understood in one who, in fact, has won her very delightful standing in London society by being more accomplished and agreeable than almost anybody else."

Mrs Milner bowed playfully, and then continued her former proposal.

"I am far from disregarding the world's opinion; I would not willingly draw its censure on any part of my conduct with which it had to do; and I am well aware that, as the widow of a professional man who rose by the exercise of his noble talents, I may be more exposed to the suspicion you hinted at, of wishing to give lessons on my own account, than a person of greater wealth and more established natural position would be. But I am determined to help this poor young creature, if possible; and I see no other way of my doing so. All you tell me of her character and her misfortunes makes

me the more anxious to enable her to take advantage of the fine opening for her becoming known as a first-rate singing-mistress which your kindness last night afforded her. I had already judged of her talents as a pianist by the playing of her pupil, your eldest daughter; and I am sure she will do us all credit by and by, if she has sufficient rest now perfectly to recover her health, and likewise to gain confidence in her own powers."

"You are very good and self-devoted, my dear," replied Lady Levers coldly; "but I never can understand enthusiasm; and there always was so much of that about you! I can give Mademoiselle Castarra a couple of guineas, if that would be of any use; and really, if you knew how poor I am just now, you would see that it is as much as I could afford. Perhaps you might make a little subscription for her besides; but pray do nothing rashly yourself."

Mrs Milner's clear blue eye glanced round the apartment, with its silken furniture and costly baubles, and a smile just curled her lip; but she answered quietly: "I also could give something with pleasure; but it strikes me that, under present circumstances, our object must be to enable her to provide for herself, which she can only do by giving lessons. Now if I give them in her name for two months, or even six weeks, I think that is all she will need to support her mother and herself while she rests, and to give her a fair start in the world when she returns to London. Only promise that Augusta and Emily shall continue to be Mademoiselle Castarra's pupils under my instructions, and use your influence with others who have already employed her, or who intend now to do so, and I will take all consequences on myself."

There was an earnestness in Mrs Milner's intentions, a single-heartedness in her character, which seldom failed of winning confidence and sympathy; and Lady Levers was not proof against the power of her benevolence. She stood her ground as long as she could, and then yielded with a tolerably good grace, especially as she knew how much to her daughters' advantage it would be to receive lessons from so perfect a musician as Mrs Milner; and her visitor departed, leaving her to dress for an eight-o'clock dinner party, just as poor Inez was sinking into her doze by the fireside. Mrs Milner, followed by her page, walked rapidly towards her home, feeling at thirty-five much of the happiness of her girlhood, in the anticipation of a plan which she well knew would subject her to many hours of daily drudgery, at a time when London was filling fast with her acquaintance, and inflict terrible discords upon an ear strung to the highest pitch of musical accuracy. She stopped at a small house in a fashionable street, three or four rooms of which she called her own, and was received by the neatest of maid-servants, who lighted the lamp in her pretty sitting-room, and drew an easy-chair to the fireside. There was a look of perfect comfort in the apartment, and of unmistakable refinement, though it was simple, indeed, compared to the one Mrs Milner had just quitted. All it contained was elegant in itself, and suggestive of high and graceful ideas, from the pictures on the walls to the books on the tables, which seemed to lie there because they were read, and not only to be looked at; but this evening, though she held a volume in her hand as she sat by her cheerful hearth, and recalled many a brilliant conversation to which it had given rise, and though her piano stood open, with tempting new music upon it, her thoughts were still more frequently engaged with Inez, and she was pondering on the best means of making her acquiesce in her arrangement for her. Should she write, or should she go to her? She determined on the latter. I shall know her better, she thought, when I see how she is surrounded. A vision of the old shawl and half-dirty cap, from which dingy chrysalis she had often seen a Parisian belle emerge in noon-day elegance of attire, flitted before her as she settled to call on Mademoiselle Castarra at nine the following morning; and then the dignified simplicity of her manner and appear-

ance chased it away. 'It was such a revelation of soul and of genius,' she thought, 'that lighted up her features as she sang, that I can associate nothing with her that is not pure and beautiful.' Mrs Milner was not disappointed when she found Inez Castarra in her own home, though the flush of excitement had faded from her face, and the sickly hues of anxiety and fatigue were plainly seen upon it. The wondering gratitude of Inez and of her mother may easily be imagined, expressed, too, with the fervent eloquence of their southern blood, when they fully comprehended Mrs Milner's proposal: she would hear of no delays, for she saw that if her help was to effect the good she hoped for, it must be immediate; and she wished Madame Castarra and Inez to go at once to the lovely village in Devonshire in which she had passed her own early youth, and where she promised them a pleasant home in the house of a worthy couple whom she knew well. In the course of that happy week Inez had told her new friend all her own history, which was, indeed, like that of numbers in these last years of agitation and revolution. Her father had only escaped ending his days on the scaffold as a conspirator against the government of the day by dying in prison; her lover had been obliged to fly from Spain from the same cause; and, young as she was, she had persuaded her mother to let her seek subsistence in England for them both: their small estate had passed into the hands of strangers, and they were alone upon the earth.

'No longer alone,' said Mrs Milner with moistened eyes, taking up the list Inez had just given her of her pupils: 'you will find friends here who will not fail you; and perhaps more will be added by the time you come back, well and strong, and able to attend to them all; and then the unselfish exercise of talent is one of the highest enjoyments that can be given to us, and this, dear Inez, you will have.'

'Ah,' replied Inez, 'how happy then your lot must be!'

A cloud passed over Mrs Milner's open brow as she answered, 'This is not the moment for confession; mine will be happier now for some such exertion as you have made for years.'

And who can doubt that it was so? While Inez and her mother were enjoying the soft breezes of the south of Devon, in a cottage embowered in myrtle and chinaroses, Mrs Milner gave lessons day by day to all who would have employed the Spanish music-mistress. She had many clever pupils, whose love of melody she awakened to the uttermost; and some dull ones, to whom a lesson from an elegant and high-bred woman, who was the first of amateur performers, was but a lesson after all—paid for, and disliked; but she went steadily on, listening to the jokes and reproofs of her friends with good-humour that sprang from the depths of a heart in peace; and all the more sunshiny and charming when she mingled in society as usual, from the consciousness of her day's good deeds. Inez returned in the height of the London season, blooming with health and full of vigour: she found her engagements increased to as many as she could fulfil, and far better terms made for her than she had ever ventured to hope for. How far her restored health had been promoted by a letter from Louis Montero, imploring her to remember words spoken under the vine-covered trellis of the old Quinta, and to keep up her spirits for his sake, until he should come to claim his bride, we leave our readers to determine; but so it was that, for three years longer, no young lady's education could be supposed completed without at least a few lessons from Mademoiselle Castarra; and when Louis did come, though he was able to maintain his wife and her mother in comfort—for he had entered a merchant's house at Barcelona—Inez had enough of her own to provide abundantly for Madame Castarra's declining years; and on the wedding-day there was scarcely a happier heart than Mrs Milner's, as she recalled those six weeks of active charity. Even Lady Levers confessed that it would have been a thou-

sand pities to have sacrificed so much solid good to the possible prejudices of London society; which, after all, had known little, and remembered less, of Mrs Milner's singular exertions for a poor friendless foreigner.

RESENTMENT.

ALL philosophical inquiries appertaining to the nature and moral circumstances of man, seem to end in establishing the certainty of an adaptation of his attributes to his sublunary condition. His various passions, propensities, and sentiments, are shown to have relation and a reference to objects, modes of action, and states of existence, inseparable from a just development of his being. None of these can be reasonably considered evil in themselves, and do only become so by a vicious and perverted use—by such an inordinate and abusive exercise as transcends the limits of their original intention. Every principle or disposition, therefore, that is indigenous to the human constitution, must be recognised as existing in it for a necessary purpose, and one which, in its rightful manifestations, has a respect to human welfare. In this light it is here intended to consider the feeling of resentment.

Among the sermons of Bishop Butler—which are probably of greater value than all the other sermons in the language—there is one which treats directly of this subject. The good bishop begins by declaring that, in all considerations like the present, it is essential to understand our nature and condition according to their constitution; and thus to learn for what end any particular sentiment or passion has been given us. 'It will be needful,' says he, 'to trace it up to its original, that we may see *what it is in itself*, as placed in our nature by its Author; and thence it will appear *for what ends* it was placed here.' This is evidently the right way; for when we know what the passion is in itself, and the ends of it, we shall readily comprehend all its possible abuses, and may learn to shape our conduct in such wise as to avoid them.

Now resentment, as a natural feeling, manifests itself in two principal ways, according to the circumstances which give rise to it, and also in some degree to the pliancy or obstinacy of character which distinguishes the individual. In one case it is mere anger, hastily or suddenly excited, and usually subsides with the removal of the irritating circumstances which occasioned it; in the other, it is anger taking a deliberate and settled form, which does not disappear with the passing of the occasion, but is in some sort cherished and maintained, so as to become inveterate and habitual. Under this shape it has a natural tendency to become transformed into hatred or revenge; but in its manifestation as simple anger it is morally indifferent, and may be properly regarded as an *instinct*, having, like all other instincts, an appropriate and prescribed function. An examination into the causes by which this feeling is excited will enable us to perceive that it stands in our nature as an active antithesis, or repelling force, to all manner of sudden injury or violence, without relation to the merit or personal fault of those by whom the violence or injury is committed, or attempted to be offered. Hence the reason and end for which man was created liable to such a passion is, that he might be better qualified to resist, and thereby successfully defeat, any sudden violence or oppositions which would impair the welfare of his being, apart from a regard to the fault or injurious intentions of the individual contemplating or effecting them. 'Yet,' as the bishop remarks, 'since violence may be considered in this other and further view as implying fault; and since injury, as distinct from harm, may raise sudden anger, sudden anger may likewise accidentally serve to prevent or remedy such fault and injury. But, considered as distinct from settled anger, it stands in our nature for self-defence, and not for the administration of justice. There are plainly cases—and in the uncultivated parts of the world, and where

regular governments are not formed, they frequently happen—in which there is no time for consideration, and yet to be passive is certain destruction; in which sudden resistance is the only security.' The feeling or passion of anger must therefore be held as naturally blameless in its spontaneous manifestation, and is even clearly serviceable and indispensable as a weapon of protection against unjustifiable interferences and encroachments.

But from *this* feeling deliberate animosity, or resentment proper, is essentially distinguished, as the latter is not naturally excited by wrong or injury; nor indeed intended to prevent harm in the mere way of diverting its infliction, since it evidently implies a fixed disapprobation or dislike of the person who has happened to become its object. Let us again, for a few sentences, hear our sensible and worthy bishop. 'In order to see,' says he, 'as exactly as we can what is the natural object and occasion of such resentment, let us reflect upon the manner in which we are touched with reading, suppose, a feigned story of baseness and villany, properly worked up to move our passions. This immediately raises indignation, somewhat of a desire that it should be punished. And though the designed injury be prevented, yet that it was designed, is sufficient to raise this inward feeling. Suppose the story true, this inward feeling would be as natural and as just; and one may venture to affirm that there is scarce a man in the world but would have it upon some occasions. It seems in us plainly connected with a sense of virtue and vice, of moral good and evil. Suppose, further, we knew both the person who did, and who suffered the injury; neither would this make any alteration, only that it would probably affect us more. The indignation raised by cruelty and injustice, and the desire of having it punished, which persons unconcerned would feel, is by no means malice. It is rather resentment against vice and wickedness; it is one of the common bonds by which society is held together; a fellow-feeling which each individual has in behalf of the whole species as well as of himself. And it does not appear that this, generally speaking, is at all too high amongst mankind. Suppose now the injury I have been speaking of to be done against ourselves, or those whom we consider as ourselves: it is plain the way in which we should be affected would be exactly the same in kind; but it would certainly be in a higher degree, and less transient; because a sense of our own happiness and misery is most intimately and always present to us; and from the very constitution of our nature we cannot but have a greater sensibility to, and be more deeply interested in, what concerns ourselves. And this seems to be the whole of this passion, which is, properly speaking, natural to mankind—namely, a resentment against injury and wickedness in general, and in a higher degree when towards ourselves, in proportion to the greater regard which men naturally have for themselves than for others. From hence it appears that it is not natural, but moral evil—it is not suffering, but injury—which raises that anger or resentment which is of any continuance. The natural object of it is not one who appears to the suffering person to have been only the innocent occasion of his pain or loss, but one who has been in a moral sense injurious either to ourselves or others. This is abundantly confirmed by observing what it is which heightens or lessens resentment—namely, the same which aggravates or lessens the fault—friendship and former obligations on one hand, or inadvertency, strong temptations, and mistake on the other. All this is so much understood by mankind, how little soever it be reflected upon, that a person would be reckoned quite distracted who should coolly resent a harm which had not to himself the appearance of injury or wrong. Men do indeed resent what is occasioned through carelessness; but then they expect observance as their due, and so that carelessness is understood as faulty. It is likewise true that they resent *more strongly* an injury done than one which, though

designed, was prevented, in cases where the guilt is perhaps the same: the reason, however, is not that bare pain or loss raises resentment, but that it gives a new, and, as I may speak, additional sense of the injury or injustice. According to the natural course of the passions, the degrees of resentment are in proportion not only to the degree of design and deliberation in the injurious person, but in proportion to this joined with the degree of the evil designed or premeditated; since this likewise comes in to make the injustice greater or less. And the evil or harm will appear greater when they feel it than when they only reflect upon it; so, therefore, will the injury, and consequently the resentment will be greater.'

The natural object or occasion of settled resentment, then, being *injury*, as distinct from loss or pain, it is not difficult to see that to prevent and remedy such injury, and its incident miseries and disorders, is the end for which this passion has been implanted in mankind. It is to be considered as a weapon or power of defence with which nature has armed us, for the purpose of opposing injury, injustice, cruelty, and oppression; and its employment for such an end is manifestly rational, and in accordance with the tenor of our constitution. It being necessary for the very subsistence of the world, as well as for the reasonable comfort of individuals, that the practice or infliction of injustice should be so far punished or restrained, as to prevent the disorders and irregularities which would proceed from its unopposed indulgence—it is obvious that a naturally antagonistic passion, such as this of resentment, whose tendency it is to operate in the way of remedy or prevention, may be innocently exercised to the very extremity of its functions. Moreover, inasmuch as compassion is also natural to mankind, and would, if unbalanced in the constitution, render the execution and exaction of justice extremely difficult and unpleasant, and thus be oftentimes an obstacle to its fulfilment, a natural indignation or resentment against vice and wickedness would seem to be a fitting balance to the weakness and relenting tenderness of pity, as well as to anything besides which might obstruct the employment of such methods of severity as are required for a true adjustment of men's relations. 'The good influence,' continues Butler, 'which this passion has, in fact, upon the affairs of the world, is obvious to every one's notice. Men are plainly restrained from injuring their fellow-creatures by fear of their resentment; and it is very happy that they are so, when they would not be restrained from a principle of virtue.' Is it not resentment and indignation against injury and the authors of it, that, more effectually perhaps than anything else, secures the peace and consistency of society, in so far as it is maintained by the forcible restraint or punishment of offenders? The good bishop has no doubt that such is eminently the case among the generality of mankind; and holds that it 'is to be considered as a good effect, notwithstanding it were much to be wished that men would act from a better principle—reason and cool reflection.'

As to the *abuses* of resentment, they are palpably such as grow out of its connection with other passions, or consist in an excess and overstrained indulgence of the feeling, or in its mere indulgence as a selfish gratification. When, from partiality to ourselves, we imagine an injury done or designed us, while in reality there is none; when we entertain an extravagant animosity towards one who has innocently offended us; when our resentment is displayed on account of some pain or inconvenience which has accidentally befallen, though no injury was intended; when the indignation against injury and injustice bounds too high, and transcends the proportion due to the particular evil action which drew it forth; or finally, when counter injury in any kind is inflicted in the way of retaliation, and with a view only to gratify a resentful feeling—in these, and in all similar cases that can be conceived, there is an evident overstepping of justifiable resentment, and its manifestation so far ceases to be innocent

or morally permissible. Resentment, indeed, is liable to the same aberrations and perversions as any of the other passions or affections of human nature. There is, however, as Butler has remarked, one peculiarity which so generally accompanies and belongs to the excess and abuses of it as to require mention: 'a certain determination and resolute bent of mind not to be convinced or set right, though it be ever so plain that there is no reason for the displeasure, that it was raised merely by error or misunderstanding.' This is that inveterate and perverse resentment which we sometimes see in men, and which holds such rooted possession of their mind and temper, as to seriously damage and disfigure the whole character: against this it becomes every one to be upon his guard.

Considerations such as have been here presented are not indifferently calculated to illustrate the wisdom displayed in the constitution of our nature. 'Why,' says Butler, 'should men dispute concerning the reality of virtue, and whether it be founded in the nature of things, which yet surely is not matter of question; but why should this be disputed when every man carries about him this passion, which affords him demonstration that the rules of justice and equity are to be the guide of his actions? For every man naturally feels an indignation upon seeing instances of villany and baseness, and therefore cannot commit the same without being self-condemned.' Then, again—'We should learn to be cautious, lest we charge God foolishly, by ascribing that to him, or to the nature he has given us, which is owing wholly to our own abuse of it. Men may speak of the degeneracy and corruption of the world according to the experience they have had of it, but human nature, considered as the divine workmanship, should be treated as sacred; for in the image of God made he man. That passion from whence men take occasion to run into the dreadful vices of malice and revenge—even that passion, as implanted in our nature by God, is not only innocent, but a generous movement of mind. It is in itself, and in its original, no more than indignation against injury and wickedness; that which is the only deformity in the creation, and the only reasonable object of abhorrence and dislike. How manifold evidence have we of the divine wisdom and goodness, when even pain in the natural world, and the passion we have been now considering in the moral, come out instances of it!'

Upon the whole, we may conclude that resentment, as a natural feeling, is an essential and effectual element in our nature, and no more needs eradicating than the sense of sight or hearing; that since even these may be exercised profanely, so may the passion or feeling here in question; but that as, according to the old assertion, no abuse of a thing can be an argument or objection against its use, the proper and natural province of resentment is certain and unassailable. Injury, all unfairness, may undoubtedly be resisted and resented to the end—namely, that they may be superseded in the world, and give place to fairness and to justice. Let a man stand upon his rights, and respect the sacredness of his personality, yielding nothing to the presumption or usurpation of another who seeks to violate his due prerogatives; but, if needful for the preservation of his honour or independence, let him hurl defiance in the face of tyranny and unjust pretension, and bide the issue of the conflict with a resolute self-possession. He is justified in resenting whatsoever thing is calculated to humiliate or demean him in his reasonable self-esteem, and in claiming, in the front of arbitrary customs and conventionalities, a just acknowledgment of his individuality in the arrangement and economy of things. Yet, if his lot be hard, and beyond the chance of remedy, let him not lacerate his hands by beating frantically against the walls of the impossible. A day is ever advancing when the just thing shall be established, and there are noble compensations for them that endure well.

Nothing has been said here that militates against that divine precept which inculcates a generous for-

givenness of offences, or anyway disparages the habitual exercise of a kindly and charitable disposition. Let frailty have its fitting benefit of compassion. He who insists on spotlessness in another, would do well to inspect the purity of his own practices; for assuredly it belongeth not to man to ravage the creation under the fanatical pretext of reducing it to the beggarly perfection of his own idea. A man is most manlike, most Godlike, when he ceases to arrogate to his impotence the right of making other men after his own image, and, with a trustful confidence in the God that ruleth all, is content to offer modestly to the world, as a study and an example, a life adorned by earnest effort, sincere purposes, and an unpretending lowliness of mind.

STATE AND PROSPECTS OF CALIFORNIA.*

THE indefinite reports received some eighteen months since from the 'gold diggers' were everywhere laughed at. Men could not conceive the possibility of a metal so coveted as gold being picked up like shells and pebbles on the seashore. Later and more authentic intelligence, however, proved that for once rumour had fallen short of the truth. The gold region of California is of so vast an extent, that, compared with it, all other 'gold placers' (gold grounds) become insignificant. Already has gold been discovered in localities several hundred miles asunder. It is authoritatively asserted that the entire intervening territory, for a considerable breadth, is thickly impregnated with the same precious metal; and it is believed that the veins in the mountains, of which the deposits in the sand are merely the superficial washings, are at least six hundred miles in extent.

Colonel Mason, in his letters to the American government, states that gold throughout the valley of the Sacramento is exceedingly plentiful, and that he has seen thousands of men gold-gathering, none of whom made less than twenty dollars a day, while many had averaged from 500 to 1000 dollars a week. The editor of the 'Alta-Californian' newspaper, who is now a member of Congress, says, 'that with the aid of a shovel and a tin-pan he averaged 100 dollars *per diem*!' Mr William Dwight has certified to the government that he realised 1000 dollars one morning, and was working with a man named Palmer who was yet more fortunate; the latter having dug out a single lump which weighed four pounds! Mr Larkin, in a letter to Mr Buchanan, a member of Congress, says, 'The very sand in the gross, as it is drawn up from the bed of the river, is so thickly pervaded with gold-dust, as to be worth from 25 to 50 cents a pound.' James Crosby, a disbanded volunteer, writing to his friends, says, 'I have gathered 20,000 dollars' worth of pure gold; and I calculate, estimating my work at its present weekly average, to be worth 50,000 dollars in nine months.' Lieutenant Roach, late an officer in Colonel Stevenson's regiment, a man stated to be of undoubted veracity, says, 'He has so much gold, that he don't know what to do with it, and is anxious to return home, considering that he has provided enough.' These are but as one in a thousand of the certificates of the wealth of California current in all parts of America, and from thence issuing to every quarter of the world, while each despatch from the gold grounds enlarges the evidence.

The natural consequence is an excitement among mankind in all quarters of the globe which finds no parallel in history. Heads of families are rushing from all that is dear to them in quest of 'the root of all evil,' and wives and children are bemoaning the absence of husbands and fathers, and most religiously wishing that the gold-mines had never been heard of, and that California and its 'placers' had long ago been demolished by an earthquake.

* This paper is from the pen of a gentleman who, feeling a deep interest in the subject, has taken the trouble to collect all the information about it which was within his reach. His bias in favour of the country will be observed by the reader.—Ed.

But the excitement in this country is mildness itself compared with the frantic fever which rages on the other side of the Atlantic, whither we must now beg the reader to accompany us. There, on all sides, villages and towns are being almost deserted by their male inhabitants, who, scarcely giving themselves time to inquire the way, are rushing off to join in the gold hunt. Throughout Oregon and Mexico the roads are filled with travellers, with their faces all turned in one direction. In the village of San Padra not a soul remains. The fever having been wafted across the Pacific, the Chinese were, by the last accounts, throwing themselves into all manner of junks, and trusting themselves to the waves without a compass. The Sandwich Islands are being depopulated, many of them having lost 25 per cent. of their adult male population; and an American paper humorously observes, 'King Ramehamehda has lost his cabinet, and is advertising for a prime minister.'

Nor is the excitement less among the well-to-do in the larger American cities. The papers are crowded with advertisements relating to California, and all articles of merchandise connected with, or likely to be useful, in the gold region, have advanced in price. Merchants throw up their stores, clerks their engagements, lawyers their practice, and physicians their patients. Publishers and editors are joining the runaways by scores; and we have heard of a New York young gentleman who rose from a sick-bed and undertook the journey, in utter disregard of the advice of his doctor, who informed him that he could not possibly live a week among the hardships he was about to encounter.

But a still deeper injury has been inflicted upon the fair sex. Indeed the ladies generally show that they have hearts which 'can gold despise' when the commodity comes between them and their loves. In Lynn, Massachusetts, every second unmarried man has caught the contagion, while a fifth of the whole population are off beyond recall. Throughout each and all of the western states fearful havoc has been made among the bachelors. In Alabama and Louisiana single men are becoming rarities. But the most startling illustration of the point in question is the deplorable fact, that in Sag Harbour and its vicinity on Long Island, where there are two hundred beautiful girls, ranging from sweet seventeen to twenty-five years of age, there are but three males susceptible of hymeneal honours; and these poor fellows are so frightened and perplexed at the hopelessness of their minority, that unless the ladies lay an immediate embargo upon them, it is apprehended they will be off too! Even in New York the ladies are beginning to have more than their legitimate share of the promenades, and numbers of pale cheeks speak eloquently of departed lovers; while ugly fellows, that three months since no girl would think about, are beginning to look up and grow conceited. Indeed, owing to these gold regions, the American belles are in despair; and we shall soon expect to hear of a ship freighted for California with ladies on the search for runaway husbands and lovers, who never could have been true judges of genuine wealth, or they would not have left behind them the treasures they already possessed for all the yellow dross in the modern El Dorado.

The routes to California from New York are various; but the passage round the Cape, as it involves the least trouble and expense, appears to be the favourite. It is to be feared, however, that many who have gone this way lately will never reach San Francisco. Several of the vessels were shattered and leaky affairs, while their crews were apparently as mad as their passengers—willing to adventure anything to get to California, and hugging themselves with a covert determination to desert the ship as soon as they might arrive; and then the way the powder was stowed in many of the craft, was an additional security against a safe arrival at the mines, especially as nearly all the persons who went by them were confirmed smokers. If none of these vessels blow up, it will be rather owing to good-luck than to the prudence of the parties chiefly interested. The

passage round the Cape is variously estimated at from 14,000 to 18,000 miles, and occupies from four to six months, so that those who go that way have plenty of time to reflect on the use they will make of their gold before they begin to dig it. Travellers going this route should avoid going ashore anywhere on the Patagonian coast, as there are awful rumours of huge savages in that region, who are so partial to white men, that they eat up all and singular they can lay their hands on.

The doubling of the Cape, also, is an undertaking which, once effected, leaves a man no chance of being dubbed a fresh-water sailor. The swell of the ocean is enough to astonish even a well-accustomed tar. The calms are unlike those in most parts, for there is always a high sea running, and the lulls of the wind being so short, that the swell has no time to go down, while the vessels being under little or no command of sails or rudder, lie like logs in the water. The cold is intense, and to meet the wind in the teeth is absolutely impossible. The storms also are as sudden as they are unexpected. A cloud is seen to arise from the south-west, and before the order to haul down and clew up the sails can be obeyed, the fury of the tempest is upon the vessel—rain, hail, snow, and sleet, beat her with all the force the maddest wind can give them, and the whole heavens are in a moment as black as midnight. The miseries of the Horn are, however, borne by the sailors alone, for passengers are not even allowed to come on deck unless there is not only a calm, but a pretty considerable certainty of its continuance, and they are sent below at the faintest aspect of danger.

Among the land routes, the two in greatest favour are the one by way of Mexico, and that over the Rocky Mountains. In the former the journey is performed on mules from Vera Cruz, and occupies between a fortnight and three weeks. It is said to be rather pleasant than otherwise. At all events there is less danger of being starved on it than on the way by the mountains; for dreadful accounts have been received of the sufferings, from want of provisions, of persons who chose the latter. In one case it is stated that a party of six were reduced to the dreadful alternative of drawing lots to decide which should die to keep the others alive; and that one of the persons thus preserved was the victim's own brother! Nor is the Mexican mule route without its risks; but as the principal one is from robbers, companies of twenty and upwards incur but little danger, since no number of Mexican banditti will venture to attack such a band of armed Americans. A single traveller, however, is almost certain to be plundered, and may consider himself fortunate if he escapes with his life. A short time since John Anderson, one of a party of gold-hunters who set out from Buffalo, having ridden forward in advance of his companions, was ferociously set upon by three guerillas, who, dragging him from his mule, assaulted him with dirks and pistols, with which they beat and gashed him in a horrible manner; but Anderson being a powerful man, and armed with a stout cudgel, succeeded in killing one of his assailants, and keeping the others at bay until his comrades came up, who very coolly hung the surviving miscreants from a tree in halteres made with some of their own habiliments. Mr Anderson's wounds, fortunately, were not dangerous; and he is now in all probability compensating himself for his sufferings by heaping up piles of the precious metal.

The route by the Charges River is regarded with favour by some; but where this route is chosen, care should be taken not to land on its unhealthy banks. So favourable are these deadly marshes to the development of reptile life, that the land appears engrossed by monsters of antediluvian proportions. Even the common ground-worm is said to attain two feet in length, and is as venomous as a viper; while toads, boa-constrictors, crocodiles, snakes, scorpions, and lizards, literally cover the ground. There are also some extraordinary mammoth-looking creatures at present unknown in natural history, but which enterprise has already de-

terminated shall ere long visit more civilised parts. Mr Barnum, the proprietor of Tom Thumb, is said to have started an expedition to the banks of the Charges River to capture some of the monsters for his museum, from whence they will doubtless find their way to England. Whether any reptile really will be found of the colossal dimensions which travellers describe, remains to be proved; but certain it is that the great numerical force of the reptile tribe has given the Charges River almost as wide a reputation as California itself.

Although a number of the fair sex have found their way to California, they bear no comparison with the lords of the creation, and are appreciated accordingly. Most of these adventurous ladies also are married, and with their husbands, which renders the single ones still more valuable, and worth much more than 'their weight in gold.' It is indeed gratifying, say the reports, to see how they are sought after by swarms of the 'diggers,' who offer to lay mountains of gold dust at their feet in exchange for their hands. In some cases the damsels have surrendered, and been made lawful wives; but in the majority the suitors are so numerous, and so fiery, and so equally rich, that they (the ladies) are afraid to make a preference. The complaints which reach home are sufficiently flattering at least to the fair sex; for the loss of woman's society appears to be more keenly felt than any other privation. One man writes, 'This is a fine country no doubt; but to me it is as gloomy as Erebus; there are so few women in it.' Another suggests, 'If you want to do anything really good for California, send us a few ship-loads of marriageable girls. The homeliest woman in Boston, if she were here, would pass for an angel.' And another says, 'The ladies are sufficiently revenged on us; for in leaving them for the gold, we have exchanged the greatest treasure in life for what appears to us now to be a vast heap of rubbish.'

At present, notwithstanding the rumours to the contrary, we believe there has been little or no suffering from want of food in California; but the prices, in Mark-Lane parlance, 'rule high.' Good beds, clean linen, and the general comforts and even decencies of life, however, are things not to be contemplated. As to clean linen, perhaps few of the diggers can boast of the possession of two shirts; for a single shirt is worth so large a quantity of the 'dust,' that no man supposes he can afford to maintain a couple for the service of his own proper person. Moreover, the luxury of the laundry, even if the taste of the diggers ran that way, would be almost an impossibility, there being no ablutionary vessels; everything of that nature, from pearl-oyster shells upwards, being so devoted to the washing of gold, that it would be regarded as a species of profanation to use them for anything else.

Although the last winter has been more severe than has been known for fifteen years, the miners have engaged in the extension of their explorations, and have discovered new and productive deposits in all quarters. At a spot called the Georgetown Digging, twelve miles from Sutter's Mill, a yield has been obtained by many individuals at the rate of one pound per day, and two ounces or three ounces per diem is the present usual produce. Some large lumps of gold have also been found; one of fourteen pounds has been received at New York, and another of twenty-three pounds was lately exhibited at Stockton.

In some of the new 'diggings' the gold is remarkably fine, although so very abundant; and in consequence of the new mode of washing by the aid of quicksilver, coupled with greater experience in the work, and the great increase of immigration, it is confidently believed that at least five times the amount will be produced this year as compared with the last. The mining operations generally are also being conducted on a better organized system than heretofore. At first men rushed hither and thither, now claiming this territory, and anon resigning it for a more coveted spot, leaving frequently the most productive to some more fortunate

or more persevering adventurer. The floods which have been so disastrous this winter, threatening annihilation to the city of Sacramento, have not only washed up great quantities of gold, but have enlightened the miners as to their mode of working. Dams are therefore now in course of construction in many parts of the streams, and on the Tuolumne River a party of 100 men are engaged digging a canal half a mile in length, for the purpose of turning the stream. From their experience of the soundings already made, a certain yield of three to four ounces per diem to each man is confidently relied on.

The gold-gatherers have in a general way no regular meals, but feed extemporaneously on what they can get, standing, running, climbing, or digging, as the case may be. As may be imagined, the cookery is conducted in such primitive sort as would perfectly horrify the disciples of Soyer. But in these days supply of some description soon follows demand, and places of entertainment have been established for the accommodation of those who are more careful of their bodily comforts. These 'places' are principally kept by Indian families, and present a very gipsy-like appearance. They consist simply of a pot of 'lobscouse' suspended from a triangle of three poles in the open air. This 'lobscouse,' which is kept perpetually on the boil, is a miscellaneous preparation of meat, bread, potatoes, cabbage, and anything and everything not absolutely poisonous; the whole being dealt out to the guests at the rate of a dollar per pint. The Indians are well prepared also to accommodate their customers with 'fire-water,' for which they charge yet more exorbitantly; and acting on a principle known in our own land, many of their establishments are attended by handsome squaws as waitresses, who, feeling the importance of woman in that part of the world, assume airs and graces which would do credit to a more fashionable atmosphere.

Crime is very unfrequent throughout California, and appears to be kept much in check by the Lynch-law system of immediate punishment. At first, especially in the gold regions, there was a considerable amount of purloining going on; but rigid laws were enacted for the defence of the community, and the hanging of a few delinquents on the nearest tree instantaneously on their capture, soon had the effect of putting a stop to the system.

While every man at the 'gold placers' is intent upon the accumulation of wealth, it may readily be imagined that the 'events' of each day partake of pretty much the same character. The dislodging of an unusually large lump of gold, the discovery of a new vein, the arrival of a batch of diggers with news of 'home,' with now and then a visit of Indians from the interior, are the sole occurrences which break in upon the incessant search for the 'dust.' A short time since, a party of fine-looking Indians, of a tribe formerly unknown to Americans arrived at the 'diggings,' having among them three beautiful girls, who created an immense sensation. These Indians are described as being exceedingly intelligent, and very dignified and pleasing in their manners. Hearing by chance of the value set upon gold by the emigrants, they had made a journey to the mines for the purpose of becoming possessed of some of the precious metal. Their account of themselves throws some further light on the opinion now fast becoming general, that America was at one time peopled by a great nation, highly educated, and advanced in the arts. The visitors stated that they lived in a town several leagues distant to the north-west, and gave evidence of their acquaintance with the arts. It may be presumed, therefore, that they were not, in reality, of the common Indian stock, but descendants of the veritable 'mound builders,' the real aborigines of the country. A letter from the locality speaks highly of the Indian girls, describing them as 'ladies in demeanour, and perfect angels—though a little too dark for seraphim—in face and figure.'

Of all the companies which have gone to the mines,

none, it is thought, have been so fortunate as Colonel J. D. Stevenson's regiment of New York Volunteers. The men composing it were disbanded, or rather they disbanded themselves, at the first blush of the 'fever,' and being on the spot, immediately commenced operations. The result of their labour—the gold then lying in quantities on the margins of the streams—was such an accumulation of wealth as would probably have defrayed the entire cost of the Mexican war. Not content with the washings on the plain, the volunteers, who for the most part were stout, daring young fellows, distributed themselves over the mountains, and along the courses of the rivulets, where they found large lumps of the metal, which, owing to their size or position, could not be carried downward by the force of the water. These volunteers, when soldiers, were as rough and hardy a set of fellows as could be found; but the change in their pecuniary condition has raised them into the rank of conservators of the order, and the absolute law-makers of the golden territory. Mr Gilbert, formerly one of them, is now a member of Congress. He served his apprenticeship as a printer in the Albany Argus office, and when Colonel Stevenson's regiment was disbanded, started the 'Alta-Californian' newspaper. By the faithful and prudent management of that journal, Mr Gilbert has acquired for it the reputation of being the best journal in California, and has made it already one of the most valuable newspaper properties in the United States. He is at present only thirty years of age. Mr Wright went to California about a year ago, and has also been returned to Congress by a constituency larger than Mr Grinnell, who had for some time represented the Nantucket district.

The volunteers, being principally from the lower ranks of society, have, by the remittances of their treasures, wrought surprising changes in the appearance, position, and prospects of their friends in the American cities; and extraordinary, but in some cases true, anecdotes are rife respecting them. Old applewomen, whose sons had enlisted, are now purchasing costly gear preparatory to making their appearance in the circles of the aristocracy. Two little girls who recently swept the crossings in New Broadway have been transplanted to a celebrated school, to be educated with every accomplishment to fit them for their new destiny. A man who was a pauper in the almshouse four months since, has purchased a valuable estate, and is actually building a mansion upon it. The keeper of a little grog-shop in one of the purlieus of New York suddenly astonished his neighbours by kicking his stock in trade into the street, and inviting all who chose to bear it away—a sudden fit of generosity produced by the receipt of an ample supply of funds from the 'diggings.' A short time since an old man received a letter from his son, then in Panama, stating that, having deserted from the Volunteers, he was in a state of abject poverty, and begging the transmission of a few dollars to enable him to return home. While the father was endeavouring to comply with his son's request by raising a subscription among his friends, he received another letter with an advice of a keg of the 'dust,' amounting to nearly 50,000 dollars. In the early part of January a poor Irishwoman received a letter, which she carried to a lawyer in Wall Street, New York, to read for her. The lawyer, seeing the San Francisco postmark, became interested, and before breaking the seal, asked the woman who it was from?

'Faix, sir,' she replied, 'I don't know in the world, an' I'm thinking it's jist a mistake.'

'Have you no friend in California?'

'Divil a one, sir, nor anywhere else; an' it's not for the like of me to know where California is.'

'Did no member of your family go to the Mexican war?'

'Oh yes, yer honour—a baste of a husband, bad luck to him. He went off in Colonel Stevenson's regiment, and I hope he'll never come back.'

'That resolves it,' said the lawyer, opening the letter.

It contained a draft for 10,000 dollars on Howland and Aspinwall, and a note to the following effect:—

'DEAR PEGGY—I send you a *trifle*, which I hope is good, for I bought it on chance, and have more gold in my possession than would buy twenty such. Try and learn to be a lady as fast as ye can, for when I come home I'll make you as rich as a queen.'

The draft was presented, and duly honoured, and we believe Peggy has ceased altogether wishing that her 'baste of a husband may never come back.'

It is a singular fact that the existence of gold in the Californian mountains has been known for nearly two centuries. Mention is made of this in several old books; and there is a tradition extant that the mines were worked in former ages by races that have long since passed away. And this would appear to be true, from the discovery of ancient mining instruments in the locality. These latter are in the possession of Captain Sutter, one of the earliest gold-hunters in California, and who has gathered from the Indians a number of choice relics and legendary lore tending to prove that California was at one time a highly-civilised and powerful country. Report states that the captain has a storehouse filled with relics of incalculable value, consisting of plates covered with hieroglyphics; swords, chains, armour, helmets studded with gold; and a magnificent golden statue (size of life) of a beautiful female, seated in a conch shell, also of gold, which he dug up near the ocean shore, and which is supposed to have represented the goddess of the Pacific. It has been stated also that the vestiges of an ancient city have been discovered; and the prevailing opinion appears to be, that when the mining operations shall have been carried deeper, it will be found that California is not now for the first time trodden by thousands of human beings.

There are numerous stories in circulation as to the modern discovery of the gold-mines. It appears that the Californian Indians have long been aware of the 'bright sand,' as they called the gold dust, in and on the shores of the streams, but had not the slightest idea of its value, although they are remarkably covetous, cunning, and miserly about money, and set peculiar store by all kinds of gold coinage. They also state that formerly it was common to find lumps of the metal, some of them as large as a man's head, lying about; but that these all mysteriously disappeared soon after the arrival of Captain Sutter among them. This Captain Sutter is a remarkable man, and is now probably the richest individual in the world. He is a native of Switzerland, served as an officer in Charles X.'s body-guard, and subsequently resided in Baltimore, Philadelphia, and other parts of the United States, where he suffered much from poverty and hardship. At length, disgusted with the civilised world, he 'squatted' in the wilds of California, where, while ploughing the earth to raise food for his family, he discovered a quicksilver mine—the third in the world. He carefully preserved his secret until he had obtained from the Mexican government a grant of 40,000 acres of land, thus securing to himself that mine of wealth, which produces him an enormous and daily-increasing income. He has now upwards of 100 Indians at work at the mine, and retains more than double that number, all armed to the teeth, for the protection of his property. Although he had been gathering the gold in lumps and dust for several years, he was most successful in concealing the sources of his wealth. When the golden land was at length discovered, he sought to throw discredit on the intelligence by causing it to be published in the newspapers that there was far more to be gained in California by farming than by gold-digging, and that he set more value upon his cabbage garden than on all the mines of the territory.

There are three different stories extant respecting the immediate circumstances which led to the discovery of the golden secret, which appear to receive about equal credit. The first is, that wood being scarce, a squatter

named Grimes undertook the construction of a 'shanty' with stones, one of which attracting his attention, he subjected it to analysis, and ascertained that it contained seven ounces of pure gold, which naturally inducing him to search further, the discovery of the mines was the result. Another story is, that a traveller crossing a stream on a tree which had been thrown down as a bridge, fell into the water, and was covered with sand and mud. Packing his dirty clothes in his knapsack, for he had no time or means for drying and cleaning them, he proceeded to San Francisco, where, on opening his knapsack, he found its entire contents thickly covered with shining particles, which he preserved, and subsequently discovered to be gold, and thus established the fact of its existence in the Californian rivers. The third, and perhaps the most probable, is, that Messrs Howland and Aspinwall of New York, who are the agents of Captain Sutter, wondering where the latter obtained all the raw gold which he transmitted to them, thought they would penetrate the mystery. Accordingly, they sent out a young gentleman named Dimond, son of the celebrated shipbuilder of that name, to explore the land. The result of the expedition was, that Mr Dimond, about two years since, ascertained the captain's secret, and astonished the world by its promulgation.

The affluent and promising condition of the mining districts has given an immense impulse to the prosperity of the cities, which, on the breaking up of the winter, exhibited extraordinary activity. The flood which laid Sacramento city under water, drowning the live-stock, and threatening the whole district with ruin, appears to have inflicted but trifling injury on the market value of the property. Building is progressing at an extraordinary rate, and contracts and proposals already entertained and entered into amount to a million dollars.

At San Francisco street after street is rising rapidly; and as the late fire has induced the use of brick instead of wood in their erection, the city begins to assume a substantial appearance. Indeed so rapidly is every description of work progressing, that there must shortly be a lull in building operations, at least in the city, from the demand having been fully supplied.

San Francisco now has eight churches, some public schools, a Strangers' Friend Society, a Tract Society, &c. The price of ground, which, however, has attained quite a fictitious value, may be somewhat estimated by the fact, that government pays for the customhouse a rent of 98,000 dollars—nearly £20,000 per annum. The population is peculiarly free from serious or frequent crime; and where disturbances arise, they are very rapidly adjusted. The accessories of a highly-civilised state are also being rapidly arranged. A new Californian ship company has lately been schemed with a proposed capital of 1,000,000 dollars, of which 500,000 were subscribed by the cities of San Francisco and Sacramento; and the trade, which promises from all the ports of the Pacific, will be of the most lucrative description.

It appears probable also that coal will shortly be numbered among the indigenous products of the country. Some bituminous springs having been discovered on the coast, the most confident hopes are entertained that the experiments instituted will prove the existence of carboniferous deposits.

It may be readily imagined that nothing but commerce has a chance of attention in such a country at present. The arrival of emigrants and shipping, the sales of consigned goods, the continual consignments of gold dust, and the receipt of news from the gold placers, with the thousand excitements of living in a new and increasing country, are sufficient to occupy the mind, and prevent a recourse to the recreations enjoyed in a life of comparative leisure. Herz, the celebrated pianist, had, by the last accounts announced, a concert in San Francisco; but the above-mentioned causes, added to the paucity of ladies, would naturally tend to defer the

success of all exhibitions of this description until the excitement has in some measure subsided, and men's minds have settled down to a less galvanic mode of transacting the affairs of life than is common at present.

It is a singular fact, worthy of remark, that the commercial enterprise of the English mind was for some time at fault in the affairs of California. The intelligence of the gold-mines inspired many with a desire to visit the 'diggins;' but our traders forgot for once that where gold was so easily obtained, was precisely the place to send their manufactured commodities. The first supply, therefore, was from America and the south-western countries; and even now English traders are disappointed in the result of their speculations, because they rashly intrusted their goods to adventurers, and neglected to make themselves acquainted with the particular seasons when manufactured produce ought to arrive. A few failures, however, have corrected these errors; and there can be no doubt that the gold of California will give an impetus to the trade of England.

The internal resources of California, independent of its supply of the precious metals, are almost unprecedented. The country has from four to five hundred miles of sea-coast, with fine forests in the north—the waters filled with fish, and the plains covered with thousands of herds of cattle, while the soil is rich and fertile, and returning seventy to eightyfold. It is blessed also with one of the finest climates in the world, and is almost totally free from all epidemic or endemic diseases. The vineyards are exceedingly prolific, yielding an abundance of grapes; and there is a large and increasing population ready to consume the food which enterprise, labour, and capital shall assist to produce.

Agriculture, which has been mostly carried on under the auspices of the Mexican Catholics, is of a rude description; but an English gentleman has just started on an expedition which bids fair to revolutionise the whole system. This gentleman has fitted out a steam vessel of large dimensions, and has embarked a hundred chosen agricultural labourers with all necessary implements; and having obtained a large tract of country, he purposes cultivating it with corn for the Californian markets. In addition to this, he has taken apparatus for brewing, making wine, and distilling spirits, with gentlemen competent to take charge of this department of the project—the latter being a vintner from the continent of Europe. The preparations have been made on the most extensive scale; and there can be no doubt of the success of the experiments.

The tales of distress which have been wafted to this country are exceedingly exaggerated. There is no doubt that a person adventuring to a field where there is nothing but gold to be had, and where he must be content to lie in the open air, stand up to his middle in water and mud, and probably enter upon a course of manual labour to which he has been unaccustomed—will find himself surrounded with hardships. But if work is harder in a young settlement, it is less protracted, and success never fails to reward the determined, the enterprising, and the persevering. Those, however, who are afraid of labour, whether they are contemplating a journey to California, to Australia, to Natal, or to Texas, had better change their minds, and remain at home.

ANECDOTE OF LORD CLIVE.

FROM AN ORIGINAL SOURCE.

ALTHOUGH of a gloomy temperament, and from the earliest age evincing those characteristics of pride and shyness which rendered him unsocial, and therefore unpopular in general society, this nobleman, in the private walks of life, was amiable, and peculiarly disinterested. Whilst in India, his correspondence with those of his own family evinced in a remarkable degree those right and kindly feelings which could hardly have been expected from Clive, considering the frowardness of early life and the inflexible sternness of more

advanced age. When the foundation of his fortune was laid, Lord Clive evinced a praiseworthy recollection of the friends of his early days. He bestowed an annuity of £800 on his parents, while to other relations and friends he was proportionately liberal. He was a devotedly attached husband, as his letters to Lady Clive bear testimony. Her maiden name was Maskelyne, sister to the eminent mathematician so called who long held the post of astronomer royal. This marriage, which took place in 1752, with the circumstances attending it, are somewhat singular, and worth recording:—Clive, who was at that period just twenty-seven, had formed a previous friendship with one of the lady's brothers, like himself a resident at Madras. The brother and sister, it appears, kept up an affectionate and constant correspondence—that is, as constant an interchange of epistolary communication as could be accomplished nearly a century ago, when the distance between Great Britain and the East appeared so much more formidable, and the facilities of postal conveyance so comparatively tardy. The epistles of the lady, through the partiality of her brother, were frequently shown to Clive, and they bespoke her to be what from all accounts she was—a woman of very superior understanding, and of much amiability of character. Clive was charmed with her letters, for in those days, be it remembered, the fair sex were not so familiarised to the pen as at the present period. At that time, to indite a really good epistle as to penmanship and diction was a formidable task, and what few ladies, comparatively speaking, could attain to. The accomplished sister of Dr Maskelyne was one of the few exceptions, and so strongly did her epistolary powers attract the interest, and gain for her the affections, of Clive, that it ended by his offering to marry the young lady if she could be induced to visit her brother at Madras. The latter, through whom the suggestion was to be made, hesitated, and seemed inclined to discourage the proposition; but Clive in this instance evinced that determination of purpose which was so strong a feature in his character. He could urge, too, with more confidence a measure on which so much of his happiness depended—for he was now no longer the poor neglected boy, sent out to seek his fortune, but one who had already acquired a fame which promised future greatness. In short, he would take no refusal; and then was the brother of Miss Maskelyne forced to own, that highly as his sister was endowed with every mental qualification, nature had been singularly unfavourable to her—personal attractions she had none. The future hero of Plassy was not, however, to be deterred—but he made this compromise:—If the lady could be prevailed upon to visit India, and that neither party, on a personal acquaintance, felt disposed for a nearer connection, the sum of £5000 was to be presented to her. With this understanding all scruples were overcome. Miss Maskelyne went out to India, and immediately after became the wife of Clive, who, already prejudiced in her favour, is said to have expressed himself surprised that she should ever have been represented to him as plain. So much for the influence of mind and manner over mere personal endowments. With the sad end of this distinguished general every reader is familiar. His lady survived the event by many years, and lived to a benevolent and venerable old age. Her eldest son, Edward, second Lord Clive, having married the heiress of the House of Herbert, was created Earl Powis—that title, which had previously become extinct, being conferred on him and his descendants, who still enjoy it.

HOW TO DRESS WELL.

Dr Johnson, speaking of a lady who was celebrated for dressing well, remarked—'The best evidence that I can give you of her perfection in this respect is, *that one can never remember what she had on.*' Delicacy of feeling in a lady will prevent her putting on anything calculated to attract notice; and yet a female of good taste will dress so as to have every part of her dress correspond. Thus while she avoids what is showy and attractive, everything will be adjusted so as to exhibit symmetry and taste.

DOMESTIC PEACE.

The loss of physical force or menacing language we use—the less, to take an expressive word, we *scold* our children—the more order and quiet we shall commonly secure. I have seen a family where a single word, or a look even, would allay a rising storm. The gentle but firm method is the best security for domestic peace.—*Rev. A. B. Murray.*

OLD TIME.

INSCRIBED TO S. A. H.

YOUNG sculptor he, and full of youthful thoughts,
Who first devised yon figure of Old Time.
He knew him old, and gave him withered limbs,
Yet sinewy and strong for work withal;
And that stout scythe, for he had much to mow;
And those firm wings, for he had far to fly;
Then with one forelock and (a whim of Art)
A crystal hour-glass in the marble hand,
The statue stood complete.

And stood around
A group as young regarding. Fears were none,
But hopes were many—gratulating hopes
Each for his own glad prospect: while the gay
Were jeering him with, 'Graybeard, go thy way!
Mow, if thou wilt, the steppes of Tartary;
Or fly thee, if thou choose, from pole to pole!
For what art thou to us?'

Years were flown by:
When lo! beside that self-same statue stood
A few grayheaded men, the scant remains
Of whom had gazed before. Where were the rest?
But now methinks not only were their locks,
But eyesights changed, to which no more appeared
The same that statue, or had changed with them:
For that broad crystal cone down which of old
The sands had seemed to draw, they now saw dwarfed
To minute-glass, through which the glittering grains,
Too swift almost for aged eyes to follow,
Leapt twinklingly, as if in turn to jeer,
With, 'Now, good friends, we sure run fast enough?'
So, too, that scythe, whose length of curvature
Had seemed full fit to sweep uncounted fields,
Was now a short hooked sickle—fit not less
For its cramped breadth of harvest; and they heard,
Or thought they heard, it rasping audibly
With sharp brisk rustle 'mid the dry, sear stalks—
Themselves as dry and sear.

While each long wing,
Which might have borne strong eagle on his quest
From realm to realm, was clipt and rounded now,
As those which only just suffice to bear
The whirring partridge on from brake to brake,
If swift, yet soon to fall.

But, lo! now stood
There one beside that figure of Old Time,
That stood not there before, or was not seen
When youth is busied more to feel than see:
Figure it was with loosely-folded arms,
And bended brow, and introspective eye,
Which seemed as if it pondered on the past:
The young, had any such been mingling there,
Might well have wondered what such form could mean;
But of that grayhaired group which clustered round
Not one there was but knew the name; and sighed,
When asking, it was answered them—Regret.

H. C.

CHAMBERS'S EDUCATIONAL COURSE.

To this series of Elementary Works there is now added,

Price 1s. bound in cloth,

ACOUSTICS,

Being the fourth Treatise in NATURAL PHILOSOPHY.

CONTENTS.—I. GENERAL EXPLANATIONS—Velocity and Intensity of Sound—Duration of Sonorous Impressions—Nature of Waves of Air—Harmonic Divisions of an Elastic String—Vibration of Elastic Rods—Vibrations of Elastic Plates, Rings, Bells—Stationary Undulations in Canals and Pipes—Reed Pipes—Interference of Sounds—Method of estimating the number of Vibrations—Reflection of Sound—Resonance—Refraction of Sound—Echo.—II. ACOUSTIC INSTRUMENTS—Acoustic arrangements in Public Buildings.—III. MUSICAL SOUNDS—Transposition of Musical Scales—Musical Instruments.—IV. THE HUMAN VOICE—Speaking Machines.—V. ORGANS OF HEARING—Character and Variety of Sounds.

*** The Course of Natural Philosophy consists of the following Treatises, which, with the exception of Optics, are now published:—I. Matter and Motion.—II. Mechanics—Machinery.—III. Hydrostatics, Hydraulics, and Pneumatics.—IV. Acoustics.—V. Optics.—VI. Astronomy.—VII. Electricity.—VIII. Meteorology.

Published by W. & R. CHAMBERS, High Street, Edinburgh. Also sold by D. CHAMBERS, 20 Argyle Street, Glasgow; W. S. ORR, Amen Corner, London; and J. M'GLASHAN, 21 D'Olier Street, Dublin.—Printed by W. & R. CHAMBERS, Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 341. NEW SERIES.

SATURDAY, JULY 13, 1850.

PRICE 1½d.

JUSTICE AND CHARITY.

AN ENGLISH APOLOGUE.

IN the latter days of Henry VIII., when the King's Grace, as they called him, was more than ever on the look-out for heretics and traitors, occasionally dividing his royal attentions among coin-clippers, cut-purses, and begging vagrants also, whose numbers had marvellously increased in England since the suppression of the convents, there lived in the neighbourhood of Whitehall two friends, of whom no historian makes mention, as they took no public part in the mingled religion and politics of their times. They were distant kinsmen, remote branches of the noble House of Seymour, and quietly patronised by Catherine Parr, it was thought, on account of the lord whom she afterwards married and died so jealous of: but having no other titles, people in their generation distinguished them as Master Ralph and Master Richard.

Ralph had been an orphan brought up in a convent, and taught to regard the cowl as his future heritage, till the pope and the king quarrelled, when the convent with all its lands were bestowed on his cousin, the lineal representative of his family, who could not be induced to take the young novice even into his service for fear of royal displeasure. Upon which Ralph crossed the sea, turned minstrel, and wandered over Germany, where hesung to the knights of Lanstien, heard Martin Luther preach, saw John of Leyden set up his New Jerusalem in Munster, and returned just in time to witness the execution of his cousin on Tower Hill for something about Anne Boleyn: convent lands and all being of course resumed by the crown. But as Ralph was the legal heir, and Jane Seymour just proclaimed, the king graciously allowed him a pension of a hundred nobles out of the forfeited estate, and a promise of some future appointment in his household.

On that pension Master Ralph lived as a poor gentleman in London, entertaining himself by reading romances and composing pastoral ballads concerning shepherd queens and swains who died for love, which he was accustomed to sing to his mandolin; that much-esteemed instrument having been bestowed upon him in token of good-will and approbation by Ulrich von Hutten, the singing knight of Germany.

Master Richard had been the only son of a learned lawyer, who sent him to study the decretals at Rome, believing he would one day be Lord Chancellor; and there Master Richard studied painting under Michael Angelo, till the old lawyer's decease. But whether it was owing to the small fortune his father left him, or that Master Richard knew too well how it had been gathered, from that time he diligently eschewed the law, lived on his father's money, and employed his

leisure on imaginary portraits of court beauties, under the designations of Sylvia, Phillis, and Pastora.

Notwithstanding these pursuits, both were prudent bachelors, close upon fifty years, and never known to be moved beyond a verse or a sketch by all the dames that ever crossed their paths. Early and faint rumours indeed had spoken of a German Jewess whom Ralph had never sung, and an Italian silk-winder whom Richard never painted; but they had lived for years in quiet friendship, avoiding the dangerous disputes of the age, and studying together as they might the liberal arts and the lessons of old philosophy. There was a likeness in their ways and doings. Their cloaks and doublets were always purchased at the same shop, and the populace knew them as right worshipful gentlemen; but assigning to each his proper praise, they were apt to dwell on the fact, that Master Ralph never allowed a beggar to pass him empty-handed, and that Master Richard paid his bills the moment they became due.

Such was the popular character of the friends, when a whisper spread through the court, and thence through the city, that Queen Catherine Parr was suspected of doubting the king's supremacy; and another coronation, of course preceded by an execution for heresy, might be expected. It was perhaps with some reference to that ominous report that a trusty page appeared one morning at their lodgings, bearing the queen's commands to the Masters Seymour, as they were the only gentlemen acquainted with the mysteries of painting and poetry then within the bounds of London, to prepare with all speed a 'Morality' of most prudent and virtuous devices, which should be performed before the King's Grace on the approaching Easter. Such was the only form of the drama known at that period in England: it was long till Shakespeare's day, and Henry's court occasionally required Moralities; but a poet who would be honoured with royal orders for a play—were such things ever done in modern London?—might imagine the earnestness and alacrity with which Masters Ralph and Richard set about their task. The heaviest part of the duty indeed fell on Ralph's poetical shoulders; but besides having to manage scene and costume, Richard came in for a large share of the advising; and there was room for that, for it was requisite to keep orthodoxy in view, which, in the first Defender of the Faith's reign, was no easy matter for either Catholic or Protestant.

At length, however, it was agreed that the Virtues, conducted by Faith, should descend from Heaven by the ladder of Knowledge; and each in her turn make a speech of self-recommendation to the audience, inviting them to enlist immediately under her particular banner; at the last of which Wisdom should step from behind the throne, and explain that they were all one family, and she their governess. Whereupon Faith was to

wind up with some pertinent remarks on the encouragement afforded to her by the king of England, and the duties of subjects in general. The two friends presumed that this Morality would rather suit the royal taste; but an unforeseen difficulty arose in its construction. They had been at the palace by special permission, to survey the apartment in which the performance was to take place—and they say people looked on Charles I.'s scaffold from its windows scarcely a century after. But then things were in full preparation for the descent of the Virtues; the ladder of Knowledge had been already erected; and Ralph and Richard sat late together awaiting the appearance of Stellico the chemist, who had solemnly promised to bring the latter certain Spanish colours wherewith to paint the sky. Stellico called himself a Jew, but was believed to be a Morisco of Spain, who had taken refuge from their Catholic majesties in England long ago, when Granada was made a Christian city. For more than twenty years he had carried on business in St Paul's Churchyard, keeping a small dingy shop, where he sold all manner of strange dyes and medicines, told fortunes privately, and, men said, dealt in alchemy.

'The chemist tarries late,' said Richard, returning from a long look-out on old London's night; 'the bell of St Paul's has tolled nine, and the lights are going out in every house around us.'

'Late indeed, Master Richard,' said Ralph, as he looked up from the dim oil-lamp and thick papers before him; 'but let us set the Virtues in order till he come. What was the manner of it, canst thou tell, for my memory fails me?'

'Let me see,' said Richard, seating himself and rubbing up his brow. 'Courage clothed in scarlet, and crowned with laurel; Truth in a pure white robe, carrying a flaming torch; Temperance in a gray mantle and white train; and Justice, with her sword and balance, clad in the imperial purple'—

'Nay, that is not my mind,' interrupted Ralph; 'Charity must wear the purple, and begin the orations, as even St Paul hath declared her to be the queen of Virtues; but Justice shall appear last of all in a blue robe and velvet shoes, to signify her constancy and silent comings to the guilty.'

'Pshaw!' cried Richard, his artistic indignation rising; 'the very attire of Patience. I say again that Justice should wear the imperial purple: she by whom laws are framed, or ought to be (he added in an under tone), by whom kings reign and human society is cemented—who hath, besides, a royalty over all virtues, inasmuch as she is reckoned the special attendant of divinity. All the fathers agree that St Paul's words denote a heavenly charity: as for the earthly sort, it is but a poor beggarly virtue, fit to be commended only by old women and idle vagrants.'

Thus attacked, Ralph vigorously defended the claim of his favourite virtue to the purple. Indeed, which was the greatest had long been a disputed point in their philosophy; and it was now argued with all the zeal of an artist and an author. Ralph brought hosts of ancient divines and fathers to verify his opinion in favour of Charity, while Richard produced the classic philosophers in no less goodly numbers on the side of Justice.

The controversy grew warm, and the hour late, for a leaven of personality began to mingle with the argument; when the Seymours, who sat like brave old English gentlemen in a chamber hung with Flanders tapestry, and carpeted with a deep brown layer, never disturbed since it had been strewn green on the previous summer, were made aware by a step on the rushy floor that they were not alone; and turning both at the same instant, perceived Stellico the chemist, his tall, spare figure wrapped as usual in a black Spanish cloak, standing between them and the door.

'Your pardon, my masters,' said the old man with a reverence much slighter than his shop bow—'your pardon for playing the listener; but truly the question

you debate is one of great compass, and as I myself once studied philosophy under the renowned Solomon Ben Useff, the dispute has occupied my attention more than this hour past.'

'Hast thou been here an hour?' demanded Ralph in amazement. But Richard, whose temper was rather the hottest, forgot the morality sky and his Spanish colours in anxiety for a supporter, and hastily inquired which he thought had the best of the argument.

'Both have reasoned well,' said the chemist; 'but this question hath puzzled the sages of all nations; even divines and philosophers have disputed among themselves on the matter of Justice and Charity—which ought to bear sway in the universe, or have conferred the greater benefit on mankind. True it is that some have presumed to say those perplexed sages had but little acquaintance with either of the Virtues; but passing over such errors of the unlearned, I perceive that one of you inclines to the faith of Charity, and one to that of Justice. What think you, therefore, to question the past by a method which the master of wisdom, Dr Solomon, taught me, and learn from its answers which is most worthy to prevail?'

'Show us the method, good Stellico,' cried the Seymours, at once surprised and delighted at the chemist's knowledge. But before they had time to consider whether it might be heresy or witchcraft, he slowly waved his hand towards the door, which seemed cautiously opened from the outside, while groups of faces peered into the room. Ralph thought he had seen some of them long ago; but as his memory went backward, a strange and silent crowd seemed thickening beyond, and from amongst them there stepped in a man known to his earliest recollections as one old and poor, who regularly received alms at the convent gate, and now looked exactly as when he last relieved him.

'What brought thee to receive charity?' demanded Stellico, without a word of preface.

'Injustice!' said the old man. 'The Lord of Lessingham sent my two sons to the galleys for slaying a stag that ranged among our corn in harvest-time, and afterwards levelled the cottage my father had left me, and took the fields we tilled into his park.'

At the last word he stepped back into the crowd, and a woman pressed forward, young, but worn and withered, as Ralph guessed, with a wild, wicked life; for he remembered bribing a watchman of one of the Hanse towns with a tester to let her go on a dreary winter night, and giving her another to provide lodging when there was but one remaining in his minstrel's purse.

'Why should you ask me?' she said in reply to Stellico's inquiring look. 'I had a careless father, a harsh stepmother, and a poverty-stricken home. They put my brothers to trade. One became a woman's tailor, another dyed ribbons, and in process of time they wedded girls with portions; but custom left only one way to win my bread—and the world knows where it led me.'

As she spoke, a child stepped before her, but close behind him rose an indistinct shadow, like a tall gibbet, and Ralph knew the pinched young face as that of a little knave whom he had caught cutting his purse at Leipsic fair, but allowed to escape (though it was said he had been more than once in the town's prison), because of his tender years and piteous intreaties, with many good advices, and a penny to buy bread.

'I had idle and vicious parents,' he said, without waiting for look or question; 'my mother made me beg, and my father taught me to steal: there was no power to protect me from their control or counsels—and that was my share of Justice,' added the boy, pointing to the shadowy gibbet as he retired.

'I warned him it would come to that,' thought Ralph; but one after another there entered all the poor and distressed whom he had ever relieved or known; and one cry ran through all their answers, for some accused law, many their fellow-men, and even some the church

of injustice, which brought them to stand in need of Charity. There were those, too, who heavily charged what they called their fortunes; and one that looked at Ralph with a sad, dark face, saying, 'Was I to blame for being born a Jewess?'

'Thou seest, Master Ralph,' at length cried Richard, with whom fear and astonishment were for the moment sunk in the apparent success of his argument, 'that this Charity by which thou settest such store is but the narrow and uncertain resource of men who cannot attain to the broad security of Justice.'

'Thy words are strong in praise of Justice,' said the chemist with a sneer. 'Have thy deeds been equal?'

Richard almost started at this question from the Jew shopkeeper; but his astonishment was diverted to another channel by a clamour of voices at the door into which men, women, and children were pressing.

'He has expended my money of which his father defrauded me,' said one. 'He took my labour at half its value in a time of dearth,' cried another. 'He paid me with false coin, and he wore the doublet that was stolen from me,' shouted two in a breath.

'Some of your faces I have seen, and some of ye I never beheld,' said Richard; 'but of all these things with which ye charge me I know nothing.'

'Hadst thou inquired after them as curiously as thou didst after Senior Angelo's art, would they have escaped thee?' said a stern old man, bending in to look at Richard.

'Well questioned, stranger!' said Ralph, triumphant in his turn. 'But who art thou?'

'I am Piro, the Roman sculptor, to whose only daughter this man sung verses and told tales till he learned she had no portion, and Constanza became a nun,' said the old man.

'In the name of God did she take the vows?' cried Richard, springing from his seat: 'I never believed in that!' But at the same instant the crowd departed with a sound like that of a rushing wind, and some half-heard words from the sculptor concerning the 'burial vaults of our Lady del Deserto.'

'The day is near, and I too must go,' said Stellico; 'but, friends, when next ye write a Morality, dispute not whether Justice or Charity be the greater, for both are of Heaven. Yet know this, that Justice reigned first, but she has been so long banished from her kingdom that mankind scarcely remember her lineaments, and have made to themselves many a false resemblance. After the exile of Justice mortals invoked Charity; for though she can never fill her place, she hath always the surpassing skill to find room where Justice cannot so much as enter; nevertheless, it is believed that Justice will yet return to her throne on earth, and Charity rest from her labours; but the time is far off, and my journey long,' added the chemist as he stepped over the threshold.

'Whether so fast, worthy Stellico? Tell us whence came the people?' cried Ralph and Richard following him; but Stellico was gone. There was no trace of him in the passage or the street without; and they heard the first cock's crow faintly from the suburbs, for a gray glimmer of the dawn was already in the eastern sky. There was another debate between the Seymours, but neither a long nor loud one, whether or not they should accuse the chemist of sorcery; but when they were almost agreed on that proceeding, half London were up, and his apprentice arrived with the Spanish colours, and many apologies for the non-appearance of his master, who had been seized with violent sickness on the previous evening, which all his neighbours suspected was the plague. The Jew protested it was not for fear of losing custom; but the sickness proved his last, for he died on the ninth day in the chamber behind his shop, after a solemn declaration to his attendant rabbi that he had never been at the Seymours's lodgings, and believed it was none other than the spirit of Dr Solomon.

Of course the tale was told at the palace, composed in rhyme, and printed on broad sheets for the edification of all England. The king finding all his own theology

insufficient to settle the question, and being moreover rather occupied with the queen's affair, and his own last illness, left it to the divines of his kingdom, amongst whom it was a goodly bone of contention: the ultra-Catholic party maintaining it was St John, and the ultra-Protestant standing up for Satan, till it, together with many an old trifle, was lost in the various matches and conspiracies which threatened, though they did not shorten, the days of the Maiden Queen.

As for Masters Ralph and Richard, their convictions on the subject have not been handed down to posterity; but certain it is that they soon after retired to the ancient city of Coventry, and never wrote another Morality for the court of Henry VIII.

LEIGH HUNT'S AUTOBIOGRAPHY.*

If these volumes gave the personal as well as literary life of the author, he would rank as a second Boswell—only with not so great a man for the hero. He would be his own Boswell. He is proud of L. H., even of his little peculiarities, not to say failings. He takes the liberty of differing sometimes with him in opinion—but not rudely. Circumstances have changed. If L. H. had written now, he might have modified his expressions in some degree: but, after all, they were right at the time. In fact, he toadies himself a little—that cannot be denied; but over the whole is spread so genuine an air of *bonhomie* that the reader's attempts to demur are fruitless. Where he does not coincide, he at least acquiesces; he grows kindlier and couther as he and his author go on together; and at last he fairly slips his arm into his, calls him L. H. to his face without the Mister, and slides into his humour as men do into that of a genial companion over t'other bottle.

The personal history, we repeat, is omitted, for we are neither to be talked nor title-paged out of our senses. All we learn from the book is, that he was born at Southgate of such and such parents on the 19th of October 1784, and that in due time he quaffed Helicon and sky-blue at Christ's Hospital. After that we find him commencing certain publications—then we discover that he is married—then we accompany him on a pleasure ramble to Italy with his wife and seven children—then we are all at home again—and, finally, we are happy to learn that he has received a pension from government. But in lieu of personal and family details we have scenes, portraits, characters, opinions, and quotations from his own works without number. This injures the book as a whole, and may make some people even suppose it to be tedious in its discursiveness; but in point of fact, although it wants a sufficiently-marked thread of narrative to hold on by as you go through the volumes, there is interest and amusement in every page taken separately, and a pleasanter table-book, therefore, could not readily be found.

From his father, a Barbadian, who was always going to be made a bishop but never was, Mr Hunt received for his sole inheritance—and a rich one it was—a happy temperament, which his mother in vain endeavoured to qualify. 'I may call myself,' says he, 'in every sense of the word, etymological not excepted, a son of mirth and melancholy; for my father's Christian name (as old students of onomancy would have heard with serious faces) was Isaac, which is Hebrew for "laughter;" and my mother's was Mary, which comes from a word in the same language, signifying "bitterness." And, indeed, as I do not remember to have ever seen my mother smile, except in sorrowful tenderness, so my father's shouts of laughter are now ringing in my ears. Not at any expense to her gravity, for he loved her, and thought her an angel on earth, but because his animal spirits were invincible. I inherit from my mother a tendency to jaundice, which at times has

* The Autobiography of Leigh Hunt; with Reminiscences of Friends and Contemporaries. 3 vols. London: Smith, Elder, and Co. 1850.

made me melancholy enough. I doubt, indeed, whether I have passed a day during half my life without reflections, the first germs of which are traceable to sufferings which this tendency once cost me. My prevailing temperament, nevertheless, is my father's; and it has not only enabled me to turn those reflections into sources of tranquillity and exaltation, but helped my love of my mother's memory to take a sort of pride in the infirmity which she bequeathed me. This father, it appears, was somewhat wild for a clergyman; but he was fond of sermons nevertheless, and of reading the Bible, and above all, he was what his son calls somebody else, 'very generous and handsome-minded—a genuine human being.'

The impressions made in youth upon a happy temperament are always lasting and always delightful; while a differently constituted individual only learns to enjoy as he gets along, and looks back with disgust upon his early days. The youth of Leigh Hunt was a paradise. He remembers with complacency his blue gown, knee-breeches, and yellow stockings at Christ's Hospital; and if the small beer was undrinkable, he was allowed water with his bread instead. He has been told that the cranberries he has met with since must have been as fine, and as large and juicy as the cranberries of those days; but nevertheless he cannot persuade himself that he ever ate a true cranberry-tart since he used to visit in Austin-Friars: 'Blessed house! May a blessing be upon your rooms, and your lawn, and your neighbouring garden, and the quiet old monastic name of your street! and may it never be a thoroughfare! and may all your inmates be happy! Would to God one could renew at a moment's notice the happy hours we have enjoyed in past times with the same circles, and in the same houses! A planet with such a privilege would be a great lift nearer heaven. What prodigious evenings, reader, we would have of it! What fine pieces of childhood, of youth, of manhood—ay, and of age, as long as our friends lasted!'

Christ's Hospital was of course not all sunshine, otherwise the sunshine would not have been prized. It had even a horror of its own, and as this was of an original kind, we introduce it to our readers by its name of the Fazzer.

'The Fazzer was known to be nothing more than one of the boys themselves. In fact, he consisted of one of the most impudent of the bigger ones; but as it was his custom to disguise his face, and as this aggravated the terror which made the little boys hide their own faces, his participation of our common human nature only increased the supernatural fearfulness of his pretensions. His office as Fazzer consisted in being audacious, unknown, and frightening the boys at night; sometimes by pulling them out of their beds; sometimes by simply fazzing their hair ("fazzing" meant pulling or vexing, like a goblin); sometimes (which was horriest of all) by quietly giving us to understand, in some way or other, that the "Fazzer was out"—that is to say, out of his own bed; and then being seen (by those who dared to look) sitting, or otherwise making his appearance, in his white shirt, motionless and dumb. It was a very good horror of its kind. The Fazzer was our Dr Faustus, our elf, our spectre, our Flibbertigibbet, who "put knives in our pillows and halts in our pews." He was Jones, it is true, or Smith; but he was also somebody else—an anomaly, a duality, Smith and sorcery united. My friend Charles Ollier should have written a book about him. He was our Old Man of the Mountain, and yet a common boy.'

The chief luxury was spending money when there was any to spend. Hunt's parents were both as 'generous as daylight' (he forgets the assessed tax!), but they could not give what they had not; so the task of teaching him the use of money was reserved for his rich aunt, who presented him sometimes with a half-guinea. The first that came was a poser. What to do with so vast a sum? He held a consultation with his companions, and 'one shilling was devoted to pears,

another to apples, another to cakes, and so on, all to be bought immediately, as they were; till coming to the sixpence, and being struck with a recollection that I ought to do something useful with that, I bought sixpenn'orth of shoe-strings.'

At length the time came when it was necessary to make his entrance into the world; and after going bare-headed for eight years, except on the rare occasion when he stuck his little *crumpe* of a cap on its few inches of pericranium, he was made to assume that strange uncomfortable absurdity—a hat.

'I then cared as little for the rains as I did for anything else. I had now a vague sense of worldly trouble, and of a great and serious change in my condition; besides which, I had to quit my old cloisters, and my playmates, and long habits of all sorts; so that, what was a very happy moment to schoolboys in general, was to me one of the most painful of my life. I surprised my schoolfellows and the master with the melancholy of my tears. I took leave of my books, of my friends, of my seat in the grammar-school, of my good-hearted nurse and her daughter, of my bed, of the cloisters, and of the very pump out of which I had taken so many delicious draughts, as if I should never see them again, though I meant to come every day. The fatal hat was put on; my father was come to fetch me.

We, hand in hand, with strange new steps and slow,
Through Holborn took our meditative way.'

But he carried his youth with him, and his predisposition to be happy, and to love and admire the beautiful wherever he found it: a little girl standing in a little river with bare legs washing some linen realised one of those visions of which he expected to find the world full. This was a vision of an oval face, with blue eyes full of gentle astonishment, and a profusion of flaxen locks on either side. But at that time he took 'every beauty for an Arcadian, and every brook for a fairy stream; and the reader would be surprised if he knew to what extent I have a similar tendency still. I find the same possibilities by another path.'

A little later he saw another vision on the stage, and his description of it is one of the best things in the book, or perhaps in any book. 'Mrs Jordan was inimitable in exemplifying the consequences of too much restraint in ill-educated country-girls, in romps, in hoydens, and in wards on whom the mercenary have designs. She wore a bib and tucker, and pinafore, with a bouncing propriety, fit to make the boldest spectator alarmed at the idea of bringing such a household responsibility on his shoulders. To see her when thus attired shed blubbing tears for some disappointment, and eat all the while a great thick slice of bread and butter, weeping, and moaning, and munching, and eyeing at every bite the part she meant to bite next, was a lesson against will and appetite worth a hundred sermons of our friends on board the hoy; and, on the other hand, they could assuredly have done and said nothing at all calculated to make such an impression in favour of amiableness as she did, when she acted in gentle, generous, and confiding characters. The way in which she would take a friend by the cheek and kiss her, or make up a quarrel with a lover, or coax a guardian into good-humour, or sing (without accompaniment) the song of "Since then I'm Doomed," or, "In the Dead of the Night," trusting, as she had a right to do, and as the house wished her to do, to the sole effect of her sweet, mellow, and loving voice—the reader will pardon me, but tears of pleasure and regret come into my eyes at the recollection, as if she personified whatsoever was happy at that period of life, and which has gone like herself. The very sound of the little familiar word *and* from her lips (the abbreviation of husband), as she packed it closer, as it were, in the utterance, and pouted it up with fondness in the man's face, taking him at the same time by the chin, was a whole concentrated world of the power of loving.'

Reading, then, came to multiply his visions, and more

especially the reading of the 'Parnaso Italiano,' a collection of poetry in fifty-six 12mo. volumes, for which he joyfully paid L.30, under rather extraordinary circumstances. He was condemned to two years' imprisonment for a political libel, and the 'Parnaso' was a 'lump' of sunshine on his shelves, in which nymphs, enchantresses, magicians, heathen gods, and Christian saints, disported themselves together. The reader, he tells us, would be surprised to know to what a literal extent this was the case; but why should he be surprised, knowing as he does the kind of abode into which this matter-of-fact observer metamorphosed his prison? 'I papered the walls with a trellis of roses; I had the ceiling coloured with clouds and sky; the barred windows I screened with Venetian blinds; and when my bookcases were set up, with their busts, and flowers and a piano-forte made their appearance, perhaps there was not a handsomer room on that side the water. I took a pleasure, when a stranger knocked at the door, to see him come in and stare about him. The surprise on issuing from the Borough, and passing through the avenues of a jail, was dramatic. Charles Lamb declared there was no other such room except in a fairy tale. But I possessed another surprise; which was a garden. There was a little yard outside the room, railed off from another belonging to the neighbouring ward. This yard I shut in with green palings, adorned it with a trellis, bordered it with a thick bed of earth from a nursery, and even contrived to have a grass-plot. The earth I filled with flowers and young trees. There was an apple-tree, from which we managed to get a pudding the second year. As to my flowers, they were allowed to be perfect. Thomas Moore, who came to see me with Lord Byron, told me he had seen no such heart's-ease. I bought the 'Parnaso Italiano' while in prison, and used often to think of a passage in it while looking at this miniature piece of horticulture:—

" Mio picciol orto,
A me sei vigna, e campo, e selva, e prato."
BALDI.

" My little garden,
To me thou'rt vineyard, field, and meadow, and wood."

Here I wrote and read in fine weather, sometimes under an awning. In autumn my trellises were hung with scarlet runners, which added to the flowery investment. I used to shut my eyes in my arm-chair, and affect to think myself hundreds of miles off.

But this was nothing. Any 'decorator' might have done as much; but Leigh Hunt, by dint of imagination, without any assistance from material objects, converted the large garden of the prison into an extensive domain, certainly as large as a gentleman's park at the least. He divided this ground into districts, dressed himself elaborately, put on his gloves, and taking a book under his arm, sallied forth to enjoy a long walk, requesting his wife not to wait dinner if he should be too late. In this prison he wrote poetry by the mile, and saw friends by the score; and so mightily were his visitors affected by the state which surrounded him, that even the radical Hazlitt would stand with his hat off on the threshold, while his host had some difficulty in getting him to pass.

Perhaps the best things in this work are the author's opinions of men and books. They are always clear, sparkling, racy, frequently just, but rarely profound. The fling at Izaak Walton is admirable, and his home question to those who seek amusement in sufferings that are unnecessary and avoidable is worth a sermon. The strange thing is, that the ladies and gentlemen who make a practice of impaling living creatures on an iron instrument, which they then recreate themselves by trying to tear through the entrails of other living creatures, are considered all the more amiable for these devilries. Angling is decidedly an innocent, nay, a Christian employment, for somehow or other it is supposed to have a sort of affinity with religion! 'As to old Izaak Walton, who is put forward as a substitute for

argument on this question, and whose sole merits consisted in his having a taste for nature and his being a respectable citizen, the trumping him up into an authority and a kind of saint is a burlesque. He was a writer of conventionalities; who, having comfortably feathered his nest, as he thought, both in this world and in the world to come, concluded he had nothing more to do than to amuse himself by putting worms on a hook and fish into his stomach, and so go to Heaven, chuckling and singing psalms. There would be something in such a man and in his book offensive to a real piety, if that piety did not regard whatever has happened in the world, great and small, with an eye that makes the best of what is perplexing, and trusts to eventual good out of the worst. Walton was not the hearty and thorough advocate of nature he is supposed to have been. There would have been something to say for him on that score, had he looked upon the sum of evil as a thing not to be diminished. But he shared the opinions of the most commonplace believers in sin and trouble, and only congratulated himself on being exempt from their consequences. The overweening old man found himself comfortably off somehow; and it is good that he did. It is a comfort to all of us, wise or foolish. But to reverence him is a jest. You might as well make a god of an otter. Mr Wordsworth, because of the servitor manners of Walton and his biographies of divines (all *anglers*), wrote an idle line about his "meekness" and his "heavenly memory." When this is quoted by the gentle brethren, it will be as well if they add to it another passage from the same poet, which returns to the only point at issue, and upsets the old gentleman altogether. Mr Wordsworth's admonition to us is—

" Never to link our pastime or our pride
With suffering to the meanest thing that lives."

The remarks on Hogarth, and on the lessons to youth generally, which were fashionable during our author's nonage, are likewise in Mr Hunt's best style. Every good boy was to ride in his coach and be a lord mayor, and every bad boy was to be hung or eaten by lions; and so Hogarth's 'Apprentices' identify virtue with prosperity and vice with bad fortune. Hogarth, however, 'in most of his pictures, was as healthy a moralist as he supposed himself, but not for the reasons which he supposed. The gods he worshipped were Truth and Prudence; but he saw more of the carnal than spiritual beauties of either. He was somewhat of a vulgarian in intention as well as mode. But wherever there is genius, there is a genial something greater than the accident of breeding, than the prevailing disposition, or even than the conscious design; and this portion of divinity within the painter, saw fair-play between his conventional and immortal part. It put the beauty of colour into his mirth, the counteraction of mirth into his melancholy, and a lesson beyond his intention into all: that is to say, it suggested redemptions and first causes for the objects of his satire; and thus vindicated the justice of nature at the moment when he was thinking of little but the pragmatism of art.' 'Sandford and Merton' was the first healthy juvenile book that appeared; and in the present day, although there are of course varieties of merit in such productions as in others, there is little or no absolute trash.

Campbell gave our author the idea of a French Virgil—'Something a little more cut and dry than I had looked for; compact and elegant, critical and acute, with a consciousness of authorship upon him; a taste over-anxious not to commit itself, and refining and diminishing nature as in a drawing-room mirror. This fancy was strengthened in the course of conversation, by his expatiating on the greatness of Racine. I think he had a volume of the French poet in his hand. His skull was sharply cut and fine; with plenty, according to the phrenologists, both of the reflective and amative organs: and his poetry will bear them out. For a lettered solitude, and a bridal properly got up, both according to law and luxury, commend us to the lovely

Gertrude of Wyoming. His face and person were rather on a small scale; his features regular; his eye lively and penetrating; and when he spoke, dimples played about his mouth; which, nevertheless, had something restrained and close in it. Some gentle Puritan seemed to have crossed the breed, and to have left a stamp on his face, such as we often see in the female Scotch face rather than the male. But he appeared not at all grateful for this; and when his critiques and his Virgilianism were over, very unlike a Puritan he talked!

Sir Walter Scott he considers to be, upon the whole, 'the greatest writer Scotland has produced;' but we doubt whether he comprehends well in what this greatness consisted. His being 'the least quotable for sententiousness or wit, or any other memorable brevity, in the whole circle of illustrious writers,' is not a defect in Scott's literary character, as Mr Hunt seems to consider it. Scott was an artist—that is the whole secret. His efforts were directed, not to minute points of the picture, but to the general effect. He was more a writer of epics than of epigrams. The very rapidity with which he wrote shows his possession of the subject, while it necessarily involves a want of attention to the finish and nicety of details.

Here is his sketch of Wordsworth:—'Mr Wordsworth, whom Mr Hazlitt designated as one that would have had the wide circle of his humanities made still wider, and a good deal more pleasant, by dividing a little more of his time between his lakes in Westmoreland and the hotels of the metropolis, had a dignified manner, with a deep and roughish but not unpleasing voice, and an exalted mode of speaking. He had a habit of keeping his left hand in the bosom of his waistcoat; and in this attitude, except when he turned round to take one of the subjects of his criticism from the shelves (for his contemporaries were there also), he sat dealing forth his eloquent but hardly catholic judgments. In his "father's house" there were not "many mansions." He was as sceptical on the merits of all kinds of poetry but one, as Richardson was on those of the novels of Fielding. Under the study in which my visitor and I were sitting was an archway, leading to a nursery-ground; a cart happened to go through it while I was inquiring whether he would take any refreshment; and he uttered, in so lofty a voice, the words, "Anything which is going forward," that I felt inclined to ask him whether he would take a piece of the cart. Lamb would certainly have done it. But this was a levity which would neither have been so proper on my part, after so short an acquaintance, nor very intelligible perhaps, in any sense of the word, to the serious poet. There are good-humoured warrants for smiling which lie deeper even than Mr Wordsworth's thoughts for tears. I did not see this distinguished person again till thirty years afterwards, when, I should venture to say, his manner was greatly superior to what it was in the former instance, indeed quite natural and noble, with a cheerful air of animal as well as spiritual confidence; a gallant bearing, curiously reminding one of a certain illustrious duke, as I have seen him walking some dozen years ago by a lady's side, with no unbecoming oblivion of his time of life. . . . Walter Scott said that the eyes of Burns were the finest he ever saw. I cannot say the same of Mr Wordsworth—that is, not in the sense of the beautiful, or even of the profound. But certainly I never beheld eyes that looked so inspired or supernatural. They were like fires half burning, half smouldering, with a sort of acrid fixity of regard, and seated at the further end of two caverns. One might imagine Ezekiel or Isaiah to have had such eyes.'

His portrait of Lamb is, upon the whole, good, though finical. 'As his frame, so was his genius. It was as fit for thought as could be, and equally as unfit for action; and this rendered him melancholy, apprehensive, humorous, and willing to make the best of everything as it was, both from tenderness of heart and abhorrence of alteration. His understanding was too

great to admit an absurdity; his frame was not strong enough to deliver it from a fear. His sensibility to strong contrasts was the foundation of his humour, which was that of a wit at once melancholy and willing to be pleased. He would beard a superstition, and shudder at the old phantasm while he did it. One could have imagined him cracking a jest in the teeth of a ghost, and then melting into thin air himself, out of a sympathy with the awful. . . . I should say he condescended to be a punster, if condescension had been a word befitting wisdom like his. Being told that somebody had lampooned him, he said, "Very well, I'll Lamb-pun him." His puns were admirable, and often contained as deep things as the wisdom of some who have greater names—such a man, for instance, as Nicole the Frenchman, who was a baby to him. He would have cracked a score of jokes at him worth his whole book of sentences: pelted his head with pearls. Nicole would not have understood him, but Rochefoucault would, and Pascal too; and some of our old Englishmen would have understood him still better. He would have been worthy of hearing Shakspeare read one of his scenes to him, hot from the brain. . . . He was fond of telling wild stories to children, engrafted on things about them; wrote letters to people abroad, telling them that a friend of theirs had come out in genteel comedy; and persuaded George Dyer that *Lord Castlebrough* was the author of "Waverley!" . . . He knew how many false conclusions and pretensions are made by men who profess to be guided by facts only, as if facts could not be misconceived, or figments taken for them; and therefore one day, when somebody was speaking of a person who valued himself on being a matter-of-fact man, "Now," said he, "I value myself on being a matter-of-lie man." But Lamb, for all that, was a man of great veracity, although even the truth he told sometimes in jest. The writer of these columns once met him at dinner (for the first time), and on being asked to take wine with him, replied with some *empressment* of manner; on which Lamb, stretching forward confidentially, remarked in his stuttering way—which seemed to give point to his jokes rather than otherwise—"But don't think anything of that, for I would t—take wine with anybody!"

Coleridge next. Coleridge was as little fitted for action as Lamb, but on a different account. His person was of a good height, but as sluggish and solid as the other's was light and fragile. He had, perhaps, suffered it to look old before its time for want of exercise. His hair was white at fifty; and as he generally dressed in black, and had a very tranquil demeanour, his appearance was gentlemanly, and for several years before his death was reverend. Nevertheless, there was something invincibly young in the look of his face. It was round and fresh-coloured, with agreeable features, and an open, indolent, good-natured mouth. This boy-like expression was very becoming in one who dreamed and speculated as he did when he was really a boy, and who passed his life apart from the rest of the world, with a book and his flowers. His forehead was prodigious—a great piece of placid marble—and his fine eyes, in which all the activity of his mind seemed to concentrate, moved under it with a sprightly ease, as if it was pastime to them to carry all that thought. He does not consider him to have been the ethereal being he is represented by Hazlitt. 'I fancied him a good-natured wizard, very fond of earth, and conscious of reposing with weight enough in his easy-chair, but able to conjure his etherealities about him in the twinkling of an eye. He could also change them by thousands, and dismiss them as easily when his dinner came. It was a mighty intellect put upon a sensual body; and the reason why he did little more with it than talk and dream was, that it is agreeable to such a body to do little else. I do not mean that Coleridge was a sensualist in an ill sense. He was capable of too many innocent pleasures to take any pleasure in the way that a man of the world would take it. The idlest

things he did would have had a warrant. But if all the senses, in their time, did not find lodging in that humane plenitude of his, never believe that they did in Thomson or in Boccaccio. Two affirmatives in him made a negative. He was very metaphysical and very corporeal; so in mooting everything, he said (so to speak) nothing. His brains pleaded all sorts of questions before him, and he heard them with so much impartiality (his spleen not giving him any trouble) that he thought he might as well sit in his easy-chair and hear them for ever, without coming to a conclusion. It has been said (indeed he said himself) that he took opium to deaden the sharpness of his cogitations. I will venture to affirm, that if he ever took anything to deaden a sensation within him, it was for no greater or more marvellous reason than other people take it—which is, because they do not take enough exercise, and so plague their heads with their livers.'

But we might go on long enough quoting from this most genial book. Leigh Hunt is now in his sixty-sixth year, and we have no doubt he intends to live on his father's temperament a quarter of a century longer. 'It is astonishing,' says he, 'how long a cordial pulse will keep playing if allowed reasonably to have its sway.' The men he describes as dying at a good old age were all hearty, kindly, natural people; and even if they indulged in an extra bottle of wine, it did them no harm. 'I do not know,' says he, 'whether such men ever last as long as teetotalers; but they certainly last as long, and look a great deal younger than the carking and severe.' They last longer, Mr Hunt, and they never grow old at all!

RECOLLECTIONS OF A POLICE-OFFICER.

THE PURSUIT.

THE reader need scarcely be told that albeit police-officers, like other men, chiefly delight to recount their successful exploits, they do, nevertheless, experience numerous and vexatious failures and disappointments. One especially I remember, of which the irritating recollection did not pass away for many weeks. I had been for some time in pursuit of a rather eminent rascal, though one young in years, and by marriage respectably connected, who, by an infamous abuse of the trust reposed in him by the highly-respectable firm who employed him, had contrived to possess himself of a large sum of money, with which, or at least with the portion of it falling to his share—for we discovered that he had been for some time connected with a gang of first-rate swindlers—he hoped to escape to America. The chase was hot after him; and spite of all his doublings and turnings, and the false scents adroitly thrown out by his confederates with the view to favour his escape, I at last fairly ran him to earth at Plymouth, though in what precise spot of it he burrowed I could not for the moment ascertain. Neither was I well acquainted with his features; but in the description of his person furnished me there were certain indelible marks enumerated which, upon strict examination, could not fail to determine his identity. He purposed, I ascertained, to attempt leaving England in a barque bound for New York, which was to sail from Plymouth on the day after I arrived there. Of this I was fully satisfied, and I determined to capture him on board. Accordingly, about half an hour before the ship was to sail, and after all the passengers had embarked, two of the local officers and I got into a boat which I had some time previously engaged to be in readiness, and put off to the vessel. The wind was decidedly fair for the emigrant ship; and so stiffly did it blow from the north-east, that four hands, I was informed, were required, not indeed to convey us swiftly out, but to pull the boat back against the wind, and the strong tide which would be running outside the breakwater. The sea dashed smartly at times over the boat, and the men pulled their sou'-wester caps well over their eyes, to shield themselves

from the blinding spray. We were speedily on board; and the captain, although much annoyed at the delay, paraded his motley passengers as well as crew before us; but to my extreme surprise our bird was not amongst them! Every possible and impossible hiding-place was thoroughly but vainly searched; and we were at length compelled to a reluctant admission that the gentleman we were in quest of had not yet honoured the captain of the *Columbia* with his patronage.

We suddenly returned into the boat; and the instant we did so, the anchor, already afloat, was brought home; the ship's bows fell rapidly off; her crowded canvas dilated and swelled in the spanking breeze, and she sprang swiftly off upon her course. It was a pretty and somewhat exciting spectacle; and I and my companions continued to watch the smartly-handled vessel with much interest till a point of land hid her from our view. We then turned our faces towards Plymouth, from which, I was surprised to find, we were apparently as distant as ever. 'The tide, let alone the wind, is dead against us!' growled the master of the boat, who was now pulling the near oar, in reply to a remark from one of the Plymouth officers. This man had steered on going out. A quick suspicion flashed across me. 'Where is the other boatman who came out with us?' I sharply demanded. The old seaman, instead of replying, turned himself half round towards the weather-bow oar, exclaiming, 'Easy, Billy—easy; let her nose lay a little closer to the wind!' This, I readily saw, was done to conceal a momentary confusion, arising from the suddenness of my question—a very slight one by the by, for the fellow was an old man-of-war's man, with a face hardened and bronzed by service, weather, grog, and tobacco smoke. I repeated the question in a more peremptory tone. The veteran first deliberately squirted a mouthful of tobacco juice over the side, and then with an expression of his cast-iron phiz, which it is impossible by words to convey a distinct idea of, so compounded was it of diabolical squint, lamb-like simplicity, and impudent cunning, replied, 'That wor a passenger to Yankee Land—a goin' there, I'm purty suspicious, for the benefit of his health.' I looked at the Plymouth officers, and they at me. The impudent ingenuity of the trick that had been played us seemed scarcely credible. 'He—he—ho—ho!' rumbled out of the tobacco-stifled throat of the old rogue, 'If he wor somebody you wanted, it wor uncommon well done. Didn't you observe him jump into the main chains of the barkey jist as you wor leavin' on her, and cast us off a minute afterwards? He perferred stoppin' with us whilst you wor rummagin' the hooker—he—he—ho—ho!'

It was useless bandying words with the fellow; and though I felt desperately savage, I had sense enough to hold my tongue. 'Pull smartly,' said one of the Plymouth officers; 'a shot will bring her to yet.'

'Why, ay,' rejoined the imperturbable seaman; 'it mout, if you could get speech of the admiral in time; but I'm thinkin' we shall be a good while yet pullin' in against this choppin' wind and head sea.'

And sure enough they were! More than another hour, by some boatman-craft unexplainable by me, for the sailors apparently rowed with all their might, were we in reaching the landing-place; and by that time all chance of compelling the return of the *Columbia* was long past.

It would be, I knew, impossible to prove complicity on the part of the owner of the boat with the escaped felon, and I preferred to digest the venom of my spleen in silence, rather than by a useless display of it to add to the chuckling delight of the old rascal of a boatman.

We had passed some distance along the quay when one of the local officers, addressing a youngish sailor, who, with folded arms and a short pipe in his mouth was standing in philosophical contemplation of the sea and weather, said, 'I suppose there is no chance of the emigrant ship that sailed a while ago putting in at any other port along the coast?'

The man took the pipe from his mouth, regarded the questioner for a few moments with an expression of contemptuous curiosity anything but flattering to its object, and bawled out, addressing himself to a weather-beaten seaman a few yards off, 'I say, Tom Davis, here's a Blue Bottle as wants to know the name and bearings of the port off the Land's End which the barkey that sailed awhile ago for Ameriker with a north-easter kicking her endways is likely to bring up in: I'm not acquainted with it myself or else I'd tell the gentleman.'

The laugh from two or three bystanders which followed this sally greatly irritated the officer, and he would have indulged in an angry reply had not his more prudent comrade taken him by the arm and urged him away.

'Ay, ay,' said the veteran addressed as Tom Davis, as we were passing him, 'Jim there has always got plenty of jawing tackle aboard; but, Lord love ye, he's a poor dumb cretur at understanding the signs of the weather! He's talkin' about north-easters, and don't see that the wind's beginning to chop about like a bum-boat woman with a dozen customers round her. It's my opinion, and Tom Davis ought by this time to be summut of a judge, that, instead of a north-easter, it's a precious sight more likely to be blowing a sou'-wester before two hours are past, and a sneezer too; and then the *Columby*, if she ha'n't made a good offin', which she is not likely to have done, will be back again in a brace of shakes.'

'Do you think it probable,' I eagerly asked, 'that the *Columbia* will be obliged to put back into Plymouth?'

'I don't know about *probable*. It's not so sure as death or quarter-day, but it's upon the cards for all that.'

'Will it be early in the night, think you, that she will run in, if at all?'

'Ah! there now you wants to know too much; ' said the old seaman turning on his heel. 'All I can say is, that if you find in an hour or so's time that the wind has chopped round to the sou'-west, or within a pint or two, and that it's blowin' the buttons off your coat one after another, the *Columby*, if she's lucky, won't be far off.'

The half-bantering prediction of the old seaman was confirmed by others whom we consulted, and measures for preventing our quarry from landing, and again giving us the slip, were at once discussed and resolved upon. We then separated, and I proceeded to the tavern at which I had put up to get some dinner. I had not gone far when my eye fell upon two persons whose presence there surprised as well as somewhat grieved me. One was the young wife of the criminal on board the *Columbia*. I had seen her once in London, and I knew, as before intimated, that she was of respectable parentage. There was no exultation in her countenance. She had no doubt followed or accompanied her husband to Plymouth for the purpose of furthering his escape, and now feared that the capricious elements would render all the ingenuity and boldness that had been brought into play vain and profitless. She was a mild-looking, pretty woman—very much so, I doubt not, till trouble fell upon her, and wonderfully resembled the female in the 'Momentous Question'; so remarkably indeed, that when, years afterwards, I first saw that print, I felt an instantaneous conviction that I had somewhere met with the original of the portrait; and after much puzzlement of brain remembered when and where. The resemblance was doubtless purely accidental; but it was not the less extraordinary and complete. She was accompanied by a gray-haired man of grave, respectable exterior, whom I at once concluded to be her father. As I passed close by them, he appeared about to address me, and I half-paused to hear what he had to say; but his partly-formed purpose was not persisted in, and I proceeded on my way.

After dining, I returned to the quay. The wind, as foretold, was blowing directly from the south-west; and during the short space of time I had been absent, had increased to a tempest. The wild sea was

dashing with terrific violence against the breakwater, discernible only in the fast-darkening night by a line of white tumultuous foam and spray, which leaped and hissed against and over it.

'A dirty night coming on,' said a subaltern officer of the port whom I had previously spoken with; 'the *Columbia* will, I think, be pretty sure to run in with the tide.'

'When do you say is the very earliest time she may be expected?'

'Well, in my opinion, judging from where she was when I was on the look-out a quarter of an hour ago, not under three hours. Let me see. It's now just upon the stroke of five; about eight o'clock, I should say, she will be here; certainly not before, perhaps much later; and if the captain is very obstinate, and prefers incurring a rather serious risk to returning, it may be of course not at all.'

I thanked him, and as remaining on the bleak quay till eight o'clock or thereabout was as useless as unpleasant, I retraced my steps towards the Royal George Tavern; calling in my way on the Plymouth officers, and arranging that one of them should relieve me at ten o'clock; it having been previously agreed that we should keep an alternate watch during the night of two hours each. I afterwards remembered that this arrangement was repeated, in a tone of voice incautiously loud, at the bar of a public-house, where they insisted upon my taking a glass of porter. There were, I should say, more than a dozen persons present at the time.

The fire was blazing brightly in the parlour of the Royal George when I entered, and I had not been seated near it many minutes before I became exceedingly drowsy; and no wonder, for I had not been in bed the previous night, and the blowing of the wind in my eyes for a couple of hours had of course added greatly to their heavy weariness. Habit had long enabled me to awake at any moment I had previously determined on, so that I felt no anxiety as to oversleeping myself; and having pulled out my watch, noticed that it was barely half-past five, wound it up, and placed it before me on the table, I settled myself comfortably in an arm-chair, and was soon sound asleep.

I awoke with a confused impression, not only that I had quite slept the time I had allotted myself, but that strangers were in the room and standing about me. I was mistaken in both particulars. There was no one in the parlour but myself, and on glancing at the watch I saw that it was but a quarter-past six. I rose from the chair, stirred the fire, took two or three turns about the room, listened for a few minutes to the howling wind and driving rain which shook and beat against the casement, sat down again, and took up a newspaper which was lying on the table.

I had read for some time when the parlour door opened, and who should walk in but the young wife and elderly gentleman whom I had seen in the street. I at once concluded that they had sought me with reference to the fugitive on board the *Columbia*; and the venerable old man's rather elaborate apologies for intrusion over, and both of them seated on the side of the fireplace opposite to me, I waited with grave curiosity to hear what they might have to say.

An awkward silence ensued. The young woman's eyes, swollen with weeping, were bent upon the floor, and her entire aspect and demeanour exhibited extreme sorrow and dejection. I pitied her, so sad and gentle did she look, from my very soul. The old man appeared anxious and careworn, and for some time remained abstractedly gazing at the fire without speaking. I had a mind to avoid a painful, and, I was satisfied, profitless interview, by abruptly retiring; and was just rising for the purpose when a fiercer tempest-blast than before, accompanied by the pattering of heavy rain-drops against the window-panes caused me to hesitate at exposing myself unnecessarily to the rigour of such a night; and at the same moment the gray-haired man

suddenly raised his eyes and regarded me with a fixed and grave scrutiny.

'This war of the elements,' he at last said; 'this wild uproar of physical nature, is but a type, Mr Waters, and a faint one, of the convulsions, the antagonisms, the hurtful conflicts ever raging in the moral world.'

I bowed dubious assent to a proposition not apparently very pertinent to the subject, which I supposed chiefly occupied his mind, and he proceeded.

'It is difficult for dim-eyed beings such as we are always to trace the guiding hand of the ever-watchful Power which conducts the complex events of this changing, many-coloured life to wise and foreseen issues. The conflicts of faith with actual experience are hard for poor humanity to bear, and still keep unimpaired the jewel beyond price of unwavering trust in Him to whom the secrets of all hearts are known. Ah, sir! guilt, flaunting its vanities in high places—innocence in danger of fetters—are perplexing subjects to dwell upon!'

I was somewhat puzzled by this strange talk, but, hopeful that a meaning would presently appear, I again silently intimated partial concurrence in his general views.

'There is no longer much doubt, Mr Waters, I believe,' he after a few moments added in a much more business-like and sensible tone, 'that the *Columbia* will be forced back again, and that the husband of this unhappy girl will consequently fall into the hands of the blind, unreasoning law. . . . You appear surprised. . . . My name, I should have mentioned, is Thompson; and be assured, Mr Waters, that when the real facts of this most unfortunate affair are brought to your knowledge, no one will more bitterly regret than yourself that this tempest and sudden change of wind should have flung back the prey both you and I believed had escaped upon these fatal shores.'

'From your name, I presume you to be the father of this young woman, and—'

'Yes,' he interrupted; 'and the father-in-law of the innocent man you have hunted down with such untiring activity and zeal. But I blame you not,' he added, checking himself—'I blame you not. You have only done what you held to be your duty. But the ways of Providence are indeed inscrutable!'

A passionate burst of grief from the pale, weeping wife testified that, whatever might be the fugitive husband's offences or crimes against society, he at least retained her affection and esteem.

'It is very unpleasant,' I observed, 'to discuss such a subject in the presence of relatives of the inculpated person, especially as I as yet perceive no useful result likely to arise from it; still, since you as it were force me to speak, you must permit me to say, that it appears to me you are either grossly deceived yourself, or attempting for some purpose or other to impose upon my credulity.'

'Neither, sir—neither,' replied Mr Thompson with warmth. 'I certainly am not deceived myself, and I should hope that my character, which I doubt not is well known to you, will shield me from any suspicion of a desire to deceive others.'

'I am quite aware, Mr Thompson, of your personal respectability; still you may be unwittingly led astray. I very much regret to say, that the evidence against your daughter's husband is overwhelming, and I fear unanswerable.'

'The best, kindest of husbands!' broke in the sobbing wife; 'the most injured, the most persecuted of men!'

'It is useless,' said I, rising and seizing my hat, 'to prolong this conversation. If he be innocent, he will no doubt be acquitted; but as it is now close upon half-past seven o'clock, I must beg to take my leave.'

'One moment, sir,' said Mr Thompson hastily. 'To be frank with you, it was entirely for the purpose of asking your advice as an experienced person that we are here. You have heard of this young man's father?'

'Joel Masters?—Yes. A gambler, and otherwise dis-

reputable person, and one of the most specious rascals, I am told, under the sun.'

'You have correctly described him. You are not perhaps acquainted with his handwriting?'

'Yes, I am; partially so at least. I have a note in my pocket—here it is—addressed to me by the artful old scoundrel for the purpose of luring me from the right track after his son.'

'Then, Mr Waters, please to read this letter from him, dated Liverpool, where it appears he was yesterday to embark for America.'

The letter Mr Thompson placed in my hands startled me not a little. It was a circumstantial confession addressed by Joel Masters to his son, setting forth that he, the father, was alone guilty of the offence with which his unfortunate son was charged, and authorising him to make a full disclosure should he fail in making his escape from the country. This was, I thought, an exceedingly cheap kind of generosity on the part of honest Joel, now that he had secured himself by flight from the penalties of justice. The letter went on to state where a large amount of bank-notes and acceptances, which the writer had been unable to change or discount, would be found.

'This letter,' said I, 'is a very important one; but where is the envelop?'

Mr Thompson searched his pocket-book: it was not there. 'I must have dropped it,' he exclaimed, 'at my lodgings. Pray wait till I return. I am extremely anxious to convince you of this unfortunate young man's innocence. I will not be more than a few minutes absent.' He then hurried out.

I looked at my watch: it wanted five-and-twenty minutes to eight. 'I have but a very few minutes to spare,' I observed to the still passionately-grieving wife; 'and as to the letter, you had better place it in the hands of the attorney for the defence.'

'Ah, sir,' sobbed the wife, raising her timid eyes towards me, 'you do not believe us or you would not be so eager to seize my husband.'

'Pardon me,' I replied, 'I have no right to doubt the truth of what you have told me; but my duty is a plain one, and must be performed.'

'Tell me frankly, honestly,' cried the half-frantic woman with a renewed burst of tears, 'if, in your opinion, this evidence will save my unhappy, deeply-injured husband? My father, I fear, deceives me—deceives himself with a vain hope.'

I hesitated to express a very favourable opinion of the effect of a statement, obnoxious, as a few moments' reflection suggested, to so much suspicion. The wife quickly interpreted the meaning of my silence, and broke at once into a flood of hysterical lamentation. It was with the greatest difficulty I kept life in her by copious showers of water from the decanter that stood on the table. This endured some time. At last I said abruptly, for my watch admonished me that full ten minutes had been passed in this way, that I must summon the waiter and leave her.

'Go—go,' said she, suddenly rallying, 'since it must be so. I—I will follow.'

I immediately left the house, hastened to the quay, and, on arriving there, strained my eyes seaward in search of the expected ship. A large bark, which very much resembled her, was, to my dismay, riding at anchor within the breakwater, her sails furled, and everything made snug for the night. I ran to the landing-steps, near which two or three sailors were standing.

'What vessel is that?' I asked, pointing to the one which had excited my alarm.

'The *Columbia*,' replied the man.

'The *Columbia*! Why, when did she arrive?'

'Some time ago. The clock chimed a quarter-past eight as the captain and a few of the passengers came on shore.'

'A quarter-past eight! Why, it wants nearly half an hour to that now!'

'Does it though? Before you are ten minutes older you'll hear the clock strike nine!'

The man's words were followed by a merry mocking laugh close to my elbow: I turned sharply round, and for the first and last time in my life felt an almost irresistible temptation to strike a woman. There stood the meek, dove-eyed, grief-stricken wife I had parted from but a few minutes before, gazing with brazen impudence in my face.

'Perhaps, Mr Waters,' said she with another taunting laugh, 'perhaps yours is London time; or, which is probably more likely, watches sometimes sleep for an hour or so as well as their owners.' She then skipped gaily off.

'Are you a Mr Waters?' said a customhouse official who was parading the quay.

'Yes—and what then?'

'Only that a Mr Joel Masters desired me to say that he was very much grieved he could not return to finish the evening with you, as he and his son were unfortunately obliged to leave Plymouth immediately.'

It would have been a real pleasure to have flung the speaker over the quay. By a great effort I denied myself the tempting luxury, and walked away in a fever of rage. Neither Joel Masters nor his son could afterwards be found, spite of the unremitting efforts of myself and others, continued through several weeks. They both ultimately escaped to America; and some years afterwards I learned through an unexpected channel that the canting, specious old rascal was at length getting his deserts in the establishment of Sing-Sing. The son, the same informant assured me, had, through the persuasions and influence of his wife, who probably thought justice might not be so pleasantly eluded another time, turned over a new leaf, and was leading an honest and prosperous life at Cincinnati.

CARLYLE'S LATTER-DAY PAMPHLETS.

THERE must be few of our readers who have not perused, or at least heard something of the productions of Thomas Carlyle, a man of singular originality and genius, but whose popularity as a writer is greatly damaged by a strange mode of expression, altogether novel in English literature, and which few can thoroughly comprehend. Apart from this unfortunate style of composition, the remarkable thing about Carlyle is an outspokenness of ideas. Perhaps he may be as often wrong as right in his opinions; and doubtless he has propounded more extravagances than any other living writer out of Germany. But then, as every one must see, the man is thoroughly in earnest. He clearly thinks for himself, and says what he thinks—a quality so rare that it is more than apology for all minor imperfections.

In his 'Latter-Day Pamphlets,' now issuing in monthly brochures from the press, Mr Carlyle has undertaken to expatiate in his usual mysterious and fanciful manner on subjects of passing interest, political and social; and the conclusions at which he arrives are for the most part so very absurd—seasoned as they may be with graphic effect, and some degree of force—that one can with difficulty believe the writer to be serious. Serious, however, he is; his whole mind being apparently nerved to the utterance of what he believes to be truths, and no sham. What a rhapsody on the recent outbreaks in Europe is the following:—

'As if by sympathetic subterranean electricities, all Europe exploded, boundless, uncontrollable; and we had the year 1848, one of the most singular, disastrous, amazing, and, on the whole, humiliating years the European world ever saw. Not since the irruption of the northern barbarians has there been the like. Everywhere immeasurable democracy rose monstrous, loud, blatant, inarticulate as the voice of Chaos. Everywhere the official holy-of-holies was scandalously laid bare to dogs and the profane. Enter, all the world, see what kind of official holy it is. Kings everywhere,

and reigning persons, stared in sudden horror, the voice of the whole world bellowing in their ear, "Begone, ye imbecile hypocrites—histrios, not heroes! Off with you—off!"'

After some more to the same effect, he proceeds to say that the 'truculent constable of the destinies' (?) enters and says to the unfortunate monarchs, "Scandalous phantasms! what do you here? Are "solemnly-constituted impostors" the proper kings of men? Did you think the life of man was a grimacing dance of apes, to be led always by the squeak of your paltry fiddle? Ye miserable! this universe is not an upholstery puppet-play, but a terrible God's fact; and you, I think, had not you better be gone?" They fled precipitately, some of them with what we may call an exquisite ignominy, in terror of the treadmill or worse. And everywhere the people, or the populace, take their own government upon themselves, and open "kinglessness:" what we call *anarchy*—how happy if it be *anarchy plus a street constable!*—is everywhere the order of the day. . . . And so, then, there remained no king in Europe; no king except the public haranguer, haranguing on barrel-head, in leading article; or getting himself aggregated into a national parliament to harangue. And for about four months all France, and to a great degree all Europe, rough-riden by every species of delirium, except, happily, the murderous for most part, was a weltering mob.'

What is the use of all this? What would Mr Carlyle be at? Is he a democrat, seeking to extinguish monarchy as a form of government? No such thing; for in subsequent papers he ridicules every species of constitutional or popular government, and seems to aim at a downright despotism. The truth is, that animated with strong impulsive convictions, he for the moment forgets previously-uttered sentiments, and therefore contradicts himself. It is an old charge against Mr Carlyle, that he only exhibits the failings of existing systems, and never comes out with a suggestion of anything better. In this essay, if he makes any positive suggestion at all, it is—that nations should in future be governed by an aristocracy of wisdom, 'captains of industry,' real, not sham rulers. 'The few Wise will have, by one method or other, to take command of the innumerable foolish.' Very good as a proposition in the abstract; but how are we to get at these Solomons? how to insure their due succession once we have begun with them? and, above all, by what practicable means are we to induce the 'innumerable foolish' to become the docile and obedient flocks of these sagacious shepherds? Until Mr Carlyle favour mankind with a business-like recipe how to catch heroes, and set them to work, and more especially how to catch masses of people and indoctrinate them with the feeling of obedience, nations, to all appearance, must be contented to jog on with their present plans of government, and make the best of them.

Fully more extravagant is our author's dream of extinguishing pauperism. Shocked with the 'floods of Irish and other beggars, the able-bodied lackalls,' and other pauper tribes, the British prime minister is to put an end to this army of wretchedness by setting it to work! The cure for all our ills is to be 'Organisation of Labour,' just as that delusion has been exploded in the midst of universal derision. Addressing the army of idle and poverty-struck, the minister is to say, 'My indigent unguided friends, I should think some work might be discoverable for you. Enlist, stand drill; become from a nomadic banditti of idleness, soldiers of industry! I will lead you to the Irish bogs, to the vacant desolations of Connaught now falling into cannibalism; to mis-tilled Connaught, to ditto Munster, Leinster, Ulster, I will lead you; to the English fox-covers, furze-grown commons, New Forests, Salisbury Plains: likewise to the Scotch hill-sides, and bare rushy slopes, which as yet feed only sheep; moist uplands, thousands of square miles in extent, which are destined yet to grow green crops, and fresh butter, and milk, and beef without

limit (wherein no "foreigner can compete with us"), were the Glasgow sewers once opened on them, and you with your colonels carried thither. In the three kingdoms, or in the forty colonies, depend upon it, you shall be led to your work! To each of you I will then say, Here is work for you; strike into it with manlike, soldierlike obedience and heartiness, according to the methods here prescribed—wages follow for you without difficulty; all manner of just remuneration, and at length emancipation itself follows. Refuse to strike into it, shirk the heavy labour, disobey the rules—I will admonish and endeavour to incite you; if in vain—I will flog you; if still in vain—I will at last shoot you, and make God's earth, and the forlorn-hope in God's battle, free of you. Understand it, I advise you!"

Mr Carlyle does not explain how the work given by the prime minister to millions of paupers is to be paid for; how the work on peat-bogs and hill-sides will not turn out to be 'sham work,' under 'phantasm captains,' after all; or how, supposing the thing to be manageable, we are to avoid that inevitable consequence—a very general dependence on such work, which would be equivalent to financial ruin and universal demoralisation? Those who prefer claims as paupers, yet will not work, are first to be flogged; and if that will not dispose them to be industrious, they are to be shot! A happy idea this for quickening a spirit of industry among 'able-bodied lackalls' and downdraughts. Let victims be on the alert, Thomas Carlyle is going to make short work of them!

In the second of the 'Latter-Day Pamphlets,' which treats of model-prisons and the management of criminals, the writer attacks the 'blind pruriency of indiscriminate philanthropy,' and here we are happy to unite in his opinions, however oddly expressed. It may be remembered that, about fifteen years ago, there arose everywhere, in a wonderfully sudden manner, a disposition to view crime with inconsiderate leniency. Those who committed breaches of the law were no longer to be treated with due severity, or huddled up in masses in ill-regulated jails; they were to be confined separately, ministered to tenderly, won back to virtue by sheer love and kindness. Finally, model-prisons were established at vast expense, and the reign of philanthropy and philosophic treatment of vice was begun. The oppressive rates by which these prison-asylums are supported have not been alone concerned in dispelling the fancy, that crime may be extinguished by a few months' seclusion and discipline. Mr Carlyle has caught up this feeling of reaction; and the humour and graphic force with which he alludes to the model-prison system, and the cruelty of making it chargeable on the industrious poor, will probably meet with a general response.

'Several months ago,' he proceeds, 'some friends took me with them to see one of the London prisons—a prison of the exemplary or model kind. An immense circuit of buildings; cut out, girt with a high ring-wall from the lanes and streets of the quarter, which is a dim and crowded one. Gateway as to a fortified place; then a spacious court, like the square of a city; broad staircases, passages to interior courts; fronts of stately architecture all round. It lodges some thousand or twelve hundred prisoners, besides the officers of the establishment. Surely one of the most perfect buildings within the compass of London. We looked at the apartments—sleeping-cells, dining-rooms, working-rooms, general courts or special and private: excellent all, the *ne plus ultra* of human care and ingenuity. In my life I never saw so clean a building; probably no duke in England lives in a mansion of such perfect and thorough cleanness. The bread, the cocoa, soup, meat, all the various sorts of food, in their respective cooking places, we tasted; found them of excellent superlative. The prisoners sat at work, light work—picking oakum and the like—in airy apartments with glass roofs, of agreeable temperature and perfect ventilation; silent, or at least conversing only by secret signs; others were

out, taking their hour of promenade in clean flagged courts: methodic composure, cleanliness, peace, substantial wholesome comfort reigned everywhere supreme. The women in other apartments, some notable murderesses among them, all in the like state of methodic composure and substantial wholesome comfort, sat sewing: in long ranges of washhouses, drying-houses, and whatever pertains to the getting up of clean linen, were certain others, with all conceivable mechanical furtherances, not too arduously working. The notable murderesses were, though with great precautions of privacy, pointed out to us; and we were requested not to look openly at them, or seem to notice them at all, as it was found to "cherish their vanity" when visitors looked at them. Schools, too, were there; intelligent teachers of both sexes studiously instructing the still ignorant of these thieves.'

Then, as a contrast between such places and the dwellings of those on whom is imposed the duty of paying for them—'All around this beautiful establishment or oasis of purity intended for the devil's regiments of the line, lay continents of dingy, poor, and dirty dwellings, where the unfortunate not yet enlisted into that force were struggling manifoldly—in their workshops, in their marble-yards, and timber-yards, and tan-yards, in their close cellars, cobbler-stalls, hungry garrets, and poor dark trade-shops with red herrings and tobacco-pipes crossed in the window—to keep the devil out of doors, and not enlist with him. And it was by a tax on these that the barracks for the regiments of the line were kept up. Visiting magistrates, impelled by Exeter Hall, by able editors, and the philanthropic movement of the age, had given orders to that effect. Rates on the poor servant of God and of her Majesty, who still serves both in his way, painfully selling red herrings; rates on him and his red herrings to boil right soup for the devil's declared elect! Never in my travels, in any age or clime, had I fallen in with such visiting magistrates before. Reserved they, I should suppose, for these ultimate or penultimate ages of the world, rich in all prodigies, political, spiritual—ages surely with such a length of ears as was never paralleled before.'

So far there is room for causticity; but when Mr Carlyle suggests a policy different from the codling practices of late years, he falls into his usual strain of dogmatic wildness. His brief method of dealing with recreant paupers is to shoot them, and his plans for uncriminalising the population are equally severe. Nothing, according to him, like a judiciously-wrought gallows. Evil doers of all colours—white English thieves, and black West Indian idlers, who live on pumpkin, and wont take hoe in hand, are to get their deserts without mercy. 'Beautiful black peasantry, who have fallen idle, and have got the devil at your elbow; interesting white felony, who are not idle, but have enlisted into the devil's regiments of the line—know that my benevolence for you is comparatively trifling! What I have of that divine feeling is due to others—not to you. A "Universal Sluggard-and-Scoundrel Protection Society" is not the one I mean to institute in these times, where so much wants protection, and is sinking to sad issues for want of it! The scoundrel needs no protection. The scoundrel that will hasten to the gallows, why not rather clear the way for him? Better he reach his goal and outgate by the natural proclivity, than be so expensively dammed up and detained, poisoning everything as he stagnates and meanders along, to arrive at last a hundred times fouler, and swollen a hundred times bigger!'

The author winds up the subject with the following paroxysm:—'The ancient Germans, it appears, had no scruple about public executions; on the contrary, they thought the just gods themselves might fitly preside over these; that these were a solemn and highest act of worship, if justly done. When a German man had done a crime deserving death, they, in solemn general assembly of the tribe, doomed him, and considered that fate and all nature had from the beginning doomed

him, to die with ignominy. Certain crimes there were of a supreme nature: him that had perpetrated one of these they believed to have declared himself a prince of scoundrels. Him once convicted they laid hold of, nothing doubting; bore him, after judgment, to the deepest convenient peat-bog; plunged him in there, drove an oaken frame down over him, solemnly in the name of gods and men: "There, prince of scoundrels, that is what we have had to think of thee on clear acquaintance; our grim good-night to thee is that!"

Such writing as this must mainly be allowed to answer itself. It just occurs to us, however, to remark the monstrous fallacy of its one argument—that, criminals having broken the laws of the universe, we, their fellow-men, are called upon to punish them therefore. Those who break the laws of nature are punished by nature (using these terms for the Divine Author of nature); but this is a different thing from our interfering in the case. We only assume the right, as society, to punish offences against society, or otherwise to guard ourselves from these in the best way we can. To come in with an assumption that criminals have defied God, and that we are therefore to exterminate them, would be for the creature impiously to take upon himself the authority and functions of the Creator. It was done by the fanatics of long past ages, and with sufficiently dismal consequences. Could we have dreamt a few years ago that any writer of reputation should, with apparent seriousness, have now been eager and eloquent for the revival of so horrible a practice! Were it worth while, it would not be difficult to show that the somewhat heedless indulgence extended towards criminals of late years furnishes no valid reason for going back to modes of punishment common in the most barbaric times—that the failure of model-prisons only suggests a fresh and calm consideration of the whole question of criminal treatment, as well as of the circumstances which produce a criminal population. How much more gracious and becoming would it have been for Mr Carlyle to have sought out and expatiated on the melancholy causes of delinquency—want, ignorance, parental neglect, natural infirmity, the temptations which prevail in a wealthy and highly-artificial social system, and so forth—instead of indulging in a remorseless ridicule of the well-meant efforts of good men, and uttering cries of vengeance against an unhappy class of his fellow-creatures such as, we venture to say, have not been heard these hundred years!

The third in the series of 'Latter-Day Pamphlets' has 'Downing Street' for its subject; and here the author has full scope for his antipathy to shams. 'What these strange Entities in Downing Street intrinsically are; who made them, why they were made; how they do their function; and what their function, so huge in appearance, may in net result amount to—is probably known to no mortal.' The clearing up of this chaos, and the salvation of the monarchy, are to be effected only by a bold stroke on the part of the sovereign. The crown is to seek out 'gifted and seeing' men, and make them ministers of state with seats, ex-officio, in the House of Commons. Men like Robert Burns are pointed to as the fittest for this high distinction. Poor Burns! to think of spoiling a great poet by making him a statesman!

Of the other pamphlets in the series it is scarcely necessary to speak after the foregoing examples. In the 'Stump Orator,' and also in 'Parliaments,' there are occasionally smart passages; but what is the point driven at? In these pamphlets Mr Carlyle expresses only his aversion to TALK. He speaks of 'a parliament—especially a parliament with newspaper reporters firmly established in it'—as 'an entity which, by its very nature, cannot do work.' . . . 'Consider, in fact,' he says, 'a body of six hundred and fifty-eight miscellaneous persons set to consult about "business," with twenty-seven millions—mostly fools—assiduously listening to them, and checking and criticising them: was there ever since the world began, will there ever be till

the world end, any business accomplished in these circumstances? . . . As a "Collective Wisdom" of Nations, the talking parliament, I discern too well, can never more serve. Wisdom dwells not with stump oratory; to the stump orator wisdom has waved her sad and peremptory farewell.'

What is all this, we would ask any man of common sense, but a condemnation of the right which has been wrought out by English patriotism to discuss its own affairs? Are we to be told at this time of day, that the freedom of discussion is an evil in our state? True, that the talk of parliament consumes much time in proportion to the work done; but is there any real harm in the talk? Is it not, on the contrary, a means of ascertaining the bearings of the proposed measure; at least a means of holding it up in all its various aspects to the free people out of doors, and satisfying them that due consideration has been given to the subject? Parliament, in its very name, implies talk. The kings long ago asked their people for money. 'Well, we must first have a talk about it.' Exactly what any of us would say about any similar demand in private life. In this simple rational idea is the very essence of our freedom—the groundwork of our constitution. After six centuries, during which the efficacy of this right of talk has been continually working towards greater and greater liberty for the subject, are we readily to believe an oracle which tells us that such talk should be put an end to? The best of the joke is, that Mr Carlyle is himself a talker, and nothing else, though employing his pen as the organ of speech. We venture to say that, if he were to intermit this function, and come forth into the arena of that active life where he now sees only fools and knaves, he would go back to his desk in three months with a very different idea of what is required to take part in conducting the affairs of even so partially-enlightened a community as ours!

TINTAGEL, OR THE CASTLE OF KING ARTHUR.

WE are all familiar with the history of King Arthur and his famous Knights of the Round Table, as having formed one of the most wondrous and captivating tales in our nursery library; and it has recently been brought to our remembrance in the vivid and poetic pages of Sir E. Bulwer Lytton. But most of us, perhaps, have regarded the British prince so much as a being of enchanted life, that we have never realised the possibility of his having had a more earthly dwelling-place like any of us common mortals, much less that any remains of his habitation can exist unto the present day; and yet such is the fact, for on the northern coast of Cornwall stands the castle of Tintagel, where King Arthur drew his earliest breath about thirteen centuries ago, and whither he was borne from the field of slaughter at Camallan,* to close his eyes at the advanced age of ninety years.

It was upon a stormy evening of the autumn of 1849 that we arrived at the Stuart Wortley Arms, a humble but very neat little inn in the hamlet of Trevenha; once a borough of some importance, and enjoying many corporate privileges, now a decayed village of limited extent, and of very gloomy aspect. The cottages, which straggle along irregularly on either side of the broad street, are built of a dark slate-coloured stone, of

* The name of Camallan (signifying the crooked stream), close to which is the fatal field where King Arthur fell with all his chivalry, is now changed to Camelford, which at the present day is a small market-town, and has assumed for its corporate arms a camel: the inhabitants being so ignorant of its ancient British derivation as to trace its name to the Oriental beast of burthen—the 'ship of the desert!' Some of our readers may perhaps be interested by the following brief extract from a triad wherein the three men are noticed who escaped from the battle of Camallan:—'In the last battle of King Arthur only three Britons escaped: these were the Strongest Man, the Beautifullest Man, and the Ugliest Man. These three marched through the field un-subdued as gods; and the sun of Britain set, but shall arise again with tenfold splendour when Arthur shall awake from sleep, and resume his dominion over earth and ocean.'

precisely the same hue as their high-pointed roofs; while the windows are few and small, as though the inhabitants cared not to gaze upon the cheerless prospect without: nor truly is there much to invite their gaze; for the hamlet of Trevenha rests upon an elevated tract of barren land, divided into fields by low hedges, whose monotony is unbroken even by a tuft of heather or a bush of gay blossoming furze. King Arthur must have been sorely pressed by his foes when he took refuge in this dreary corner of his dominions.

Our object in visiting Trevenha was to see the ruins of Arthur's celebrated castle; and so, immediately on our arrival, we inquired whether Tintagel lay near the village, and in what direction it was to be found. Our informant having pointed out the road, and told us that it was about a quarter of a mile distant, said that a great many strangers had come to see it this summer; adding, with a smile, 'But it is very strange, ma'am, what different opinions we hear about it: some ladies and gentlemen come back at once, and think there is nothing worth seeing there at all, while others stay there the livelong day, and return again on the morrow, and are never wearied looking at the castle: they say it is so grand!'

We thought to ourselves that in other places besides Tintagel beauty loses its charm, and grandeur its power, in the estimation of those who have no heart to feel the loveliness of the one or to reverence the might of the other.

We stayed not, however, to philosophise on the matter, but hastened along the village street, which was so rudely paved with huge and shapeless stones, that, for aught we knew, it might have been constructed in the days of the great monarch himself. We soon entered a steep rocky gorge, evidently the dried-up course of a wintry torrent, but forming at this time of the year a hollow rocky path, through which a rivulet pursued its peaceful way to the ocean. The pathway was almost precipitous in its descent, and the ground on either side grew higher and higher, until, at an abrupt bend in the ravine, between two bold lofty headlands, the Atlantic opened itself out before us; and on our left, strongly defined against an angry-looking sky, rose up a tall rocky island, with its ruined tower and fragments of dark castellated wall, the only remains of Tintagel, the once-impregnable stronghold of our British monarch. The surging waves were foaming around its base; a solitary seabird stood screaming in tones of dreary lamentation on the narrow ridge of shelving rock which connected the island at its base with the adjoining cliff on the mainland. The narrow chasm had in olden times been spanned by a drawbridge; since then the island, with its antique burthen, has slid down further into the ocean, so that it now stands far apart from the arched portal, by which alone access was given within the walls of the castle. The venerable arch, although partly in ruins, still crowns the cliff; but a single step within its boundary would plunge the intruder into a deep and yawning chasm.

The whole scene conveyed an image of utter desolation; yet by a strange sort of fascination, we stood, as if rooted to the spot, until suddenly a sheet of dark fiery-looking vapour came sweeping towards Tintagel, across the wide western main; and so rapidly did it advance, that before we could ascend many steps of our homeward path, we were absolutely drenched with rain.

Such was our first view of King Arthur's castle, and this momentary glance only made us the more earnestly desirous to visit it at leisure; so the following morning found us once again within the narrow gorge by which alone it can be approached. We hoped to wander about its confines, and trace all its belongings, without let or hindrance from any officious guide or attendant; but to our dismay we saw issuing forth from a cottage, partly concealed amid the rocks, a grave-looking peasant, who introduced himself to us as the tutelary genius of the place, one who knew all about King Arthur, and was familiar with all his haunts—who had been 'scores of times up over the castle,' and was ready to accompany us thither. Now, we must honestly confess that the description given by Carew and other old writers of the perils

incurred in the ascent to Tintagel Rock had somewhat daunted us, so that we purposed only to explore those parts of the ruins which were on the mainland; and expressing this our intention to the guide, begged leave to decline his services. He, however, with the quiet sturdiness of his race, seemed resolved on carrying his point; assuring us there *could* be no danger, for he turned in the sheep constantly to feed on the pasture at its summit; and also that, a few days before, the Duchess of Northumberland had climbed up to the castle quite safely under his guidance. The former argument seemed to us somewhat inconclusive, but the latter was irresistible—for, a duchess having ascended the rock in safety, it would be the height of impertinence for commoners like ourselves to feel any hesitation about following her example. So, casting our fears to the winds, we rapidly descended the rough declivity on the mainland, and then, under the trusty escort of our guide, began the steep ascent to the castle, which Carew has well described as one which, 'through his steepness, threatens the ruine of your life with the failing of your foot.' It was truly a giddy path, for a single false step on the narrow, shelving, shingly path must infallibly have precipitated us into the deep dark waves which were breaking beneath our very feet. 'At the top,' as Carew further expresses it, 'two or three terrifying steps give you entrance to the hill, which supplieth pasture for sheep and conies.' Yes, the area within which we now stood, and which consists of two hundred acres, strewn as it is with scattered vestiges of the renowned Arthur, has for a long while past been chiefly prized as one of the 'best places in the neighbourhood for fattening sheep.' It was a spot full of strange contrasts: the quiet creatures browsing so peacefully upon the soft green sward; a large patch of rushes on the crown of the hill indicating the still gushing life of an abundant spring, from which, many centuries ago, the inhabitants of the castle drew their supply of water; and amid these images of tranquil and present life lay scattered traces of that warrior existence which now dwells only in the memory of the peasant, the poet, or the child—small square chambers, once used as dwelling-apartments; a look-out tower, pierced with loopholes, and overhanging the only accessible part of this dark, stern-looking rock; a low-covered archway, through which a subterranean access might be gained to the sea, thus affording means of escape in case of being sorely pressed by a victorious enemy; the unroofed chapel, only ten feet in length, with its granite altar, its *piscina* ('as the parsons called it,' our guide informed us), and its adjoining burial-ground, whose rude headstones were just seen peeping above the grassy soil. As we stood thoughtfully within these consecrated precincts, we were startled by the screaming of seabirds, which rose up wildly from a tall pointed cliff, called the Needle-Rock, whose summit is on a level with the castle. The sight of intruders had scared them from their resting-place. One could not but feel, as they wheeled their flight above our heads, that they alone were fitting visitants to this mournful spot.

On the southern side of the rock, facing the mainland, is a large slab of stone with an arched rock above it called King Arthur's Seat. On one side of the slab were seen some small round holes, such as are to be found in a billiard-table. Our guide said they were King Arthur's cups and saucers. But we had another attendant, our postilion, who, being an amateur of antiquities, had followed us over the rock, and whose shrewd observations amused us much: he suggested that, more probably, they had been used for some ancient game, adding, 'The gentlemen, I think, might have been very comfortable here with a good bottle of porter!'—a truly British idea, thought we to ourselves, of the nature of 'comfort;' that word so dear to every English heart!

As we stood gazing at the arched doorway, from which we were separated by the broad deep chasm we have already mentioned, our guide pointed out to us a hollow spot in the rock, bearing somewhat the form of a gigantic footmark, and which he averred had been made by the royal foot of King Arthur himself, a corresponding impression appearing on the other side of the chasm. We

listened in becoming silence to this statement, not doubting that our hero had received the gift of seven-leagued boots from his faithful ally the enchanter Merlin; but the wondering postilion, who until this moment had evidently received every statement with the most undoubting faith, said aloud, after a moment's serious consideration, 'Well, I think *that* must be a lie!'

The guide looked aghast at such unbelief. We left the antiquaries to settle this disputed point, and turned our steps towards the rugged descent which lay before us; nor were we ill-pleased to find ourselves once more at its base.

Many a moment did we linger to gaze upon the tall, rugged, iron-looking rock, whereon the earliest of our British monarchs had fixed his fortress-dwelling. On all sides of us were to be seen masses of the same heavy, black stone, rising in lofty crags, or scattered about in misshapen piles. If the age of fairy had not long since passed away, we might have supposed ourselves looking upon some gigantic warriors, who had been transfixed by the wizard Merlin to the spot on which they stood: but such idle dreams are too childish for the enlightened nineteenth century, so we stayed not to indulge in them; but seating ourselves once more in the carriage, returned in the course of a few hours to the busy scenes of social life, amid whose ease and civilisation we shall often love to think upon the stern and lonely towers of Tintagel.

LONDON GOSSIP.

June, 1850.

'WELL, I never!' is an exclamation which you may now hear fifty times a day in the streets as the Nepalese envoy, with his suite, all sumptuously enrobed and glittering with jewels, dash past in their carriage. The simultaneous arrival of these distinguished personages, and the hippopotamus, has flung a dash of enthusiasm into a season which, as I told you in my last, has not been remarkable for sprightliness; and a sudden freshet of wonderings is let loose, 'to crackle a little in talk,' as Bacon says, 'and quickly extinguish.' Among other rumours concerning his highness Jung Bahadoor Koonour Ranage, not the least notable is that of the effectual expedient by which he prevented two ambitious competitors from climbing into his place during his absence from Nepal: he contrived to have one of them shot, and brought the other with him. However, he is of an inquiring mind, and goes everywhere—to the Bank, the Exchange, Houses of Parliament, St Paul's, of course for twopence, and to fashionable gatherings. He was at Lord Rosse's fourth and last soirée, which has just come off, where he tried in vain to comprehend the principle of an electric telegraph exhibited in the rooms, and frankly avowed his inability. Fortunately for his highness he comes just in time to see the last of Smithfield and of intramural interments; for these two moribund contraries will furnish him with an inexhaustible stock of the marvellous wherewith to entertain dinner parties when he gets back to his own country.

As for the hippopotamus, the gentle monster is now safely lodged at the Zoological Gardens, where the curious may view him with his Arab attendant; he—the quadruped, not the biped—is the first living specimen ever brought to England. But all the world are not naturalists—Not a few talk about the building for the great national exhibition, which is to have a dome greater in diameter than that of St Paul's. A suggestion has been thrown out, that when done with for the exhibition, the building, with the ground beneath it, might be converted into a winter-garden. There is one, either finished or nearly so, at Munich, which will cover 40,000 square feet, with double walls of iron and glass to secure equality of temperature, and is to cost £50,000. A sheltered pleasure-ground would certainly be a welcome means of recreation in the bad season. Many, too, are indignant that the aisles and other portions of Westminster Abbey, to which the

public have had free access for the past two or three years, are now again closed. I have frequently enjoyed the solemn pleasure of stepping in from the busy street, and sitting down in some quiet nook to contemplate for a few minutes the 'columns tall' and 'windows richly dight,' and can sympathise with those who consider that national property should not be withheld from the nation. Others are discussing the project of the Commission on water supply. It is not proposed by this commission to derive the needful element from rivers, springs, or Artesian wells, but to obtain a constant service of pure, soft water from Bagshot heath, about twenty-five miles south-west of the metropolis. The heath will form a vast 'catching-ground,' and all the rain that falls on it will be collected and distributed for the use and benefit of Londoners, who doubtless will pray for a speedy realisation of the scheme. Connected with this a little sanitary skirmishing is going on, and in some quarters attempts are being made to train up a youthful army of health by means of a newly-published 'Catechism of Sanitation.' Others have something to say about Phillips's 'Fire-annihilator'—a method of putting out fire without the aid of water. The potent element is a gas. For some time past the inventor has set a house on fire every Friday at the Vauxhall gas-works, in presence of a party of spectators, and extinguished it when in full blaze. I went last week to witness the experiment: the effect was instantaneous; the rushing, roaring flames were at once subdued, and the atmosphere in the building became almost immediately respirable, for persons were able to ascend and walk about in the upper floor. This is so far satisfactory; but the best proof of efficacy would be for the inventor to 'annihilate' the next fire that breaks out here in London. A trial of the process just made in the marshes near Woolwich, under the auspices of the Board of Ordnance, has completely failed.

The Board of Visitors of the Greenwich Observatory have made their annual visitation to that noteworthy establishment. Of all the official scientific duties which devolve on our philosophers and others concerned, there is perhaps none less irksome or more agreeable than this. Those who may or can, go down in the Admiralty barge; those who may not or cannot, avail themselves of other conveyances; and so, in one way or another, the president and most eminent fellows of the Royal Society, and gentlemen of the Admiralty, meet at the observatory to the number of about sixty. The astronomer-royal receives them, conducts them over the establishment, reports progress for the past year, and recommends measures for the future. Refreshments are provided in the shape of chocolate, of first-rate quality, and rusks. When the explanations are over, the Board sits in committee to discuss the heavy business, and then on rising they all go away to the hotel, and dine together; and it would be hard to find through all the season a happier union of astronomy and gastronomy, of philosophy and feeding, ethics and edibles, or a more rational display of post-prandial eloquence. The chief point to be noticed in the astronomer-royal's report on this occasion is, that he hopes to have the observatory connected with our system of electric telegraphs, and eventually, when the submarine wires are brought into play, with observatories on the continent, whereby the determination of differences of longitude, and the verifying of astronomical phenomena, will be greatly facilitated.

Talking of astronomy reminds me, as Ralpho says, of something else. Those who are cunning in works of iron, are interested in Sir Francis Knowles's patent for the production of that metal in a highly-improved form. In blast-furnaces as at present constructed, the ore, the flux, and combustibles are all mixed together; the liberated gases of the fuel injure the quality of the iron, and cause great waste in the shape of slag. By the new process the ore will be kept separate from the sulphureous fuel in a compartment contrived for the purpose, in the centre of the furnace, where it will

be in contact with peat only; and in this way the waste will be avoided, and a quality of metal produced equal, it is said, to the best Swedish, or to that obtained by alloy with scrap-iron. The ore to be used for this purpose is found in Cornwall, where it has long been known, but considered as useless; and close by are thousands of acres of peat; so that if the hopes of the patentee be not realised, it will not be for want of available means. If the anticipated results can be attained, our engineering and architectural capabilities will be essentially increased.

The Royal Society have held their annual meeting for the election of fellows, and have voted fifteen new members into their venerable corporation. It is something to be able to write F. R. S. after one's name, and doubtless the triple quintett are happy in the acquired privilege; whether the dozen non-elected candidates will be equally happy is a subject for speculation. We must all, however, bide our time. The Geographical Society also have had their anniversary, which involves a report of progress, a financial statement, and a dinner—a combination which admits of those who are too late for the first two items being in time for the third. It is usual, also, to award a medal to some one who has contributed to our geographical knowledge, and the society have conferred this honour on Colonel Fremont, who, you will remember, was employed by the United States government to explore Oregon and California in several successive expeditions. The Civil Engineers, too, have made a demonstration in a soirée, at which many extraordinary models and works of art were exhibited. Among others, the first Safety-lamp, made by Davy's own hand: the original of an instrument to which all who warm themselves by coal fires are so largely indebted. It consists of a cork, bearing a small piece of slender wax taper, secured in a small circular wooden stand, and surrounded by the cylinder of gauze, about half an inch in diameter, and five inches long, which fits over the upper end of the cork. Nothing can be more simple than this relic of philosophical insight: it gives us, so to speak, the birth of an idea in a visible form.

Now to look abroad a little:—M. Grange has presented a paper to the French Academy, 'On the Causes of Goitre.' This disease, he observes, 'can be developed in any country, and in all places inhabited by man, except on the sea-coasts; its development being independent of poverty, uncleanness, and hereditary disposition, which are accessory causes able only to accelerate or facilitate the disease.' 'Goitre and crétinism,' he states further, 'have so many relations in common between them, that they are to be attributed to the same cause.' This cause, whereby the thyroidal mass becomes developed, consists essentially in potable waters impregnated with magnesia; goitre appears only on magnesian strata, and is altogether unknown, so says M. Grange, on calcareous, cretaceous, and the Jurassic formations, even though surrounded by districts which may be ravaged by this distressing complaint. As a remedy he prescribes common salt iodurated, in small doses.

It is somewhat remarkable that other investigations bearing on the same subject were communicated to the Academy almost simultaneously with the above. Most naturalists are aware that certain aquatic plants, such as water-cress, contain iodine; but M. Chatin has discovered the presence of this mineral in a wide range of vegetable productions: the shepherd's purse, reed mace, or cat's tail, water radish; the greatest proportion in those growing in running water. We are to consider, it appears, that the plants take in the iodine by absorption, it being derived 'from all points of the terrestrial mass, or it accompanies in some form the chlorates with which it is extracted by the washing of the streams. . . . Hence we have the anti-scorfulous and anti-tuberculous properties of certain plants, and the reason why those growing in running water have generally been preferred. And thus is explained why they are eaten as preventives by people who live in countries where goitre is endemic.' It has been suggested also, that by incinera-

tion of the plants, and washing the remains, a solution would be obtained available for all circumstances and localities. This is, however, a subject to be determined by doctors of medicine, from whom it will doubtless receive due attention. They have a subject before them at present, one that excites some interest—a new remedy for worms, the most effectual yet discovered. It is the *cousou*, an Abyssinian plant. Bruce describes it in his travels. The supply of the article in Europe is very small, and in the hands of one individual at Paris, who demands for it no less a sum than thirty-nine francs an ounce. Now one dose, so the practitioners say, requires an ounce, so as yet the remedy is an expensive one; but in these days of competition and enterprise we shall in all likelihood soon have ship-loads of the article at a moderate cost.

M. Recalcati proposes a method of traction to be applied by the side of rivers, canals, marshy lands, and sometimes to railways. It is to be a small canal, in which a syphon, attached to a locomotive, takes up water, and delivers it through the short leg upon a float wheel which gives movement to the whole apparatus. The utility of this plan is not obvious at first sight, and cannot perhaps be judged of apart from the actual working. Next, M. Daubrée, engineer of mines, describes his process for the artificial production of certain species of crystalline minerals, particularly the oxides of tin, titanium, and quartz. This gentleman had observed that veins of tin are accompanied by fluorides or borates of other minerals—chiefly mica, topaz, tourmaline, axinite, &c. He was led to conclude that the arrangement was not fortuitous, but connected with the active cause of the formation of the deposit. Remarking also that the fluoride and borate of tin are volatile, while the oxide of the metal is fixed, he further concluded that tin may have originally been present in its bed as a fluoride, and that by means of double decomposition the oxide of tin and fluorated minerals were formed. He has succeeded in producing crystals in circumstances very analogous to those of nature, in porcelain tubes brought to a white heat. The process consists in causing a simultaneous current of perchloride of tin, or of titanium—according to the subject of the experiment—and of steam, to pass through. A chlorosilicic current thus combined gave minute crystals of quartz. These experiments are described by competent judges as most successful and satisfactory, and as explanatory of some of nature's modes of working, though they offer no opinion on the theory as to whether the high temperature has been produced by volatilising agents or by electricity. One particular appears to be certain: it is that water has played an important part in the transformation.

Among other scientific notabilia worthy of a passing notice is the publication of a quarto volume by M. Heis of Cologne, entitled 'On Periodical Shooting-Stars and the Results of their Appearances, from Ten Years of Observation at Aix-la-Chapelle.' During this period—from 1839 to 1848—the author observed 2651 of such stars. His theory concerning them is, 'that in each periodical appearance two groups at least of meteors can be distinguished, of which each has its peculiar orbit cutting that of the other at an angle more or less open. One of these groups may be considered as constituted of ferruginous particles in powder or mass, while the other would be essentially formed of sulphur. It suffices to admit that the mutual shock or friction of these meteoric substances generates heat; and hence to comprehend that chemical effects would be the result of certain combinations which might take place beyond the limits of the atmosphere, since neither air nor oxygen is necessary to their production.' In this way all the phenomena are accounted for: a current of iron powder traversing a current of sulphur powder produces the long phosphorescent streaks so often witnessed: a meteoric cloud traversed by iron powder causes the nebulous shooting-stars without nucleus which Quetelet has described. Those luminous stars with tails visible

for a longer or shorter time, are the result of a mass of iron crossing a close current of sulphur; and those without tails, by a similar mass penetrating an isolated cloud of sulphur; and when masses of one and the other come into collision, then we have meteors with a zig-zag, broken course and final explosion. The colours of stars are all accounted for by reference to the density of their constituent elements—heat, force, &c.; and the fact of sulphur showers is not to be set down as apocryphal. These, with some discussion as to the causes of curvilinear and rectilinear motion, are the chief points of M. Heis's work, which will doubtless have its share in the elucidation of the phenomena in question.

To this I may add a passage from a communication lately read to the Royal Society, from Mr Richardson, written last January. 'An astronomic phenomenon,' he observes, 'terrified or arrested the attention of the inhabitants of the whole of this coast some two months ago. This was the fall of a shower of aërolites, with a brilliant stream of light accompanying them, and which extended from Tunis to Tripoli, some of the stones falling in the latter city.'

'The alarm was very great in Tunis, and several Jews and Moors instinctively fled to the British consulate, as the common refuge from every kind of evil and danger.'

'The fall of these aërolites was followed by the severest or coldest winter which the inhabitants of Tunis and Tripoli have experienced for many years.'

In Constantinople also and the south of Europe the winter has been extraordinarily severe, which has given rise to the supposition that the season may have been mild in the north, and that our Arctic explorers will find the sea in a favourable condition for their researches. I have more to say, but must stop short here, and keep the overplus till my next.

DISEASE IN CATTLE.

According to Mr Youatt, 'one-tenth of all the lambs and sheep of our island die annually of disease; of cattle, one-fifteenth of their number die annually by inflammatory fever and milk fever, redwater, hoose, and diarrhoea. If, therefore, one-fifteenth of all the cattle of England are annually lost by disease, more than L.5,000,000 worth of cattle perish every year, and with these also die of disease about L.3,500,000 worth of sheep.' In the same article with the above extract, I find the cause of death in 118 cows reported from the records of medical men, and that 72 of that number died of pleuro-pneumonia. It is to be regretted that there is no further report on this subject, as the six months during which these cases are reported are the ones most likely to have the mortality from fungus taint, being from beginning of May to beginning of November. In consequence of what may be considered the increased mortality of the above six months, I will for calculation take one-half as the proportion of mortality for pleuro-pneumonia. This would make the annual loss from that disease alone L.2,500,000, or, taking McCulloch's estimate of the number of cattle in Great Britain—namely, 5,100,000, take a fifteenth of that as the annual mortality, and again take one-half of that fifteenth as the average mortality from pleuro-pneumonia, and we find 170,000 head of cattle cut off annually by that disease.—*The Farmers' Magazine.*

WIT.

When wit is combined with sense and information; when it is softened by benevolence, and restrained by strong principle; when it is in the hands of a man who can use it and despise it, who can be witty, and something much better than witty, who loves honour, justice, decency, good-nature, morality, and religion, ten thousand times better than wit—wit is then a beautiful and delightful part of our nature. There is no more interesting spectacle than to see the effects of wit upon the different characters of men; than to observe it expanding caution, relaxing dignity, unfreezing coldness—teaching age, and care, and pain to smile—extorting reluctant gleams of pleasure from melancholy, and charming even the pangs of grief. It is pleasant to observe how it penetrates through the

coldness and awkwardness of society, gradually bringing men nearer together, and, like the combined force of wine and oil, giving every man a glad heart and a shining countenance. Genuine and innocent wit like this is surely the *flavour of the mind!* Man could direct his ways by plain reason, and support his life by tasteless food; but God has given us wit, and flavour, and brightness, and laughter, and perfumes, to enliven the days of man's pilgrimage, and to 'charm his pained steps over the burning marl.'—*Rev. Sydney Smith.*

LOVE'S GIFTS.

FAIN would I wreath with pearls
The waving tresses of thy soft brown hair,
Fading to sunlight on thy shoulders fair;
Or throw of glancing gems an iris bright
Blending in thousand hues of fairy light
O'er that rich fall of curls.

Thy snowy arms I'd clasp
With links of gold so light and delicate,
They'd be a symbol of thy love-bound fate;
And gem-lit rings, whose every ray should tell
Some feeling of his heart who loves thee well,
Thy fingers slight should grasp.

But ah! I may not bring
To thee the offerings of magic gold,
Or in an ancient line thy name enfold;
And yet I would not that my gifts should be
Unworthy the deep love I bear to thee,
My joy of life's sweet spring.

Within my mind I'll seek
To form a wealthy treasure-house for thee;
Where pure and noble things thine eye shall see:
The great and good of other times than ours,
The dwellers in far lands and stranger bowers
Again for thee shall speak.

There thou shalt hear and love
The voices of sweet poets of old times,
Sounding so distantly like memory's chimes;
And glorious forms of knight and warrior,
Whose deeds the fervent spirit gladly stir,
For thee shall live and move.

The sea shall offer thee,
Though not her pearls, yet fairer things than they,
Opening her riches to thy mental eye.
And earth her wondrous history shall unfold,
Pictures of ages long gone by, unrolled,
All marvelling thou shalt see.

The stars shall lend their light
To guide us on in nature's wonder-land,
Darting through vistas glorious and grand;
And thus all musically shall arise
For us the harmony of earth and skies
In silent hours of night.

Thus would I cull for thee
The fruits of genius and the wealth of thought,
Those precious things with highest wisdom fraught.
These will be gifts all beautiful and bright,
And emblems meet, in their unfading light,
Of love's eternity.

C. T.

CLOTHES-WASHING IN CALIFORNIA.

I know a person whose wife made a very handsome sum by washing linen whilst her husband was away at the mines. Think of twelve dollars a dozen, eh! Her husband remained absent somewhere about four weeks, and though he came back with a pretty good 'find,' she, good woman, laughed outright at his gold-washing, for her shirt-washing had realised, during the same period, nearly double the value in dollars of the ore he had found.—*Personal Adventures in California.*

WHY IS THE SEA SALT?

Why is the sea salt?

What a question!—and what a time and place for it! You never before sat on turf so green as this, Marion—bordering the yellow sands of a bay so small, so delicately curved, so beautiful, so lonely. See, on one hand, but too far off to disturb the idea of solitude—yet near enough to leave unbroken the ties that connect us with the humanities of life—is a little, rustic, old-fashioned town, clustering itself upon a peninsula which stretches eagerly out into the sea, as if determined to obtain by right the name of an island, which it only enjoys by courtesy. On the other hand are the green, swelling shoulders of the bay, behind which we see rising in the clear air some thin filmy smoke, which tells of the nestling place of that beautiful village, with the most beautiful of names—Aberdour. Behind us, secluding and hemming in our little bay from the world, solemn and austere as the convent walls that enclose some charming nun, is a broad belt of forest, traversed by hermit paths, leading to hidden fountains, holy enough to wash away from the soul the foulest stains of the world. And before us, Marion, look at that expanse of calm blue water, whose ripples kiss the yellow sand at our feet, but whose farther edge is lost in a silvery haze, above which rise dim towers and castled steeps, and beyond them shadowy precipices, and a towering seat where King Arthur himself may seem to look down from his throne upon the world of romance!

But why is the sea salt? Tush! Because it licks up the saline particles of the earth it washes; or because there are mountains of rock-salt resembling colossal lumps of sugar-candy in its depths, which melt so gradually that they and the world will be used up together; or for any other nonsensical reason which the ignorance of science pleases. This is not a time or a place for such fables. But if you will have knowledge, let us take it from the men of old, to whom truth was handed down by tradition. How should we know so well as they who were born so much nearer the event? The venerable Edda tells everything in a page that modern philosophy is breaking its heart to get at. It does not take up a tumbler of the water, and hold it to the light, and boil it, and evaporate it, and pretend to discover the secret from the dregs, like an old woman reading a teacup. It relates the circumstances historically, naming distinctly the individuals and the places, and explaining the reasons and the result. What more would you have? Nothing is wanted on the part of the learner but faith. Listen believingly, and you will understand in five minutes how it came to pass that the water of the sea turned salt.

Before the reign of Frodi, a near descendant of Odin, the ocean was fresh; but that powerful king of Got-

land (called in modern times Denmark) was fond of novelties and experiments. In his dominions there were two millstones, the upper and the nether, forming an engine of extraordinary power, if it had been only possible to set it going. No man, however, was strong enough to turn it; and steam not being yet invented, nor even water or wind power, they stood where they were—vast, ponderous, and motionless, a marvel to the country.

The owner of this mill, whose name was Hengikiapt, which signifies Hanging-Chops, presented it to King Frodi, telling him that it possessed the property of grinding out—grist or no grist—anything and everything ordered by the grinder. But the gift was a mere curiosity, only fit to be put up in some public place to be looked at, and wondered at gratis; for nations had not got the length of charging themselves so much a head for seeing their own monuments. So Frodi was little the better for his acquisition, till he had the good fortune to stumble upon the only individuals in the world who could act as millers to these extraordinary stones. This occurred when he was on a visit to the king of Sweden, at whose court he obtained two female slaves, Fenia and Menia by name, who could do—nobody could tell what they could not do.

As soon as he got home he tried them at the mill, and, lo! round went the huge stones, as if by a hundred horse-power.

'Grind gold!' cried he, and Gotland was at once a California.

'Grind tranquillity!' and every man took the pledge, and subscribed to the Peace Society.

'Grind good-luck!' and Frodi might have been taken for a colonial minister, so prudent, so rational, so prosperous did he become all on a sudden. But, alas! the more he got out of his charmed mill, the more he wanted. 'Grind this! grind that! grind the other thing!' was his constant cry. 'Grind, grind!' when he lay down to rest at night; 'Grind, grind!' when he rose in the morning. He made a rule at last that the female slaves should never rest at one time longer than the cuckoo does between his notes. Then sang the female slaves the famous Grotta song which is still known in Scandinavia. It described the services they performed, the ceaseless fatigue they endured, the sleep that every now and then overpowered them at their task, the pain with which they started from a repose not longer than the intervals between the cuckoo's song.

But Frodi was inexorable in his covetousness. 'Grind this! grind that! grind the other thing!' cried he. 'Grind—grind!' And at length the female slaves, finding remonstrance vain, and warning unheeded, ground war and distress. That very night there landed in Gotland a sea-king whose name was Geysing, who

marched direct upon the palace of Frodi, plundered it of its treasures, slew the unhappy king himself, and carrying off the mill and its slaves, set sail with his booty.

Served him right? True, Marion. The lessons of history are never to be despised. For my part I would have been satisfied with grinding gold, peace, good-luck—

Beauty, fashion, power? True; and health, strength, swiftness—

Polkas, operas, dress? Yes; and love, smiles, kisses—

But why is the sea salt? We are just coming to that. Geysing was not satisfied with his treasures any more than Frodi; and he bethought himself of a very valuable commodity which the Phoenicians—who probably dug it out of the earth—were accustomed to exchange with the British islanders for the produce of their country. 'Grind white salt!' cried he. And the slaves laboured, and the mill turned, and the stream of white salt filled the hold. At midnight they asked their taskmaster whether he had enough: but he ordered them to go on grind—grind—grinding; and by the time they reached the Pentland Firth the white salt covered the decks, and began to rise upon the masts. The cargo was too heavy. The ship dipped, and the water she swallowed made it heavier still. They were now in the middle of the firth. The sky was as black as a pall. A low moaning wind swept over the sea. Geysing was frightened; but he thought she would hold a little more. And so she did; but that was the last. She began to go round and round like the mill, and then settled heavily down in the dark waters; and as she disappeared beneath the surface the grinding still went on, and the unearthly song of the slave women mingled with the cries of the drowning king.

Why is the sea salt? That is why the sea is salt. The mill works to this day. If you will listen at the whirlpool called the Swelchie in the Pentland Firth, you will hear its rumbling amid the roaring of the eddies, and understand how the product of that wonderful mill has by this time salted the whole ocean.

This is the only true original legend of the salting of the sea: the others are counterfeits, manufactured by unprincipled monks in the middle ages, who ought to have been prosecuted.

A specimen of their manufacturing, Marion?—of such trash? You are as exacting as Frodi or Geysing either: but if you will have it, here goes.

* Once on a time there were two brothers, one rich, and one poor; and when it came to pass that all men were preparing the Yule feast, the poor brother found himself without a mouthful of food in the house or a penny to purchase it. In this extremity he laid his case before his rich brother, and besought him to give him something, that he and his wife might have wherewithal to make their Christmas meal. The rich brother looked sourly at him, and seemed about to refuse; but at length he tendered him a shank-bone of ham, on condition that the other would do whatever he should desire of him. The promise was made; and then his benefactor, giving him the shank-bone, told him with a bitter smile to go to—

Hush, never mind? Very well. The poor brother went away in dismay, thinking he had far to go, and he asked everybody he met the road to *hush*! The place was not so far off, however, as he thought, nor the way so difficult to find, and he met with many obliging per-

sons who were very willing to direct him. When the shades of evening began to descend, he reached an immense palace illuminated from top to bottom, and he said to himself, Surely this is the place? He was right: for in a shed close by there was an old man with a long white beard splitting wood for the Yule feast, and he told him, in reply to his question, that that was assuredly his destination.

'Go in boldly,' said he, 'for you are not empty handed: you will find many there anxious to buy your bone, and to give a good price for it; but take care that you accept of nothing in exchange but the mill behind the door.'

The poor man accordingly knocked, the door flew open, and a whole legion of the inmates crowded round him, bidding eagerly for his bone.

'Alas!' said he, 'it is the only thing I have that I can call my own; and it was intended to furnish a dinner for my wife and myself to-morrow. But if you must have it you shall, provided you give me in exchange that hand-mill behind the door.'

The gentlemen were at first surprised, then indignant, then grieved. They were free traders. It was their business to buy in the cheapest, and sell in the dearest market they could; and although determined to have the shank-bone, they were loath to make so valuable a return. The poor brother, however, was as resolved as they; and the end of it was that the arrangement he insisted upon was agreed to, and he carried away the mill.

'Now what shall I do with this?' said he to the old man as he passed.

'Make it grind you your dinner, or anything you will,' replied the old man.

'And how am I to stop it when I have done grinding?'

'That way!' and he showed him the secret.

It was late ere he got home with so heavy a load; and placing it on the table, he sat down exhausted, and began to wipe his brow.

'And is this all you have got?' said the wife, uncertain whether to scold or to cry. 'What has detained you so long? Did you not know that I had not even two chips of wood in the house to lay across the hearth to boil the Yule pudding? What is the use of a mill with nothing to grind?' In reply to this, her husband merely turned round the mill, ordering what he wanted; and first came out a pair of candles, then a tablecloth, then meat, then beer, and in short everything requisite to furnish a feast.

The wife was amazed, and questioned and cross-questioned her husband about the miracle; but the difficulties in her pursuit of knowledge were insuperable: all his conversation was addressed to the mill, and it was in the words of Frodi—'Grind this! grind that! grind the other thing!' In three days they had a whole houseful of comforts and luxuries; and they then sent to invite their friends and relations to a banquet. When the rich brother came he was ready to expire with envy.

'Where in all the world have you been?' said he.

'I have been behind the door!' replied his brother; and that was all he could get out of him. The other importuned him to sell his mill, coming day after day, and increasing his offer, as he saw it grinding all manner of things; till the possessor, tired of turning it, appeared to relent; and he at length sold the wonderful mill for a large sum of money.

It was night when the mill was delivered to the

rich brother, who on the following morning told his wife to go out and spread the hay after the reapers, promising to prepare breakfast himself. Her back was no sooner turned than he shut the door, placed the mill upon the table, turned it violently round, and trembling with expectation, commanded it to grind herrings and porridge. And the herrings and porridge came till every dish in the house was full. Then the stream overflowed the table, and then the floor; the unskilful miller turning the handle in every possible way to endeavour to stop it. All was to no purpose. On flowed the torrent; and when, afraid of being drowned in the kitchen, he rushed into the parlour, it followed him there, and he had barely time to escape by the window, pursued by an ocean of breakfast. He never stopped till he reached his brother's house.

'Take it back!—take it back!' cried he, 'or the whole parish will be suffocated in herrings and porridge!'

'What will you give me if I take it back?'

A bargain was made; and the cunning grinder, who had foreseen this result, was now a rich man, and had the mill to boot. He built him a house—or rather a palace—on the sea-shore; and in the wantonness of his wealth covered the walls with plates of gold, till it shone far out to sea.

Among the mariners who sailed in near the shore to see this marvel was one whose trade it was to peril his life in carrying through dangerous seas the rock-salt that was then so valuable a commodity.

'Can your mill work salt?' said he.

'That it can,' replied the man of the golden palace. Whereupon the mariner bade higher and higher for the treasure, till its owner reflecting, like a sensible person, that he had already a superfluity of the good things of the world, and that a mill manufactured in a certain place of evil repute must at one time or other work evil to the grinder, consented to sell it for a very large sum of money. The new purchaser, overjoyed at his success, and laughing in his sleeve at the simplicity of the seller, carried off his prize at once, and was no sooner on the open sea than he set up the wonderful mill, and turning it quickly round, commanded it to grind salt. I need not add, Marion, that it obeyed only too well; that it continued to obey long after the bones of its luckless owner were bleaching at the bottom; and that at this moment it still keeps grinding, grinding, with such effect that, notwithstanding the rivers of fresh water it receives, the sea remains salt, and will remain salt for ever.

Not so good as the other? No more it is: but there is a gleam of truth here and there in it for all that. Do you not think, dear friend, that there are times and places when the faith is young and strong—when giants are not monsters, fairies not preternatural, and talismans not impossible? Do you not sometimes feel as if, like the goddess of old, you had bathed in the Fountain of Youth, and returned to the thoughts and associations of your unwithered years? Believe me that fountain is no dream of poetry, no invention of romance. Its waters float in the air you even now inhale; they cool your fevered brow; they reanimate your drooping heart; and, seen through this enchanted medium, the lovely picture before us is a realisation of the visions that once haunted your young bosom of the distant world. But a shade has fallen upon the scene: a stronger breath ruffles here and there, as if with a dream, the slumbers of the Firth; the distant city looms out more sternly from the opposite shore; the clustering

houses on the left have a colder, sharper look; and the filmy smoke of Aberdour rises in heavier masses from the hill. Yes our cloudland is descending, and we with it—but slowly, gently—to mingle with the material earth. Come: our way lies through these forest-paths. But as we go, let us pause every now and then to enjoy a farewell glimpse of the view through the opening trees, to inhale the rich breath of the hawthorn where it hangs over our path, to listen to the trickling waters by our side, and to that faint song from some viewless chorister of the grove,

'And watch the dying notes, and start, and smile!'

But now, Marion, our descent is complete; we have fairly reached the surface of this breathing world, and must forego all these enjoyments to quicken our pilgrim steps.

Why so? Because we shall otherwise be too late for the steamer at Burntisland.

BARON REICHENBACH'S RESEARCHES.*

THE Researches of Baron Reichenbach, which were first made known to the British public about four years ago, in a pamphlet edited by Professor Gregory, are now detailed at full length, and with later additions, in a volume translated from the author's original papers by the same editor, who has prefixed to them an able vindication of Reichenbach's method of procedure. The experiments relate to an influence possessed by material bodies, distinct from any of the forces recognised in physical science, and hitherto unnoticed in the world except among the questionable proceedings of imposture and superstition. The new influence has hitherto escaped detection from its feebleness, or rather from the absence of sensibility to its effects among the great majority of mankind. But if the speculations of Reichenbach be well founded, it is the cause of at least one universally-discerned appearance—namely, the aurora borealis, which has never been accounted for by reference to any of the other natural agencies.

It is not surprising that we should be incredulous about the existence of a power whose effects are revealed only to an individual here and there, such individuals for the most part labouring under diseased nervous sensibility. We are not unwilling to trust to other people's senses in cases where our own senses can recognise the same kind of appearances; but to believe in the existence of what we are utterly incapable of perceiving, is a severe exercise of faith. At all events, we are entitled to require that the evidence should be of the most indubitable kind that the case admits of; we ought to have the very highest security for the good faith of the witnesses. Now, the characteristic distinction of the present investigations is their being conducted by a man of science according to the very same strict rules and methods as have been applied so successfully to the determination of regular laws in other departments of nature. On this point, from the attestations of Professor Gregory, there can be no sort of doubt.

In a previous number of this Journal† we called attention to this subject by presenting some extracts

* Researches on Magnetism, Electricity, Heat, Light, Crystallisation, and Chemical Attraction, in their relations to the Vital Force. By Karl Baron Von Reichenbach, Ph. Dr. Translated and Edited, at the express desire of the Author, with a Preface, Notes, and Appendix, by William Gregory, M.D., F.R.S.E., Professor of Chemistry in the University of Edinburgh. London: Taylor. 1850.

† No. 115, new series.

from the 'Dublin Quarterly Journal of Medical Science' of that day, which gave an abstract of Reichenbach's first paper. As the author has since then not merely amended that paper, but has published a second, embracing a wide extension of his researches on one part of the subject, we are enabled now to offer a much more full and explicit account of the new department of science thus called into being.

We shall first quote the author's own statement of the primary observation lying at the root of his researches:—

'The time-honoured observation, that the magnet has a sensible action on the human organism, is neither a lie, nor an imposture, nor a superstition, as many philosophers now-a-days erroneously suppose and declare it to be, but a well-founded fact, a physico-physiological law of nature, which loudly calls on our attention. It is a tolerably easy thing, and everywhere practicable, to convince ourselves of the accuracy of this statement; for everywhere people may be found whose sleep is more or less disturbed by the moon, or who suffer from nervous disorders. Almost all of these perceive very distinctly the peculiar action of a magnet, when a pass is made with it from the head downwards. Even more numerous are the healthy and active persons who feel the magnet very vividly; many others feel it less distinctly; many hardly perceive it; and finally, the majority do not perceive it at all. All those who perceive this effect, and who seem to amount to a fourth or even a third of the people in this part of Europe, are here included under the general term "Sensitives."'

The sensations thus perceived are of two kinds. One kind are analogous to the feelings of heat and cold, but not identical with these. A *cool* magnetic feeling is at the same time refreshing and comfortable, a source of the greatest delight and enjoyment to the sensitive patient. It is like a fresh cooling breeze after the oppression of sickly warmth, and is evidently of the nature of a wholesome genial stimulus to the whole nervous system. The nervous current which it induces must be in the same direction as the currents that sustain the vital functions; it is, in fact, a reinforcement of the living energies dependent on the nervous system. The feeling of *warmth*, on the other hand, is a feeling of a distressing and uncomfortable kind. It seems connected with an action against the grain, an obstruction to the healthy stream of life. When intense and continued, it produces a severe sense of oppression and stupefaction, going on to fits and convulsions, and giving all the evidences of being extremely unfavourable to the human system. The apparent warmth is thus a sickly, oppressive, and unwholesome warmth, and every sensitive person requires to be protected from the peculiar influence that imparts it, and to be subjected if possible to the influence that causes the opposite feeling of refreshing coolness.

The second class of sensations are those of sight, including luminous flames, sparks, smoke, glow, and varied colours. Sensitive persons can in a dark room see all these appearances about a magnet, or any of the other bodies that have the same power. Baron Reichenbach has investigated these luminous effects with such an amount of care and precision that he can render a distinct and accurate account of each of them; and some of his results we shall be able to lay before our readers.

With reference now to the objects causing these two classes of sensations, the foremost, as already observed, is the magnet in all its forms—natural loadstone, artificial magnet, electro magnet, and lastly, the earth.

If we take a *magnetic bar*, and present the north pole to the body of a sensitive person, and with that pole make downward passes from head to foot (withdrawing the magnet when raising it again, so as to avoid an up-

ward pass), we shall produce the cool and comfortable sensation; we thereby communicate a nervous current, genial and favourable, to the powers of life. But if with the same pole we make exclusively upward passes, we produce the warm and oppressive sensation, or engender a conflict with the healthy activities of the system. This pole, the so-called north pole of the magnet, because its magnetism is the same as the north magnetic pole of the earth, Reichenbach proposes to call *negative*, as respects the new force, the cause of these sensations. If the south pole of the magnet is used, the effects are exactly opposite: the downward pass is warm, the upward cold, and the pole is denominated the *positive* pole as regards this action. The force itself has been termed *ODYLE* by the author of these researches—and consequently north magnetism he styles *odylo-negative*; and south magnetism, *odylo-positive*.

Such are the respective sensations made by moving up and down the two poles of the magnet. We have no reason to be surprised at this effect after what has been already established on the subject of magnetism. It was a fact ascertained by Faraday, that if a magnet is moved along a wire, it will induce a current of common electricity in that wire; and knowing, as we do, the susceptibility of the human nerves to electric currents, we cannot but admit the possibility, and even the unavoidableness of imparting electric currents to the nerves by magnetic passes. But here the parallelism ceases. Motion is essential to the production of electric currents by a magnet; motion is not essential to the production of odylic sensations, pleasurable or painful. Odylo, therefore, cannot be mere electricity caused by induction from a magnet: it is a power arising from a magnet in circumstances where electricity is not developed. For this, as well as for many other reasons, the new force, although inherent in all magnets, is not magnetism as usually understood; it is not the force that enables magnets to attract iron, and to develop electric currents by Faraday's magneto-electric machinery.

We have said that magnets exert the odylic power even without being passed up and down; the following are the facts to prove the assertion:—If a magnet is placed in the right hand of a sensitive person, it produces one or other of the two sensations according to the direction given to it: if the north pole points up the arm, the cool agreeable sensation is felt; if the south pole is so placed, the feeling is of the warm and painful sort. The earth's magnetism likewise affects the feelings of odylic sensitives. Their most agreeable position in bed is with the head to the north and feet to the south; a less agreeable position is with the feet to the north and the head to the south; but it seems that the worst position of all is with the head to the west and the feet to the east. This peculiarity is in part explained by the constitution of the human body itself in reference to odylic currents. It will be seen afterwards that the human system is one of the sources of odylic power, and that the two hands are the points where the power is strongest. An axis of power lies across the body, having the two hands for its poles, and the circulation by this axis is more intense than by the axis of the body itself from head to foot. Now when the patient lies west and east, the right hand is towards the south and the left hand to the north; but this is in opposition to the directions that give the pleasant feeling, for the right hand ought to be north and the left hand south. It must, however, be admitted that this portion of the subject, with reference to the concurrence of the currents from a magnet without and from the body within, is not made so clear as could be desired.

To show decisively that it is not to magnetism exclusively that this new force belongs, Baron Reichenbach proceeds next to point out the efficiency of *crystals* in causing the same feelings and sensations. When he took a large crystal of a pure and homogeneous structure—calcareous spar or rock crystal, for example—and

stroked a sensitive person with it, the same feelings of coolness or warmth were produced according to the end used. When laid in the hand of an extremely susceptible patient, it excited involuntary contraction, attracted the hand, caused it to become clenched, and to grasp the crystal with a spasm. The line of force lies along the optic axis of the crystal, and the opposite ends of the axis have opposite polar effects. Thus the odyle force is something common to magnets and pure crystals. Irregular crystals, such as granular crystalline limestone, compact quartz, or loaf sugar, are inert, evidently in consequence of their irregularity; that is, they are made up of a mass of small crystals not in line, but pointing in all directions, and having thus no one uniform axis of power. The evolution of light during the process of crystallisation is a fact long recognised by chemists, and may be connected with the luminosity which they present to sensitive patients.

The property of crystallisation being thus associated with odyle manifestations, it became desirable to ascertain if there were any other of the permanent peculiarities of material bodies that yielded the same power. After experimenting with many hundreds of different substances, the author came to the conclusion that *bodies possessed of strong chemical affinities* had, by virtue of this endowment, odyle characters. The odyle power is thus a pretty general property of matter, associated in the first place with the crystalline structure, and in the second place with the chemical character of bodies. Crystals, like magnets, are *polar*—each individual crystal having both kinds of force lodged within itself: but the bodies that act in virtue of their chemical affinities possess only one of the kinds. It is to be remarked that this new force, associated with crystallisation and chemical affinity, is manifested while these powers are dormant. It seems to inhere, like gravitation, in dead matter; forming a contrast to heat, which is not produced except by a course of rapid changes in the structure of bodies.

This last remark is needed to clear the way for the exposition of the other sources of odyle which we have now to allude to—namely, *heat, light, electricity, and chemical and vital action*. These properties belong to matter, not its dead inactive state, but in the changes that it undergoes, and during the progress of those changes.

According to Reichenbach, a body heated above its natural temperature communicates the cool sensation, while ice produces in an intense degree the warm unpleasant feeling. There is thus a marked contrast between the ordinary sensation of temperature and the extraordinary sensation developed in addition, and felt by sensitives to the magnetic and crystalline force.

Light has the same effect as high heat: it produces coolness. On this head the author gives the following experiment:—'When in bright daylight I brought a lighted wax candle near to Mademoiselle Maix, she perceived a peculiar coolness caused by it. Several candles increased this coolness, so that it pervaded her whole person. I removed, step by step, the candles to the end of two adjoining rooms, together twenty-four feet long. The coolness was at this distance much diminished, but still in some degree perceptible. She described it as obviously analogous to that produced by a wire, the end of which was in sunshine. This observation, which to herself was quite unexpected, led her to remember that, in attending certain ceremonies of the Catholic church at certain periods, and which consist in powerful illumination at night by means of hundreds of wax candles—as in the illumination of the representation of the sepulchres of saints, &c.—she had never been able to hold out. The lights had invariably so chilled her—to the marrow of her bones, as she expressed it—that she was compelled to leave the church. Now, Mademoiselle Maix has suffered during nearly the whole of her life, in a less degree, from the disease which has now become so severe, and is to be regarded as a born sensitive, who

was subject to the sensations peculiar to that state at every period of her life, even when she seemed healthy, and was able to walk about. This peculiar effect on her of light from distances at which the radiant heat could only have been very feeble indeed, producing, besides, an action on the nerves exactly opposite to that of heat, was strongly felt by her at all times, and at a period when no one suspected that it could indicate any morbid state.'

Knowing the connection between magnetism and *electricity*—they being in fact one and the same power in different circumstances—it was to be expected that both would have like properties in reference to odyle, and accordingly such was found to be the case. Electrified surfaces produced the same feelings as magnets, crystals, &c.

The same remark applies to *chemical action*, which, being a source of heat, electricity, and magnetism, is therefore in all probability a direct agent in causing odyle effects. On the experiment being made, the fact became apparent beyond a doubt.

'To determine this point,' says the author, 'I took a glass of water, dissolved in it bicarbonate of soda, introduced the end of a copper wire five feet long into it, gave the other end to Mademoiselle Maix, laid a pinch of powdered tartaric acid on the edge of the glass, and when her hand was accustomed to the wire, sprinkled the acid into the solution. As soon as the decomposition began, the same sensation of warmth, followed by coolness, was perceived as when I touched the end of the wire with my ten fingers, with the point of a large crystal, or with a bar magnet. It became so strong that it produced flushing of the face. It continued uniformly as long as the action lasted, and ceased when it stopped.'

Having satisfactorily determined the odyle power of chemical action, the author introduces the case of *vital action*, and shows that odyle is developed in the processes of digestion and assimilation. By its connection in this manner with the blood, he explains the influence of the human hand upon sensitive patients, which, at a very early period of his researches, he had found to possess the same powers as the magnet and crystals. By making passes with his right hand, he could produce the very same effects as with the north pole of a magnet; likewise the luminosity apparent at the extremities of the magnet was observed streaming from the fingers of any person in the room. In some persons the odyle force of the hand is much more powerful than in others, no doubt depending on the totality of the chemical and vital processes going on in the system, and to some extent measuring their energy. It was found that the odyle force of an individual varied greatly from time to time, and went through a regular series of variations every twenty-four hours; being greatest two or three hours after noon, and least at the corresponding hour in the night. The author exhibits those variations in a curve, and endeavours to draw inferences from them as to the proper hours of eating, working, and sleeping.

We must, however, pass on to the remaining sources of odyle—namely, the sun, moon, and stars. The *sun* is found to give the odyle-negative or cooling influence, while the *moon* gives the warm disagreeable influence. As lunatics are of all other persons the most susceptible to odyle, the baron has no difficulty in ascribing to its influence the action of the moon on this class. From the contrasted peculiarities of the sun and moon, coupled with some direct observations on the influence of the starry sky, he makes a generalisation to the effect, that bodies shining by their own light—such as the *stars*—are odyle-negative, or cool and agreeable; while bodies shining by reflected light—as the *planets*—are odyle-positive. But light in general, as has been seen, including artificial lights, has odyle power.

For the present, we can only further advert to the transmissibility of odyle by wires, and the surfaces of many substances. A glass of water can be charged by a magnet, by the hand, or simply by standing in the

light. The influence, subtle as it is, is also found to be liable to the same laws of radiation as heat. These are curious facts, and seem to point to strange mysteries connected with the human constitution which remain to be found out.

RESIDENCE OF ADAM SMITH.

MANY who hear of the great economical work of Dr Adam Smith know little of its history, or of the character and circumstances of its author.

Very unlike the literary productions of modern days, it was the result of *ten years' labour*. It was not merely written during ten years of a man's life, the product of occasional application or of leisure hours. Smith, who was a quiet bachelor, living with an aged mother, and wholly a being of study, retired from the busy haunts of men to write this book, and was *completely occupied by it* for ten years. Such, we suspect, is the true way to make great books and consequently great and enduring reputations.

The retreat of Smith during these ten years was his mother's house, in the seaport town of Kirkcaldy, on the north shore of the Firth of Forth, opposite to Edinburgh. He could here see the busy capital, where lived his friends Hume, Blair, Robertson, and others; but he seldom went thither. Having been born in Kirkcaldy and brought up at its grammar school, he had some old friends of youthful days there, and with them he maintained a little intercourse. Beyond this he was almost a hermit. The space occupied by his remarkable labours was from the year 1766 to 1776, when the work was published, at which time the author was fifty-three years of age.

A stranger, passing through the long rambling town of Kirkcaldy, will very probably observe, inscribed over an entry or alley, 'DR ADAM SMITH'S CLOSE.' He may here see the house, and even the room, where this great work was concocted. About twenty years ago, the following account of the residence of Smith was written by a gentleman of Kirkcaldy in obedience to an inquiry which had been addressed to him:—

'The house in Kirkcaldy which was inhabited by Dr Smith, his mother, and Miss Douglas, a cousin, is a house of three storeys, situated on the south side of the street (nearly opposite the shop of Mr Cumming, bookseller), now the property of the heirs of Michael Beveridge, haberdasher. About the centre of the front is a close or entry by which you pass in ascending to the second and third storeys. At the extremity of the close is a large court or open area in rear of the house. On the east or left side of this court is a building at right angles to the front building, locally denominated a *back jamb*. This back jamb contains the staircase by which you ascend to the second and third storeys, and also several apartments. Dr Smith occupied the third storey of the house, and his study was the southernmost room of the back jamb, a room I estimate (I visited it to-day) about fourteen feet by ten, having one window looking into the back court, and another in the gable or south wall of the back jamb looking towards the sea. The fireplace is in the gable. Between the fireplace and the side of the window is a space of about three feet: there stood the doctor's chair; and here he sat by the fire, the one knee over the other, reclining

his right shoulder against the wall, dictating his immortal work to his amanuensis, Rob Reid, who sat on the opposite side of the fireplace at a small table fronting the doctor. Dr Smith wore a tie-wig, and when sitting in the position I have described, in deep meditation, he frequently leaned his head against the wall, by which, in process of time, the paper of the wall became stained by the pomatum on his wig. This stain or mark remained on the wall for many years after Dr Smith left Kirkcaldy, but is now no longer visible. The house became the property of Andrew Cowan, merchant in Kirkcaldy, who carefully preserved the greasy mark upon the wall during his life. After his death the property passed into the possession of one who, though he knew sufficiently well the practice of amassing wealth, knew little of the principles developed in the "Wealth of Nations," and cared as little for this curious relic of its celebrated author. The room has been divested of its antique papering, and along with it the greasy mark of the philosopher's wig. The curious old mantelpiece has been replaced by one of more recent fashion, and the room itself is disjoined from the third storey by a partition; the entrance to it is now by a stair from the second storey.

'I cannot say I ever saw this mark myself, but several gentlemen who knew Dr Smith, and who were well acquainted with the position of the mark, have pointed it out to me as I have now described it. I have some doubt that Mr Fleming has been deceived by his memory in stating that he has *seen* the mark. I have a distinct recollection of having visited the room a number of years ago along with the late James Sibbald, M.D., and some others, of whom perhaps Mr Fleming was one, when we attempted a subscription for a bust of Dr Smith, which, to the disgrace of Kirkcaldy, could not be effected, and at that time I know the mark was obliterated.

'I presume you are aware that Dr Smith's father was comptroller of customs in Kirkcaldy. His mother was of the family of Douglas of Strathenny in Fife, and the doctor stood in the relation of grand-uncle to the present Robert Douglas, Esq. of Strathenny. He received the rudiments of his education at the grammar school of Kirkcaldy, under the tuition of David Millar, a celebrated teacher of that period. A gentleman now in Kirkcaldy, whose father was a class-fellow of Smith's at Kirkcaldy school, states to me, on the authority of his father, that when at school he displayed no superiority of intellect to his contemporaries, but his mind always kept hold of whatever it acquired; that he never cordially joined in any of the pastimes or youthful frolics of his schoolfellows, but after school hours went his way quietly home. Whether this proceeded from a natural disinclination to schoolboy amusements, or whether his delicate constitution prevented him from taking part in the games of his more robust schoolfellows, my informant cannot say. It was during the time that he was professor of moral philosophy in Glasgow that he composed his *Theory of Moral Sentiments*. He left his chair in Glasgow to travel with the Duke of Buccleuch (grandfather of the present duke), who settled an annuity on the doctor. It was after his return from the continent with the duke, and before his appointment in the customs, that he composed his "Wealth of Nations." It is generally understood that he contemplated this work some years before this period, and had digested an outline of his subject; but when he came to prepare the work for the press, he found it would be more convenient to have an amanuensis to

* The original letter from which these extracts are made has been found among the papers of a lady lately deceased. Being without an envelope, we know not to whom it was addressed. It may have been published before, but we deem this not likely.—Ed.

transcribe for him. For this purpose he engaged Robert Reid, a weaver in Linktown, to attend him in the evening, after he had finished his daily labour at the loom. In pursuance of this plan, Rob, who wrote a fair hand, attended the doctor in the evening, and wrote out the cogitations of the day. To give you some idea of the care and attention bestowed by the author upon his subject, I am informed by a gentleman here that Rob Reid has assured him that he (Reid) "is certain that he wrote the 'Wealth of Nations' fifty times over before it was printed." Making even a large allowance for exaggeration in this assertion, sufficient remains to prove that the author had been at very great pains to render the work complete; and the character of the work justifies the pains he had taken.'

Dugald Stewart, in his memoir of Smith, relates a curious anecdote of his infancy. 'An accident which happened to him when he was about three years old, is of too interesting a nature to be omitted in the account of so valuable a life. He had been carried by his mother to Stratherry, on a visit to his uncle, Mr Douglas, and was one day amusing himself alone at the door of the house, when he was stolen by a party of that set of vagrants who are known in Scotland by the name of tinkers. Luckily he was soon missed by his uncle, who, hearing that some vagrants had passed, pursued them with what assistance he could find, till he overtook them in Leslie Wood, and was the happy instrument of preserving to the world a genius which was destined not only to extend the boundaries of science, but to enlighten and reform the commercial policy of Europe.'

It is not unworthy of remark, that Smith was one of the many instances which could be brought forward against the too gallant theory that men possessing extraordinary genius are chiefly indebted for it to their mothers. While the mother of Smith was an ordinary woman, the talents of his father had been evinced by his being raised from the duties of an ordinary writer to the signet to be private secretary to the Secretary of State for Scotland. The father, however, having died before the son was born, Smith was indebted to his mother for the care which brought him through a sickly infancy, and for much domestic happiness during the long period of sixty-one years that she was spared to him.

Adam Smith enjoyed the dignified situation of a Commissioner of the Customs in Scotland for the last fifteen years of his life, and during this time he lived in Edinburgh. The house he occupied still exists in the Canongate, but is much altered, besides being vulgarised by the neighbourhood of an iron-foundry. It used to be called Panmure House, having been originally the town mansion of the Earl of Panmure, who was forfeited for his concern in the rebellion of 1715.

It is interesting to know respecting Adam Smith, that he was an artless, unworldly man, of perfect purity of life, and extraordinary benevolence. As a consequence of his so exclusive devotion to study, he was remarkable for absence of mind, and for a habit of speaking to himself. It is a veritable anecdote told of him in Edinburgh, that a fishwoman was impressed by his uncouth manner and his loud mutterings as he passed along the street, with the idea that he was a lunatic, remarking pathetically to a companion, 'And he's weel put on too;' that is, well-dressed—her sense of the calamity being greatly increased by its contrast with his obvious good circumstances. He lived very inexpensively—being, as he himself remarked, 'a beau only in his books.' It therefore gave surprise that at his death he did not leave much money. The explanation at length appeared, in various cases which came to light, making it certain that he had been in the practice of giving large sums in charity, though with such modesty that the fact was not suspected in his lifetime.

So kind, gentle, self-devoting, and inoffensive was the philosopher to whom was vouchsafed the first clear insight into the principles which rule the great material interests of man in society.

MOHALLET ABOU ALI; OR THE INHOSPITABLE VILLAGE.

THERE are two different modes of ascending the Nile, according as travellers are in a hurry, or leisurely disposed. In the first case, you must be in a perpetual conflict with the captain of your boat and the crew; you must coax or bully, promise or threaten; you must be up with the first streak of day, and see that there is a due supply of loaves on board, that one of the men has not gone ashore on the understanding that he is to be waited for on the next reach, and that none of the tackle wants mending; you must take care that a sufficient number of hands go to the tracking-rope; you must be deaf to the thousand reasons urged for stopping at every village, where some one is sure to have a friend or a relation; and you must storm and rave if the boat runs a-ground until it is got off again. At least this is the system adopted, whether from necessity or not. I have made such a trip once, and never wish to do so again, for the celerity gained is but comparative. Unless a good wind serves, your progress must, after all, be slow, and there is a great deal of bustle and annoyance without any corresponding advantage.

I always preferred the other way of going to work, especially in my excursions along the shores of the Delta. The object was not so much to leave so many villages and so many palm-woods in the rear, as to escape from absolute repose. A few hours' sail suffice to reveal all the variety of which the landscape is susceptible. There are no new prospects to expect, no new points of view to attain. The same kind of country spreads on all sides in its vast monotonous tranquillity. Plain and wood, wood and plain, succeed and resemble one another; the village you reach is the counterpart of the one you have quitted; and the same white tomb seems constantly gleaming from the same copse. Even the river, with its islands, its creeks, its tortuous branches, its lake-like expanses, its sombre eddies and shining shallows, appears to take a delight in repeating itself. The eye is perpetually recognising characteristics it had before observed. The long rows of birds that are seen each morning on the edge of some vast sandbank, make their appearance again in the evening, as if the current had refused to permit an ascension, and kept the boat all day in the same place. The sky has an aspect equally unchanging with the earth: the sun glares down from dawn to eve in unsullied brightness; it rises from the horizon unattended by clouds, and sinks, when its course is run, in a vapourless west.

Yet it must not be supposed that this want of striking variety introduces any sense of weariness into the mind. There is something in the climate of Egypt that disposes one not to seek for violent contrasts, but to allow with pleasure the approach of such ideas only as impress themselves by almost imperceptible degrees. I was always happy on the Nile, always content with myself and with the world. In the absence of the excitement created in other countries by the perpetual alternation of hill and valley, of rocky or wood-lined vias opening and shutting in on either hand, of ruin-crowned rocks or shadowy hollows, of torrents dancing in the sunshine, or lakelets sleeping beneath the umbrage of outstretched branches—I found pleasure in watching the little accidents that diversified, to an attentive eye, the scene that at first appeared so monotonous. Seated on the roof of the cabin, I endeavoured to become acquainted with the outline of every palm-grove, the peculiar beauties of every minaret, the dimensions of every tomb, the direction of every canal. I traced the progress of little caravans as they wound

along the embankments; I marked the varieties of the aspect, or the progress of the river in eating away its banks, or devouring little islands, or creating others. There was always something to see and notice: here a drove of buffaloes immersing their huge bulk in the water; there a number of camels and asses with their owners waiting for a ferry-boat; now a flight of pigeons; then a legion of aquatic birds. The variety in the craft afloat is great, from the vast unwieldy *dahabieh*, with its house-like cabin, and lofty prow, and sails more than a hundred feet in length, to the little canoe impelled by a square yard of canvas.

We had left Fouah early in the morning, and by taking advantage sometimes of a light breeze that came sighing across the waters, sometimes of the tracking-rope, had made about a dozen miles, when the *reis* (captain) with a complacent air announced that, satisfied with the day's work, he meant to stand over to a village that was in view on the western bank, and lie to for the night. As we had no particular object in hurrying on, we might have submitted quietly to this lazy plan, had he not, with true Arab loquacity, proceeded to give fifty reasons for a delay. At the third or fourth we stopped him, and announced our determination to proceed. He had unconsciously furnished us with an object, excited our imaginations, whetted our curiosity. Unfortunate man! he did not know that it is the weakness of the European in his travels to seek rather than to avoid danger: so he told us that if we passed on, the breeze that was beginning to crisp the surface of the river would bear us about night to Mohallet Abou Ali, a village celebrated for inhospitality, where strangers were always insulted, ill-treated, sometimes robbed and murdered.

'This is delightful!' said my companion. 'I am not quite so Oriental as you, and confess that this indolent *keyf* was beginning to be wearisome. A village of robbers will be an agreeable episode.'

'I agree with you,' replied I, 'for you exaggerate my Orientalism. It is true I feel an ineffable sense of well-being in this dreamy kind of life—that the rocking of the boat and the splashing of the waters, and the lazy contemplation of this beautiful country as it steals by, produce sensations sufficiently keen to occupy my mind; but I am not yet insensible to the spur of novelty, and our *reis* has succeeded in rousing me. Ho! then, for Mohallet Abou Ali!'

And the boat, which had already begun to incline towards the village on the opposite bank, resumed its former direction; the breeze filled our vast sail; we turned a long, low point; the breeze increased; the waves began to rise; the breeze became a gale; and on we went, until, a little after sunset, we reached a long, low shore, where two or three boats made fast announced the neighbourhood of a village.

The short twilight of the East was already nearly over. All was dim and uncertain; the river passed like a vast phantom, the skirts just rustling against the shadowy banks; at some distance inland we could distinguish a pile of buildings, dark and sombre, which we judged to be the village, rising at the extremity of the vast flat, alongside which we were moored. The boats near us were deserted; save one, in the cabin of which we could discern a figure going through the evolutions of prayer. All was silent. Our crew seemed oppressed with fear, and spoke in an undertone. None of them seemed inclined to land; but they all sat before the mast in a circle, deploring no doubt the rashness which had brought them into so dangerous a position. Suddenly we heard in the distance a noise, as if some huge marine monster was beating the river with its paws. It came nearer and nearer, and presently rounding a point, a huge flaming eye came in sight! It was a steamer from Cairo; and she soon vanished in the gloom.

The tea passed in silence, but the prospect of a visit to the inhospitable village still retained its seduction; and duly armed with our pipes, we were soon traversing

the flat, followed by the trembling Ahmed. After a couple of hundred yards, we found our feet sinking in the mud, and by stooping down, discerned a broad expanse of water before us. We beat a retreat, and again and again tried our luck, but each time were stopped by the same obstacle. We said it was disagreeable, but Ahmed declared that it was fortunate: that it was better to return and sleep in the boat, and that we could explore the village in the morning. Necessity was about to force us to adopt this plan, when we discerned half-a-dozen men approaching us armed with spears or staves, we could not tell which. They asked us gruffly what we were doing there; but on our saying that we wished to go to the coffee-house, offered to point out the road.

'Do not go,' whispered Ahmed; 'you see they have come out armed to attack us.'

We had no faith, however, in robbers, and followed our guides, who took us to a kind of ford, and introduced us safely into the sombre streets of the village. This done, they returned towards the river, leaving us in some uncertainty whether or not they were actuated by evil intentions. Ahmed strongly advised us to return and defend our property; but we urged that there would probably be as much difficulty as before in finding the ford. So we continued to grope along through the darkness, much astonished at perceiving no lights, and not the trace of a human being. At length, however, we heard a murmur of voices down a narrow lane; and led by this, reached a low door, through the interstices of which a dim light gleamed. We knocked, and were admitted into a spacious coffee-house crammed with people, who, as they expressed no surprise at seeing us, probably expected our arrival. It was at once evident that there was something peculiar in the character of the inhabitants of Mohallet Abou Ali. Nobody returned our greetings with cordiality; some affected not to hear them; a few responded merely by an uncivil stare. It was with difficulty we procured a seat; and when we did so, it was very far from the seat of honour, usually conceded in all Egyptian villages to a stranger, of no matter what creed.

This reception was far from being of good augury, but we had come with a determination to be agreeable to ourselves and others. We offered pipes and tobacco, which, though reluctantly accepted by some, constrained evidently the good-will of others. This supplied us with an idea, and we diplomatically resolved at all events to create a party in our favour. By degrees the host, who had received us with contemptuous indifference, began to relax as he counted the cups of coffee we ordered; and Ahmed, who had at first sat on the ground moody and uneasy, bestowed approving glances upon us, and collecting his Italian, said, 'Buono, buono, signori!' The evil-disposed, meanwhile, who had evidently endeavoured to prepare us a disagreeable reception, finding that they were reduced to a minority, sat in gloomy groups on one side, principally collecting round an Arnaout soldier, who twisted his moustache most ferociously.

Presently a young man began to sing the song 'Doos, y a lellee!' once so popular in Egypt, but now replaced in the great towns by more modern productions. Upon this Ahmed, who piqued himself on being a connoisseur, could not restrain a show of contempt, and continuing his reflection in Italian, said, 'Ma è buono perquesti porchi!' ('But it is good enough for these hogs!')

'Hogs! Who are hogs?' inquired the Arnaout, who understood the single word, looking inexpressibly vicious at Ahmed.

Ahmed offered an explanation, and the song proceeded. It was terribly long; the singer did not spare us a single quaver or a single repetition; and his hearers applauded enthusiastically at every line. The scene was a curious one to behold. A large room, with doors and windows closed, was but half-lighted by a small oil-lamp that swung by a cord from the ceiling. In one corner was a little square place, partly divided

off, that served as kitchen and office, where all the utensils connected with the establishment are kept—as pipes, shishkes, coffee-pots, zerfs, frizans, &c. including a large jar of water. The glare of a charcoal fire illuminated the face of a one-eyed, half-naked waiter, who superintended the cooking operations; whilst the master bustled about, serving and receiving payment. The company was disposed around on divans, or in the centre of the apartment on little seats of palm-wood. It was easy to distinguish the notabilities of the place. The Sheik-el-Beled, who should have performed the duties of hospitality towards us, sat apart in voluntary obscurity. He was hesitating between the prejudices of his people and fear of the displeasure of a Frank. Near him were two or three Fellahs of the better class, in turbans and clean blue shirts, probably small proprietors; there were also a few shopkeepers—the dealer in tobacco, who discoursed learnedly on *troubak*; the clothier, who made a voyage to Cairo or Alexandria four times a year to renew his stock; the barber, who was easy to be recognised by his loquacity; and the indigo dyer, who was still blue from top to toe. The remainder were for the most part ordinary labourers, with the exception of the *Arnaout*, and a few captains of boats or common sailors. This collection of *tarbooshes* (turbans), *libdehs* (felt caps), and *takiahs* (white skull-caps)—of faces bearded or unbearded, sallow or brown, scowling or jovial—of jackets, shawls, blue shirts, or blue trousers, and naked legs—of pipes of all dimensions—of wreaths or clouds of smoke—would have formed, beneath the dim gleam of the centre light, an admirable subject for a painter, especially as the singer, who had taken up his position near the door, formed a point of attraction for all eyes.

I really forget how the harmony of the scene was disturbed. It could not have been the tea; it could not have been the excitement of the adventure with the steamer; it may have been indignation at the scowling glances now and then directed by some bigoted group towards us; it may have been fatigue at the length of the song; it may have been something else—mere exuberance of health, for example—but I think I remember, whilst the inhospitables were venting their admiration somewhat impiously at a passage more licentious than usual by a sonorous 'Ullah!' that a joke was uttered by one of us that tickled our fancies so extremely, that a peal of inextinguishable laughter, rising by degrees into a perfect crow of delight, burst forth. All was immediately confusion. Black beards shook, white teeth gleamed, round eyes flashed, everybody rose, and it will easily be imagined that we rose also. The time for retreat was come, but we found the door by which we had entered blocked up by a crowd of the most infuriated. We paid what we owed; and amidst a perfect Babel of voices, made our exit in another direction, leaving the anger of the Arabs to evaporate, as it usually does, in exclamations and oaths. We found ourselves in a kind of bazaar, perfectly deserted, and had some difficulty in making our way out. Succeeding at length, we returned towards the boat, but soon perceived that we were pursued by a number of men armed with long sticks. Their courage had got up as soon as we disappeared, and the most fanatic had no doubt made dreadful vows of punishment against the irreverential infidels. 'We shall all be killed!' said Ahmed. 'Let us run to the boat, and get the guns!' We judged it better to wait for the pursuers, who, perceiving that we turned back tranquilly towards them, came to a halt. One or two approached, and I asked them if they had any fowls to sell. The question was received as a good joke, and raised a laugh, under cover of which we crossed the ford, and walked across the flat in the direction of the tall masts which we could dimly see in a line along the shore. The valiant 'Mohallet-Abou-Allians,' as we described them, remained talking furiously together for some time; but they did not approach, and at length returned no doubt to their coffee-house to anathematise us.

The instructive part of this adventure did not escape me. I reflected that it was both imprudent and improper to shock the prejudices and show any contempt for the customs of the people in whose country one travels; and profiting by my experience, I never afterwards, in any village, whether reputed inhospitable or not, met with the same reception as at Mohallet Abou Ali.

LONDON NEWSPAPERS AND LONDON THEATRES.

THE relation in which the journals and theatres of London stand towards each other involves many curious particulars, which are liable to be very imperfectly understood by all but the initiated. We propose endeavouring to give an impartial and dispassionate view of it.

It is not an imperative law, but it is something like an imperative custom, for every theatre in the metropolis to give a free admission for two to every metropolitan journal. It sometimes happens that a newspaper, choosing to indulge in a series of bitter diatribes against a particular theatre, has its orders stopped; but instances are rare, and such feuds are in general soon patched up. The rule adopted by the manager of the two most flourishing theatres in London is to accord a double free admission to any literary or political journal of a year's standing. Some such restriction as this is absolutely necessary to prevent a theatre from being deluged by the nominees of the scores of trumpery, catchpenny journals which spring daily up in mushroom swarms only to wither and die after a few weeks of struggling existence. We believe, indeed, that previous to the rule of a year's existence being more or less acted upon, not a few quasi-theatrical journals were started for the express purpose of getting orders—the produce of the sale of these admissions forming the chief revenue of the paper; at the present time, however, the vast majority of newspapers writing orders are established and respectable prints.

At first sight, the number of persons thus nightly admitted free may appear to be a very serious pull upon the treasury of the theatre. A little inquiry into the practical working of the system, however, will prove that—allowing for exceptional instances—the grievance is more theoretical than practical. As the vast majority of the 'order' audience is composed of persons who would not go to the theatre unless they had orders, it follows that they do positive pecuniary harm to the management only when they take up room which others would be willing to pay for. But the cases are exceedingly rare in which this, to any great extent at least, takes place. No manager counts, upon the average of nights, on completely filling his house with a paying audience; on the contrary, we believe that most managers would be very happy could they compound for two-thirds of the boxes being fairly and legitimately occupied upon an average of nights: it follows that the remaining third of the space may not only without loss, but with positive advantage to the theatre, so far as keeping up appearances goes, be occupied by persons who enter free of charge. The proof that such is the case is to be found in the fact, that not only is there in most theatres a tolerably long free-list—that is to say, a list of ladies and gentlemen having on different grounds complimentary admissions totally distinct from the press orders—but that there is frequently a pretty copious issue of manager's orders, generally distributed a short time before the performances begin, and only available if presented before seven o'clock, so as to compel their bearers to aid in what is always an essential matter in keeping up theatrical appearances—the formation of an apparently good house at the raising of the curtain. The *habitué* of the London theatres will tell at a glance the probable proportion of paying and non-paying audience—when a 'house is money'—when it is made up of 'paper'—or when, in still more pro-

often these criticisms—so neat, so pungent, so full of tact and taste—have been dashed off, as fast as pen can go over paper, often amid the buzz of a crowded supper-room, and despatched to the printing-office, perhaps an hour, perhaps half an hour after the fall of the curtain.

A. B. R.

ORIGIN OF THE CHOUAN INSURRECTION.

FROM THE FRENCH.

THE proclamation of the republic during the progress of the first French Revolution, as is pretty well known, led to the civil war in the western provinces of France, when the untutored peasantry of Maine and La Vendée with marvellous though mistaken heroism took up arms for the royalist cause; keeping the republic, as was said, in a state of fever, and exciting a contest compared with which, to use the words of the brave General Hoche, upon whom devolved the task of suppressing it, all others were but play. The long-continued action of oppressive laws had done much towards screwing people's minds up to the resisting point; and of all causes of irritation none was more grievous than the *gabelle* or salt-tax. In Maine the price of salt was thirteen sous the pound; and while the gentry obtained an annual supply of the indispensable commodity free of duty, the poorer portion of the population were compelled to buy it from the government stores, where they were cheated both in quality and measure. Even if disposed to forego the use of salt altogether, they were interdicted availing themselves of this resource: the law fixed a minimum quantity which each inhabitant was forced to pay for. Recusancy was punished by fines, and smuggling by bullets; yet a large contraband trade in salt was actively carried on by a class of men called *faux-saulniers*. Nearly every peasant on the frontier of the province pursued the dangerous occupation: with a double sack on his shoulders, and armed with his long pole, which enabled him to leap hedges and ditches, he eluded the vigilance of the *gabelleurs*, or fought them if necessary: braving all dangers with a courage worthy of a better cause.

I had taken up my abode for a time in this part of the country, with a view to observe the present condition of its inhabitants, who retain many points of their ancient character. Among others, I had become acquainted with an honest miller, whose mill stood on a tributary of the Mayenne, and had heard him speak of one of his compatriots, the last representative of the adventurous guerillas of former times. I longed to see the old hero, who lived in a neighbouring village, and gather from him any particulars respecting his once-dreaded companions. The miller consented to drive me over in his car; 'But,' said he, as we rode along, 'it will be difficult to get him to speak, for he is always afraid of a reckoning. He is nothing more now than an old innocent, passing his days in knitting garters and hearing children say their catechism. But he has stopped diligences in his day, shot patriots, and decorated dogs'-tails with the tricoloured cockade. If you really wish him to relate his history, provide yourself with a bottle of cognac. You know that we must carry milk when we want to entice snakes from their holes.'

However this might be, it was evident that the miller on his part knew something of the matter in question. Shortly afterwards we came to a tree with a small cross nailed to the bark, before which a young girl was kneeling in apparent devotion.

'Ah, you are looking at the tall elm,' observed the miller as he checked the horse: 'in the time of the war that hollow trunk was the best hiding-place of the Chouans. A few years ago the skeleton of one of them was found inside there, with his musket and beads; the priests came and buried him, and nailed that fourpenny cross to the tree, and since then the people hereabouts take off their hats to it, or do still better, like that *tête blanche* there at her devotions. But, *pardi*, 'tis Jeannette; a descendant of the Brothers Chouan!'

'What!' I replied; 'is she one of the Cottereau family?'

'Just so. You would like to see her; eh? Hark ye, Jeannette, you have had enough of paternosters for once: it is not polite to show only your heels to the passers-by.'

The young girl made no movement. I expressed a doubt as to her having heard.

'Bah!' rejoined the miller, 'she has a quicker ear than a mole; but she won't disturb herself without a reason. I say, Jeannette, I have told the gentleman that you are the prettiest maiden in the parish; let him see that I have spoken truth.' Still no answer. 'Don't keep me waiting,' continued my companion; 'I have ten crowns' balance of account to pay over to you.'

The white headdress moved almost imperceptibly, but was not turned towards us. The miller laughed aloud—'I give up,' he said, again putting the horse in motion, 'since the ten crowns won't move her. You see that the young rogue can be deaf, and dumb too, when she likes. She is a true daughter-in-law of the Widow Poiriers.'

'And who was she?' I asked.

'The mother of the Brothers Chouan,' answered the miller; 'her freehold was called Les Poiriers; and among us each one takes the name of the land he cultivates. I can tell you her history, if you have never heard it.'

I immediately assumed an attitude of attention.

'You must know, first of all,' continued my companion, 'that the Cottereau family were sabot-makers from father to son, and lived in the middle of the woods in cabins built of leaves and chips. There their children were born, and brought up like wolves, with no other nurse than their own good pleasure. When of the proper age, they took their poles, and became *faux-saulniers*, after the example of their fathers. It appears that such a mode of life made them in time so gloomy and savage, that the people of the country gave them the name of Chouins,* which since then has stuck to the family. The father of the three Cottereaus was, however, more sociable. By his sole aid he had obtained some education, and came every Sunday to Les Poiriers to read the lives of the saints to the men, and teach the holy service to the young girls. It was in this way that he made the acquaintance of Jeanne Moyné, and that they fell in love with each other: but the farmer could not give his daughter without disgrace to a man who had never cultivated the earth: so the lover was dismissed, and Jeanne received orders to bestow her heart elsewhere. She made no reply to the command: she neither prayed nor wept; only a few days afterwards she fled from the farm, and to let it be understood that she should not return, left her distaff and porringer broken at the door of the stable! Cottereau, who was waiting for her upon the road to Laval, conducted her to his cabin in the forest of Coucise. But Jeanne gave him to understand that she would not reside with him until they had been married by a priest. On the Sunday, therefore, they started for Saint-Ouën-des-Toits. The young girl went alone into the church to speak to the rector, but, as it happened, he had just mounted the pulpit to deliver the monitory. After having reprimanded those of his parishioners by name who had neglected the offices of the church, or worked on holy days without a dispensation, he announced that a girl of the neighbourhood had just caused much scandal by quitting her home to follow her lover; and he called upon her, according to custom, to confess her fault before the assembled parishes, under pain of excommunication. Thereupon Jeanne, who was kneeling in front of the pulpit among the other *têtes blanches*, and who had kept her head bent down to avoid recognition, suddenly stood up with a tranquil countenance, and began to recite her *confiteor* with audible voice. As you may suppose, this was a great

* The patois of the district for *chats-huans*, screech-owls; and *chouin*, by corruption, became *chouan*.

astonishment for those who were present: the rector himself hardly knew whether to approve or to blame. He questioned the maiden concerning her flight; but, as I have heard my uncle say, who was one of the company, she gave such good reasons that all the women began to shed tears, and even the fathers of families could find nothing to say against them. As for the priest, he finished by recommending her to the prayers of the congregation; and the next evening he made her return, and married her privately to Cottereau, and afterwards gave them a certificate, to prevent their being disturbed in other parishes.

Here I interrupted the narrative, to inquire whether Jeanne had not reason soon to repent her marriage with the sabot-maker.

"Not that I know of," replied the miller. "Cottereau was a severe man, but without *badness*, as they say here. He, however, died early; and then the widow came to live at Les Poiriers, which had been left to her, with her two daughters and four sons, among whom was the famous Jean Chouan.

"Before declaring war against the Blues," pursued my companion, whom I was glad to find in a talking vein, "Jean had become the most celebrated faux-saulnier of the province of Maine. He was always full of schemes to cheat the gabelleurs, and led the *contrebandiers* into many a scrape with his usual phrase, "there's no danger!" But in spite of his cleverness, he did not always escape without penalty or prison, only he revenged himself by new tricks. One day the officers from Laval, who had often imposed fines upon him which he would not pay, came over to seize the effects on the farm; but the Cottereaus, warned in time, carried away their property to neighbours' houses, and the officers found nothing but the four walls. However, they were not at a loss: the house had just been newly roofed, and they called in workmen to take off the slates and rafters, in order to sell them to the highest bidder. Jean would not quarrel with those who kept within their duty; instead of complaining, he himself aided in the work of unroofing, and in the evening invited the officers to see whether it had been done to their liking. His majesty's servants, who glorified themselves on a triumph, came without mistrust; but scarcely had they entered than Jean double-locked the door upon them, declaring, that since they prepared roofless houses for others, it was but fair they should make a trial of them; and as rain began to fall, he wished them good-night, and rejoined his companions in the village.

"That trick, I have heard my uncle say, cost him more than two hundred crowns; and before long he and his two brothers, the faux-saulniers, were tracked like foxes. The Poiriers family was ruined by judgments and seizures: they were in debt to everybody—farmer, miller, and baker: Jean grew yellow with spite and vexation at not being able to run a bag of salt without being taken. At length he started with a party of awkward fellows, all determined to open their way with their poles. They met the gabelleurs; there was a fight, and Jean killed the boldest of the opponents, Little Pierre, surnamed the *Fin Gabelou*. All the faux-saulniers present at the murder were in consternation, and clamoured for Jean to betake himself to Brittany, where he might hide for a time. "There's no danger!" he answered; and the same night he was in jail at Laval! His condemnation was certain, for offences against the salt-laws were judged by the very administrators of those laws, who were sure to pronounce in their own favour. The news of the event was brought to Jean's mother as she sat milking the last goat which confiscations had left at Les Poiriers. She sprang up in terror, exclaiming, "Heavens! the vagabond will be hanged." But taking courage again directly, she put on her best pair of shoes, as the old ballad says, and hastened to the chateau of the Princes of Talmont, who had always protected her family. As ill-luck would have it, they had just set out for the court. The widow sat for an hour on the staircase of

the mansion like one condemned waiting for the final stroke. At last she started up, saying, "There's only the king can pardon Jean;" and, as the song again mentions, carrying her shoes in her hand, she set out for Versailles.

"And did she arrive there?" I exclaimed involuntarily.

"On the fifth day," rejoined the miller, "she had travelled seventy leagues upon the *hide of her feet*, without stopping except to beg for a morsel of bread when she was hungry, and a bed of straw in the barn when sleepy. But on reaching Versailles she learned that the Talmonts, through whom alone she could be admitted to the king, had delayed at some chateau on the route, no one knew where, and perhaps would be a long time before they came. This time poor Jeanne lost all heart. She passed a whole night on her knees before a crucifix without ceasing to weep; she knew no one at Versailles except the Prince of Talmont's coachman, a rustic from Saint-Ouën-des-Toits, who was quite overcome by the sight of so many tears, and asked her whether she had the courage to speak to the king all alone. "To save Jean," she answered, "I would speak to the pope!" "Well, then," replied Jerome, "I'll risk my place and all to serve a compatriot. You shall get into the prince's coach; the guards will think it is he going to pay his duty, and will let us pass the gates without a word; and when the king comes out of the grand vestibule to step into his coach, you must go and throw yourself at his feet; and pray Heaven to put words into your mouth, for it is the fate of all of us that will be decided!" The project was executed that very day: Jeanne took her seat in the coach, waited for the king, and as soon as he appeared ran towards him, crying, "Pardon, monseigneur; the Gabelleurs have ruined us, and now they want to hang my son because he made himself a faux-saulnier. Save Jean, monseigneur: there will be seven of us to pray to God for you!"

"At first the king was bewildered to hear himself called monseigneur by a woman with a wild look and in unknown costume. The people of the court exclaimed that she was mad, and ought to be arrested; but when she had related everything, it was who should admire the most. The king retired to sign a reprieve with his own hand, while waiting the pardon, which was sent off a few days afterwards.

"And it was this same faux-saulnier," I said, "saved from the gibbet by the king, who tried in after-times to avenge him by commencing the royalist insurrection in the west?"

"The same. Jean Chouan was the first in France to take up his musket against the republic at the cry of *Vive le Roi*. But here we are at the end of our journey."

We had in fact just turned into an avenue of plum-trees, leading to the farm of Boutières, and were just in time to assist at the annual harvest festival. I felt double pleasure in a ride during which I had learned so much respecting the origin of what will long be remembered as *La Chouannerie*.

OCCASIONAL NOTES.

LOW-PRICED PIANOFORTES.

WE are very glad to learn that the spirited conduct of Messrs Collard and Collard in lowering the price of a certain class of pianofortes has been attended with distinguished success, in as far as a very considerable sale has been obtained for these instruments. The merit of the firm deserves to be the more handsomely acknowledged—to use a phrase of Johnson's—since it is one of a very small number of British pianoforte makers who may be said to constitute the first class. It is so seldom that a first-class house is disposed to take a lead in innovations for the benefit of the public, and its doing so is so sure to expose it to odium among its *confrères*, that our recurring to the subject on the present occasion seems but the simplest justice.

often these criticisms—so neat, so pungent, so full of tact and taste—have been dashed off, as fast as pen can go, over paper, often amid the buzz of a crowded supper-room, and despatched to the printing-office, perhaps an hour, perhaps half an hour after the fall of the curtain.

A. B. R.

ORIGIN OF THE CHOUAN INSURRECTION.

FROM THE FRENCH.

THE proclamation of the republic during the progress of the first French Revolution, as is pretty well known, led to the civil war in the western provinces of France, when the untutored peasantry of Maine and La Vendée with marvellous though mistaken heroism took up arms for the royalist cause; keeping the republic, as was said, in a state of fever, and exciting a contest compared with which, to use the words of the brave General Hoche, upon whom devolved the task of suppressing it, all others were but play. The long-continued action of oppressive laws had done much towards screwing people's minds up to the resisting point; and of all causes of irritation none was more grievous than the *gabelle* or salt-tax. In Maine the price of salt was thirteen sous the pound; and while the gentry obtained an annual supply of the indispensable commodity free of duty, the poorer portion of the population were compelled to buy it from the government stores, where they were cheated both in quality and measure. Even if disposed to forego the use of salt altogether, they were interdicted availing themselves of this resource: the law fixed a minimum quantity which each inhabitant was forced to pay for. Recusancy was punished by fines, and smuggling by bullets; yet a large contraband trade in salt was actively carried on by a class of men called *faux-saulniers*. Nearly every peasant on the frontier of the province pursued the dangerous occupation: with a double sack on his shoulders, and armed with his long pole, which enabled him to leap hedges and ditches, he eluded the vigilance of the *gabelleurs*, or fought them if necessary: braving all dangers with a courage worthy of a better cause.

I had taken up my abode for a time in this part of the country, with a view to observe the present condition of its inhabitants, who retain many points of their ancient character. Among others, I had become acquainted with an honest miller, whose mill stood on a tributary of the Mayenne, and had heard him speak of one of his compatriots, the last representative of the adventurous guerillas of former times. I longed to see the old hero, who lived in a neighbouring village, and gather from him any particulars respecting his once-dreaded companions. The miller consented to drive me over in his car: 'But,' said he, as we rode along, 'it will be difficult to get him to speak, for he is always afraid of a reckoning. He is nothing more now than an old innocent, passing his days in knitting garters and hearing children say their catechism. But he has stopped diligences in his day, shot patriots, and decorated dogs'-tails with the tricoloured cockade. If you really wish him to relate his history, provide yourself with a bottle of cognac. You know that we must carry milk when we want to entice snakes from their holes.'

However this might be, it was evident that the miller on his part knew something of the matter in question. Shortly afterwards we came to a tree with a small cross nailed to the bark, before which a young girl was kneeling in apparent devotion.

'Ah, you are looking at the tall elm,' observed the miller as he checked the horse: 'in the time of the war that hollow trunk was the best hiding-place of the Chouans. A few years ago the skeleton of one of them was found inside there, with his musket and beads; the priests came and buried him, and nailed that fourpenny cross to the tree, and since then the people hereabouts take off their hats to it, or do still better, like that *tête blanche* there at her devotions. But, *pardi*, 'tis Jeannette; a descendant of the Brothers Chouan!'

'What!' I replied; 'is she one of the Cottereau family?'

'Just so. You would like to see her; eh? Hark ye, Jeannette, you have had enough of paternosters for once: it is not polite to show only your heels to the passers-by.'

The young girl made no movement. I expressed a doubt as to her having heard.

'Bah!' rejoined the miller, 'she has a quicker ear than a mole; but she won't disturb herself without a reason. I say, Jeannette, I have told the gentleman that you are the prettiest maiden in the parish; let him see that I have spoken truth.' Still no answer. 'Don't keep me waiting,' continued my companion; 'I have ten crowns' balance of account to pay over to you.'

The white headdress moved almost imperceptibly, but was not turned towards us. The miller laughed aloud—'I give up,' he said, again putting the horse in motion, 'since the ten crowns won't move her. You see that the young rogue can be deaf, and dumb too, when she likes. She is a true daughter-in-law of the Widow Poiriers.'

'And who was she?' I asked.

'The mother of the Brothers Chouan,' answered the miller: 'her freehold was called Les Poiriers; and among us each one takes the name of the land he cultivates. I can tell you her history, if you have never heard it.'

I immediately assumed an attitude of attention.

'You must know, first of all,' continued my companion, 'that the Cottereau family were sabot-makers from father to son, and lived in the middle of the woods in cabins built of leaves and chips. There their children were born, and brought up like wolves, with no other nurse than their own good pleasure. When of the proper age, they took their poles, and became *faux-saulniers*, after the example of their fathers. It appears that such a mode of life made them in time so gloomy and savage, that the people of the country gave them the name of Chouins,* which since then has stuck to the family. The father of the three Cottereaus was, however, more sociable. By his sole aid he had obtained some education, and came every Sunday to Les Poiriers to read the lives of the saints to the men, and teach the holy service to the young girls. It was in this way that he made the acquaintance of Jeanne Moyné, and that they fell in love with each other: but the farmer could not give his daughter without disgrace to a man who had never cultivated the earth: so the lover was dismissed, and Jeanne received orders to bestow her heart elsewhere. She made no reply to the command: she neither prayed nor wept; only a few days afterwards she fled from the farm, and to let it be understood that she should not return, left her distaff and porringer broken at the door of the stable! Cottereau, who was waiting for her upon the road to Laval, conducted her to his cabin in the forest of Coucise. But Jeanne gave him to understand that she would not reside with him until they had been married by a priest. On the Sunday, therefore, they started for Saint-Ouën-des-Toits. The young girl went alone into the church to speak to the rector, but, as it happened, he had just mounted the pulpit to deliver the monitory. After having reprimanded those of his parishioners by name who had neglected the offices of the church, or worked on holy days without a dispensation, he announced that a girl of the neighbourhood had just caused much scandal by quitting her home to follow her lover; and he called upon her, according to custom, to confess her fault before the assembled parishes, under pain of excommunication. Thereupon Jeanne, who was kneeling in front of the pulpit among the other *têtes blanches*, and who had kept her head bent down to avoid recognition, suddenly stood up with a tranquil countenance, and began to recite her *confiteur* with audible voice. As you may suppose, this was a great

* The patois of the district for *chats-huans*, screech-owls; and *chouin*, by corruption, became *chouan*.

astonishment for those who were present: the rector himself hardly knew whether to approve or to blame. He questioned the maiden concerning her flight; but, as I have heard my uncle say, who was one of the company, she gave such good reasons that all the women began to shed tears, and even the fathers of families could find nothing to say against them. As for the priest, he finished by recommending her to the prayers of the congregation; and the next evening he made her return, and married her privately to Cottereau, and afterwards gave them a certificate, to prevent their being disturbed in other parishes.

Here I interrupted the narrative, to inquire whether Jeanne had not reason soon to repent her marriage with the sabot-maker.

'Not that I know of,' replied the miller. 'Cottereau was a severe man, but without *badness*, as they say here. He, however, died early; and then the widow came to live at Les Poiriers, which had been left to her, with her two daughters and four sons, among whom was the famous Jean Chouan.

'Before declaring war against the Blues,' pursued my companion, whom I was glad to find in a talking vein, 'Jean had become the most celebrated faux-saulnier of the province of Maine. He was always full of schemes to cheat the gabelleurs, and led the *contrebandiers* into many a scrape with his usual phrase, "there's no danger!" But in spite of his cleverness, he did not always escape without penalty or prison, only he revenged himself by new tricks. One day the officers from Laval, who had often imposed fines upon him which he would not pay, came over to seize the effects on the farm; but the Cottereaus, warned in time, carried away their property to neighbours' houses, and the officers found nothing but the four walls. However, they were not at a loss: the house had just been newly roofed, and they called in workmen to take off the slates and rafters, in order to sell them to the highest bidder. Jean would not quarrel with those who kept within their duty; instead of complaining, he himself aided in the work of unroofing, and in the evening invited the officers to see whether it had been done to their liking. His majesty's servants, who glorified themselves on a triumph, came without mistrust; but scarcely had they entered than Jean double-locked the door upon them, declaring, that since they prepared roofless houses for others, it was but fair they should make a trial of them; and as rain began to fall, he wished them good-night, and rejoined his companions in the village.

'That trick, I have heard my uncle say, cost him more than two hundred crowns; and before long he and his two brothers, the faux-saulniers, were tracked like foxes. The Poiriers family was ruined by judgments and seizures: they were in debt to everybody—farmer, miller, and baker: Jean grew yellow with spite and vexation at not being able to run a bag of salt without being taken. At length he started with a party of awkward fellows, all determined to open their way with their poles. They met the gabelleurs; there was a fight, and Jean killed the boldest of the opponents, Little Pierre, surnamed the *Fin Gabelou*. All the faux-saulniers present at the murder were in consternation, and clamoured for Jean to betake himself to Brittany, where he might hide for a time. "There's no danger!" he answered; and the same night he was in jail at Laval! His condemnation was certain, for offences against the salt-laws were judged by the very administrators of those laws, who were sure to pronounce in their own favour. The news of the event was brought to Jean's mother as she sat milking the last goat which confiscations had left at Les Poiriers. She sprang up in terror, exclaiming, "Heavens! the vagabond will be hanged." But taking courage again directly, she put on her best pair of shoes, as the old ballad says, and hastened to the château of the Princes of Talmont, who had always protected her family. As ill-luck would have it, they had just set out for the court. The widow sat for an hour on the staircase of

the mansion like one condemned waiting for the final stroke. At last she started up, saying, "There's only the king can pardon Jean;" and, as the song again mentions, carrying her shoes in her hand, she set out for Versailles.'

'And did she arrive there?' I exclaimed involuntarily.

'On the fifth day,' rejoined the miller, 'she had travelled seventy leagues upon the *hide of her feet*, without stopping except to beg for a morsel of bread when she was hungry, and a bed of straw in the barn when sleepy. But on reaching Versailles she learned that the Talmonts, through whom alone she could be admitted to the king, had delayed at some château on the route, no one knew where, and perhaps would be a long time before they came. This time poor Jeanne lost all heart. She passed a whole night on her knees before a crucifix without ceasing to weep; she knew no one at Versailles except the Prince of Talmont's coachman, a rustic from Saint-Ouën-des-Toits, who was quite overcome by the sight of so many tears, and asked her whether she had the courage to speak to the king all alone. "To save Jean," she answered, "I would speak to the pope!" "Well, then," replied Jerome, "I'll risk my place and all to serve a compatriot. You shall get into the prince's coach; the guards will think it is he going to pay his duty, and will let us pass the gates without a word; and when the king comes out of the grand vestibule to step into his coach, you must go and throw yourself at his feet; and pray Heaven to put words into your mouth, for it is the fate of all of us that will be decided!" The project was executed that very day: Jeanne took her seat in the coach, waited for the king, and as soon as he appeared ran towards him, crying, "Pardon, monseigneur; the Gabelous have ruined us, and now they want to hang my son because he made himself a faux-saulnier. Save Jean, monseigneur: there will be seven of us to pray to God for you!"

'At first the king was bewildered to hear himself called monseigneur by a woman with a wild look and in unknown costume. The people of the court exclaimed that she was mad, and ought to be arrested; but when she had related everything, it was who should admire the most. The king retired to sign a reprieve with his own hand, while waiting the pardon, which was sent off a few days afterwards.'

'And it was this same faux-saulnier,' I said, 'saved from the gibbet by the king, who tried in after-times to avenge him by commencing the royalist insurrection in the west?'

'The same. Jean Chouan was the first in France to take up his musket against the republic at the cry of *Vive le Roi*. But here we are at the end of our journey.'

We had in fact just turned into an avenue of plum-trees, leading to the farm of Boutières, and were just in time to assist at the annual harvest festival. I felt double pleasure in a ride during which I had learned so much respecting the origin of what will long be remembered as *La Chouannerie*.

OCCASIONAL NOTES.

LOW-PRICED PIANOFORTES.

WE are very glad to learn that the spirited conduct of Messrs Collard and Collard in lowering the price of a certain class of pianofortes has been attended with distinguished success, in as far as a very considerable sale has been obtained for these instruments. The merit of the firm deserves to be the more handsomely acknowledged—to use a phrase of Johnson's—since it is one of a very small number of British pianoforte makers who may be said to constitute the first class. It is so seldom that a first-class house is disposed to take a lead in innovations for the benefit of the public, and its doing so is so sure to expose it to odium among its *confrères*, that our recurring to the subject on the present occasion seems but the simplest justice.

It is right, however, to state at the same time, that the highly respectable house of D'Almaine and Co. have, from even a period before our first allusion to the subject, been making movements towards a popularisation of the pianoforte. An upright instrument of elegant structure in rosewood, with metallic plate, and a keyboard extending to $6\frac{1}{2}$ octaves, has for several years been made by them, at thirty guineas. Since the end of last year, the price of this instrument, for the excellence of which we have seen high testimonies, has been reduced to twenty-five guineas. We find that our friend Mr Purdie of Edinburgh makes similar instruments at the same price. D'Almaine and Co. have even succeeded in producing instruments in fine cases, which they will be able to offer at twenty guineas, or, if successful with a contemplated substitute for ivory, at twenty pounds, the latter being the price which we have ideally set up as that which would secure a great extension of the use of the instrument among the middle classes of the people.

In the choice of a pianoforte, so much must depend on the character of the maker for giving assurance of quality and durability, that the productions of makers as yet devoid of a name are generally felt to be unworthy of consideration. Nevertheless, having expressed a desire to see pianofortes brought down to twenty pounds, we feel bound to notice the first intimation which reached us of this being accomplished. Mr Thomas Fisher of Gower Street, Bedford Square, having informed us that he has made a $6\frac{1}{2}$ piccolo, with metallic plate, pine case French polished, and the usual furnishings, at twenty pounds, we requested a friend of adequate skill to examine it and report. The report is as follows:—'It is a very good school-room piano, suitable for rough usage. The tone is clear, full, and rather loud than otherwise—something like the old-fashioned upright pianos. It wants in softness and richness, and would be more fitted for hard practising than for drawing-room music, or as an accompaniment to the voice. The appearance of the instrument is quite plain, though not inelegant. Altogether it would be a most useful instrument where the modern refinements of tone were not required.'

PRECAUTIONS AGAINST DISASTERS AT SEA.

The loss of so many lives by the sinking of the *Orion* steamer has, as usual in such cases, forcibly turned the attention of the public to means of prevention and remedy.

We fear it is almost vain to think of regulations against such disasters. Were there a liability to a very frequent running of valuable vessels on rocky coasts in the most favourable circumstances for keeping a safe course, it might be possible to regulate with advantage: but such accidents being rare even under the present imperfect arrangements, it appears to be impossible to sustain a proper amount of vigilance and care in the case. It is from this cause that sailors never have the idea of danger or possible disaster before them. Each feels that he never yet has been drowned, and hence he argues how unlikely it is that the circumstances which produce drowning are to take place before to-morrow. Were he, on the contrary, to be drowned once a week for two months, one can imagine him taking precautions so as not to be drowned above once a month for the future. Unfortunately for him, he cannot be drowned above once, and that is so seldom that the idea has no effect upon him. So it is with other dangers. We have been told by a gentleman who once crossed the Atlantic in a first-class steamer, that, considering the carelessness he saw in the use of lights by the crew and servants, it was a perfect marvel to him that the ship was not burnt. Each sailor, we presume, reflects that he never yet has been in a ship that took fire at sea, and that therefore it is very unlikely he ever will. Against a contingency so exceedingly slender, human foresight does not work. A vessel takes fire now and then, and the effects are dreadful. But the

sufferers are beyond benefiting by experience, and, as for others, why they all along knew that such a thing does happen occasionally, and they now feel that it is as remotely possible in their particular case as ever.

In the case of the *Orion* one circumstance was highly characteristic. The boats were quite unready to be let down into the sea to save the passengers, and, accordingly, one of them being to be disengaged only by cutting the fastenings, it went down end foremost, and canted a multitude of people into the water. Did any one ever see the boats in a better state of preparation? Our recollections of them in general bring them before our mind's eye as filled with barrels or other packages, as if the officers and crew (and this we believe to be the general case) despised the precaution of taking boats for the saving of lives in case of shipwreck, and, submitting to the taking of them with reluctance, were determined to signify for them all possible contempt.

While it may be difficult, or almost impossible, from the nature of the case, to keep up a vitality in any regulations for the protection of life at sea, there is nothing to prevent passengers from taking a precaution which, in a large class of cases, may prove the means of saving their lives. A swimming-belt, effectual for sustaining a full-grown person in the water, can be had for nine or ten shillings, and it does not take up more space in a carpet-bag than a night-shirt. The utility of this simple article has been often pointed out, and it is to be seen in shop-windows in almost every large town; yet its serviceableness does not seem to have been generally apprehended; otherwise we should surely have heard of some one of the unfortunate passengers by the *Orion* having been fortunately possessed of such an article. On that disastrous occasion, the circumstances were precisely those in which a swimming-belt can be used advantageously, the whole necessity being a mere sustentation of the person in the water till help should arrive. Yet not one of the hundred and thirty passengers had taken this simple precaution. The result was that wild scene of helpless struggling in the water, from which it seems a wonder that any one besides the few able to swim should have escaped. The loss of the *Pegasus* in July 1846 was a precisely similar case. In a calm sea, on a summer night, close upon shore, every one of the passengers would have been almost sure of escaping to land if provided with this simple and inexpensive contrivance. After that sad affair, the newspapers were clamorous for air-cushions and life-buoys being carried in every steamer, as a provision against this class of accidents; but time passed on—and the suggestion was forgotten with the circumstances which had called it forth.

A STRANGER CHALLENGED.

What right, we should like to know, has the word 'party' to come in and usurp the place of the good old word 'person'? There is no such thing as a person or an individual now. The abstract idea of a human being is for the present to be described as 'a party.' We used to regard the word party long ago as usually a plurality—an assemblage. For example, a marriage-party, a dinner-party, a whist-party. Now the idea is concentrated into a single person. We hear of a party thrown from a curicle, and think of a number of people hurt in consequence; when, behold, the party is only one, and he escapes with a few bruises about the head. A house is for sale, and the agent tells us that several parties have been inquiring after it, as if people came in troops, when the fact is, they came but single spies at the most. A waiter at your hotel tells you there are several parties in the public-room: you go in expecting a crowd, when behold there are only three gentlemen, each sitting at a separate table, and the whole making a sufficiently meagre show. There is a provoking dubiety in all this, and the more provoking that it is unnecessary, seeing that there can be no sort of objection to the use of the proper word person.

The misuse of the word party took its rise a few

years ago in mercantile circles. It is often, of course, necessary in such quarters to speak of bargains or negotiations, in which cases there are always two parties concerned. Here the word is rightly used, whether there be one or more men on each side. It may be A and B against C, when of course A and B form the one party in the affair, and C, singly by himself, the other. Mercantile men, having so often occasion to speak of individuals in this way as parties, came at length to lose sight of the distinction between the two, and used the word party for individual on all occasions, whether right or wrong. This, however, should be resisted in literature, and even in conversation, as a vulgarism, and we proclaim war against it accordingly.

STATE OF AMERICAN AGRICULTURE.

At a late meeting of a farmer's club in Berwickshire, Professor Johnston gave an account of a tour which he had recently made in North America with a view to ascertain the state of agriculture in that quarter of the world. An abstract of his observations will be read with interest during the present contentions on rural matters:—

'The professor mentioned that the state of agriculture in the northern parts of America, in our own provinces, and in New England, was generally what the state of agriculture in Scotland probably was eighty or ninety years ago. In some parts of New Brunswick they are very nearly in the precise condition in which Scotland was 120 years ago. Go as far west as you like, and as far south as you like, the same general description applies to the whole. In regard to the cultivation of land in America, its condition arises from a variety of causes, and very few considerations will enable you to understand how it has come about. If you ask yourselves to what class does the majority of emigrants belong, you will have no difficulty in coming to a conclusion. Look at the great crowds of people who go from Ireland, from the Highlands of Scotland, and the hundreds of thousands proceeding from the great towns of England and Scotland—ask yourselves of what class they consist—what amount of intelligence and agricultural knowledge they possess; and in the answer to this you will at once find the key to the state of the land in the whole northern part of America. Now, what has been their procedure—by what kind of procedure have they brought about the state of exhaustion to which the soil has been reduced? Of course in speaking of the exhausted soil he did not refer to the virgin soil which had never received the plough or the spade, but to the soil under their cultivation, and which they were now exhausting. The forest was in the first place cut down and burned, after which the ashes were scattered, and a crop of wheat and oats was sown; when this crop was cut down another was sown; but they did not always remove the straw—they do not trouble themselves with any manure. The second year they sowed it again, and harrowed it, and generally took three crops in succession. When they can take no more out of it, they either sow grass seeds, or, as frequently, let it seed itself. They will then sometimes cut hay for twelve, fourteen, sixteen, eighteen, or twenty years in succession; in fact, so long as they can even get half-a-ton an acre from it. The land was then broken up, and a crop of oats taken—then potatoes—then a crop of wheat—and then hay for twelve years again; and so the same course was repeated. Now this was the way in which this land was treated; this was the way in which the exhaustion is brought about. This exhaustion existed in Nova Scotia, New Brunswick, Lower Canada, in Upper Canada to a considerable extent, over the whole of New England,

and extended even into the state of New York. Well, but what steps were they taking to remedy this state of things? Were they doing anything to bring back the land to a productive condition? and in order to do this, were they taking steps to put any knowledge into the heads of those who cultivate it? Now on those points he was happy to say that he could speak very favourably. But what inducement had they to make these exertions? They grow corn enough—they have no want of agricultural produce as we have: but when he told them what was the condition of New England in reference to the Western States they would understand. All the new states—all the virgin land where wheat was cultivated—yielded a crop for little or nothing, but it could not yield by any means a large crop. In the state of Michigan, between Lake Superior and Erie, the average produce was not twelve bushels an acre; but it was got for nothing. In New Brunswick, which was very thinly populated, he was told that ten bushels an acre paid well—but the produce was not large. In the Western States they were unable to produce it very cheaply. At the time I was there the prices varied from 60 to 80 cents a bushel—that is, 100 cents being 4s. 4d. In the extensive Western States and part of New York, where it was shipped to England, the price varied according to the distance. Now, the condition of things in the Western States in reference to England was precisely the same as the condition of England in reference to the wheat-producing countries of the Baltic. The condition of the farmers was exceedingly bad, and in Maine he was informed that they were all in a state of bankruptcy. The land was all mortgaged, which hung like a millstone round their necks, and was worse even than the state of the farmers in this country. They were thus unable to compete with the western parts of New York or Lake Ontario. They had all heard of the famous wheat of Genesee, where the land was more fertile than in any part of Great Britain, and he learned there that they were laying the land down to grass, because they could not afford to grow wheat. As a remedy for this state of things they were establishing agricultural societies in the different states, and the legislature was providing funds to support these societies and for the diffusion of knowledge. Let him now come to another point of great importance, and to which they would perhaps like him to advert—namely, what will be the effect of an improved condition of agriculture in America upon us—what influence will the growth of wheat in the States have upon us—or what influence is the progress in agriculture, consequent on this great desire for improvement, likely to have upon the state of agriculture in Great Britain? In New Brunswick, New England, Vermont, New Hampshire, Connecticut, and New York, the growth of wheat has almost ceased; and it is now gradually receding farther and farther westward. Now when he told them this, they would see that what he believed to be the case was really the case: that it would not be very long before America would be unable—in fact the United States were unable now—to supply us with wheat in any large quantity. If we could bring Indian corn into general use we might get plenty of it; but he did not think that the United States need be made any bugbear to them. He believed the great source of competition they would have to contend with was the Baltic and the countries on the borders of the Black Sea. Now, in regard to the other point—namely, what effect will the desire for improvement in agriculture have upon the agriculture of this country?—it ought to stimulate us to still greater exertion. Sure he was, that with proper exertion, we would always keep a-head of them. There was as good blood in this country as ever went out of it. He hoped English and Scotch heads and hearts would not become languid and dull on a matter of such moment as this, but that they would continue to beat them, as he was sure, from what he had seen, that they were able. What the Americans did well, we ought to be able to do better.'

THE ANGLO-SAXON RACE.

In 1620 the Anglo-Saxon race numbered about 6,000,000, and was confined to England, Wales, and Scotland; and the combination of which it is the result was not then more than half perfected, for neither Wales nor Scotland was half-Saxonised at the time. Now it numbers 60,000,000 of human beings, planted upon all the islands and continents of the earth, and increasing everywhere by an intense ratio of progression. It is fast absorbing or displacing all the sluggish races or barbarous tribes of men that have occupied the continents of America, Africa, Asia, and the islands of the ocean. If no great physical revolution supervene to check its propagation, it will number 800,000,000 of human beings in less than 150 years from the present time—all speaking the same language, centred to the same literature and religion, and exhibiting all its inherent and inalienable characteristics. Thus the population of the earth is fast becoming Anglo-Saxonised by blood. But the English language is more self-expansive and aggressive than the blood of that race. When a community begins to speak the English language it is half-Saxonised, even if not a drop of the Anglo-Saxon blood runs in its veins. Ireland was never colonised from England like North America or Australia, but nearly the whole of its 7,000,000 or 8,000,000 already speak the English language, which is the preparatory state to being entirely absorbed into the Anglo-Saxon race, as one of its most vigorous and useful elements. Everywhere the English language is gaining upon the languages of the earth, and preparing those who speak for this absorption. The young generation of the East Indies is learning it; and it is probable that within fifty years 65,000,000 of human beings of the Asiatic race will speak the language on that continent. So it is in the United States. About 50,000 emigrants from Germany and other countries of continental Europe are arriving in this country every year. Perhaps they cannot speak a word of English when they first land on our shores; but in the course of a few years they master the language to some extent. Their children sit upon the same benches in our common schools with those of native Americans, and become, as they grow up and diffuse themselves among the rest of the population, completely Anglo-Saxonised. Thus the race is fast occupying, and subduing to its genius, all the continents and islands of the earth. The grandson of many a young man who reads these lines will probably live to see the day when that race will number its 800,000,000 of human beings. Their unity, harmony, and brotherhood must be determined by the relations between Great Britain and the United States. Their union will be the union of the two worlds. If they discharge their duty to each other and to mankind, they must become the united heart of the mighty race they represent, feeding its myriad veins with the blood of moral and political life. Upon the state of their fellowship, then, more than upon the union of any two nations on earth, depends the well-being of humanity, and the peace and progress of the world.—*American paper.*

RATS FOR THE TABLE.

There are parts of the world besides China where even rats are eaten, and such rats as would astonish those accustomed to the British species, which, take even the largest, are Lilliputian as compared with a native of the East Indies, first satisfactorily described by General Hardwicke in the seventh volume of the 'Linnæan Transactions.' The specimen he described was a female, and weighed two pounds eleven ounces and a-half; its total length being two feet two inches and a-quarter. He assures us that the male grows larger, and weighs three pounds and upwards; so that the natives have before them on table an animal as large as a wild rabbit, and doubtless, as they have no prejudices or scruples, just as palatable.—*White's Popular History of Mammalia.*

PROGRESS.

There is nothing so revolutionary, because there is nothing so unnatural and so convulsive to society, as the strain to keep things *fixed*, when all the world is, by the very law of its creation, in eternal *progress*; and the cause of all the evils in the world may be traced to that natural, but most deadly error of human indolence and corruption—that our business is to *preserve*, and not to *improve*. It is the ruin of us all alike, individuals, schools, and nations.—*Dr Arnold.*

THE NECROMANCY OF THE PAST.

BY CALDER CAMPBELL.

FRUITS seem sweeter when the season
Of their flourishing is o'er;
Scenes are fairer, for the reason
That we ne'er may see them more.
Oft amid an orchard, swelling
With red, fragrant apples, I
Languish for that Indian dwelling
Where my eager youth went by:
Languish for the mangoes golden—
Sweet guavas, pink at core—
Or pomegranates, inward holding
Crimson kernels in rich store!
Papaws, in the sunshine, yellow,
Clustering thick 'neath foliage broad—
Plantains, primrose-hued and mellow—
Tamarinds that shroud the road;
Custard-apples, white and milky,
With a food most like their name—
Sweet rose-apples, odorous, silky,
On a tree of stalwart frame;
Figs, the coolest fruit that quenches
Fevered lips 'neath tropic skies;
And such flowers as no dew drenches
'Neath our northern Flora's eyes!

Wherefore prize the things we have not
Thus above what we possess?
These were mine, yet *then* they gave not
To the mind contentedness!
In those days, I do remember
How I longed for British land:
The very snows of home's December
Warmed 'neath fancy's genial hand!
Cowslips from the mead, primroses
Gathered from the hillside dew,
More I prized than brightest posies
Gleaned 'neath skies of cloudless blue!

When the babool's perfumed blossoms
Swung their goldlike tassels near,
I bethought me of kind bosoms
Decked with pinks and violets dear;
And the moogra, white and fragrant,
Twined 'mid hair as black as night,
Seemed to fancy's dreamings vagrant
Neither half so sweet or bright
As the snowy lilies, treasured
In our early summer day:
Ah! how seldom things are measured
Justly, till they pass away!

For the absent ever longing;
On the past still heaping praise;
Bitterly the present wronging
With complaint's insensate lays;
We but throw athwart the future
Shadows, sure to brood when all
Echo's sweetest songs are muter
Than torn Silence in her hall!
Why is this? Why place such value
On life's vainly-squandered gold?
Why, when gentle voices call you,
Turn to those now dumb and cold?
Why, when evening's shadows round us
Paint the fields of youth no more,
Scorn the wreaths that may have crowned us
For the thorns within their core?

Subtleties of the affections
We may question, aye in vain,
Making still our heart-elections
'Gainst decisions of the brain.
God hath given us tastes and feelings;
And to regulate their choice,
We must look for such revealings
As *His* will alone employs!

Theories that prate of reason
As a study taught by men,
Are like sudden schemes of treason
Planned within a lion's den:
One fierce, passionate experience
Proves how fallacies are crushed,
Just as traitor-tongues, at variance,
'Neath the lion's paws are hushed!
Love, and joy, and innocent likings,
Have their laws for hearts, not heads:
The spider web of metaphysics
Honest feeling tears to shreds!

SATURDAY, JULY 27, 1850.

PRICE 1½d.

A BREACH OF CONFIDENCE.

I do not want a wife—at least at present. I am not seven-and-twenty, but thirty-four: and I have not L.300 a year (nor indeed 300 pence) independent of my profession. It is essential that these statements should be understood, for the better comprehension of the scheme of villany in which I have been, and am at present, engaged.

Furthermore, I believe my handwriting has already, more than once, given many persons reason to form a tolerable conception of my character, without the aid of a graphiologist. And as to my self-knowledge, I understand my own disposition pretty well. I am perfectly aware of my faults when at times I know I am doing an absurd, selfish, ill-judged, cowardly, illiberal, or at least doubtful thing. This keeps one half of my disposition in constant warfare with the other. Sometimes the *âme* is powerful enough to conquer the *bête*: sometimes the former miserably gives in. However, suffice it to say, that, from practical reasoning, I know most of my failings: indeed my better-half (of my disposition) occasionally murmurs, 'You have said a sharp unkind thing, and hurt another's feelings wantonly, and without chance of appeal;' or some similar chiding: and then I am sure to suffer far more within me than the aggrieved. With all this, I do not want anybody to teach me what I am: more especially for a shilling.

I am not by any means a sporting character. I never made a bet in my life, beyond a hopeless pair of gloves. In the course of a tolerably active career, of that unsatisfactory and wearing-out kind known as 'upon town,' I never saw a prize-fight: nor, judging from the hideous and unsavoury ruffians I once fell amongst returning in a train from the battle-field, have I any wish to. As to racing, the fluctuations of betting are a greater puzzle to me than the politics of Central Europe. This very last Derby Day—on the 'hill,' in a good position, and surrounded by friends who bawled themselves bloodshot as *Voltigeur* thundered along the turf—I never saw the race. I was engaged in conversation at the time with something a great deal more interesting; and, on being informed by a friend (who was standing on three cushions, put on a hamper, and elevated finally on the seat of the box) 'They're off!' with a vehemence that nearly shook him over, I replied, 'Oh, are they? I daresay it's all right,' and continued my conversation.

'But what do we care about all this?' ask my readers, I have no doubt, by this time. A moment's patience, if they please, until I explain, simply, that, from mere idleness and curiosity I have been lately having a great deal of quiet fun to myself amongst the strange advertisements of the day, relating to the above and other

topics. And some of the odd things that have come under my notice I am anxious to bring before them.

A few weeks back, at the expense of a guinea, I drew up and inserted the following advertisement in one of the most popular of our London weekly papers. I reversed my initials—made my bookseller my accomplice by requesting him to receive the answers—and was fortunate enough to get a place at the top of the best column, above two others of a similar nature:—

MATRIMONY.—A Gentleman, aged 27, of good education and connexions, with an income of L.300 a year, independent of his profession, is desirous of forming a Matrimonial Alliance. The lady must not be older than himself, of pleasing manners, and conversant with the usages of society. Property is not so much looked for as an agreeable companion, in whom also a knowledge of music or singing would be desirable, but not indispensable. Ultimate happiness and benefit to both parties is the sole object of this advertisement, and answers will meet with every attention. Addressed, prepaid, to S. A., Library, 42, Tottenham Court Road, London.

At the same time I replied to various other advertisements: but my business at present is with the matrimonial one.

It appeared in the Saturday edition of the paper, and on Monday morning I had two answers. Seven more came in the evening—four more on Tuesday, and two on Wednesday, when they ceased, amounting altogether to fifteen. I believe most of these to have been, *bonâ fide*, seriously sent. Let us now see the nature of these communications.

But firstly, in my own defence, in case I should be attacked with the charge of acting dishonourably towards my fair correspondents—more especially as several of them almost demand secrecy—let me state that I believe myself fully justified in publishing their effusions, in order that the lesson may not be without its moral. The 'ultimate happiness and benefit to both parties' mentioned as 'the sole object of the advertisement' may yet be achieved. When a woman, in whatever position of life she may be, so far loses all caution and sense of position as to reply to an anonymous communication, she must abide by the consequences. The folly of such a proceeding cannot be too severely reprehended, or, as in this instance, punished. In my case the 'L.300 a year, independent of my profession,' was evidently the bait. Why should a young man in the favourable position which I assigned to myself be driven to advertise for a wife? Was I an oaf, unfitted for the manners of polite society, or did any moral taint hang about me that quarantined my entrance into its circle? Was there no one amongst my 'good connexions' who would have me? What were the chances that I was not a swindler, a broken-down *roué*, a fiend in temper and person, a villain generally, or perhaps already married? I had said nothing about references—they were neither given nor required: did this look like an

honourable transaction? And how could it be supposed that any man would risk the future comfort of his entire life on an acquaintance with disposition and character formed on the questionable judgment of an anonymous rendezvous?

But to the replies: and here they are, transcribed most faithfully, with every peculiarity of orthography and punctuation copied. The words printed in italics were underlined in the originals; and, as is usual in female correspondence, betray a singular emphasizing of those entirely unimportant. When initials are used, I have changed them.

The first was written in a bad hand, which the writer had tried to make dashing by flourishes:—

'Sir—Having seen your advertisement in the ——— and wishing to enter into the holy state

'I am a perfect mucian both Instrumental and vocal and equally domesticated should this meet your *views* please to address ———.

Mr S. A.'

The next was better in the penmanship, and slightly scented: it was delivered with the preceding one:—

'Let me unplore of you not to think me immodest but your frank advertisement impels me from its Gentlemanly tone to think in you a consummation of my wishes may be found, remember that I rely implicitly on your honor when I thus confide I am 21 years of age of excellent family and am moving in an unexceptionable sphere. It would ill become me to speak of my beauty my figure tastes habits manners accomplishments or aimability of disposition nor should it be my task to pourtray the intellectual acquirements which are thought to enhance the value of all such gifts suffice it they have been enough to procure me many enviable offers but amongst them all there was not one whom I could truly love and none shall have my hand unaccompanied by my heart yet I have often longed for one to love and look to and to cling to with a woman's first affection. I snatch a few moments only left to our sex in the after dinner Drawing room or I would say more Answer this and be discreet as you are secret for I risk much in thus outstepping womans bounds through my desire to know you fully, Adieu.

'Address ———.'

If this silly girl comes to see her epistle thus in print, she will learn at the same time how absurd must have been her fiddle-faddle sentiment, that created anything to 'cling to' in the unknown writer of a really very commonplace advertisement.

The next has higher pretensions:—

'Sir—If conquering the natural repugnance a woman must not unnaturally feel in replying to a matrimonial advertisement such as I now adventure upon she boldly braves the world's opinion and answers it what can she expect? scorn contempt and silence? Such would be the answer of many or of most, but such would not be could the inward workings of a much tried and long suffering heart be laid bare to the gaze. I would beg of you to believe that nothing but faith in manhood's truth which I would fain think would not wilfully trifle with feminine unprotectedness could prompt me to this step. I have for the last twelve years been thrown upon the world constrained to seek my bread upon the troubled waters of human life, and neither the strength nor the opportunity has been denied me. In years I number 29 summers, in person not unattractive, and for money I have nearly five hundred pounds and for my mental qualifications the fact of my having been for five years instructress to the ladies of ————Esq' of

—— and other noble families must vouch. I can say no more, but destroy this letter and let no evidence remain of the weakness of, Sir,

yours,

E. M.

'Should you entertain this reply I will meet you in St ——— Park, on Wednesday evening after seven and before eight o'clock. I shall wear a Barège dress, blue with white stripe primrose coloured bonnet with feather and fall, and should you have a geranium in your coat I will accost you.'

There was something very displeasing in this letter—the attempts at 'fine' writing, and trash about 'manhood's truth,' and 'feminine unprotectedness,' more than counterbalanced the five hundred pounds. I hated also the sentence, 'In years I number 29 summers.' Why could not E. M. say she was nearly thirty?

No. 4 came to the point at once, as follows:—

'Miss F—— will be most happy to meet S A in ——— Square, on Thursday evening at 6 o'clock: Miss F will be dressed in a white silk bonnet, glacé silk cloak and dress, and will walk between the Nos. 30 and 48.'

This was written in a nice ladylike hand; so was No. 5, but hazy in composition, and without a stop the whole way through:—

'A lady aged 24 years possessing an amiable disposition agreeable manners and personal attractions would be happy to have an interview with the advertiser and the object may perhaps be best attained should he feel inclined to walk in the Clapham Road near Kennington Gate between the hours of 3 and 4 tomorrow afternoon and in order that no mistake should occur he should wear a piece of scarlet geranium in his button hole and carry an umbrella and should a lady inquire of him the way to Clapham he may conclude it is the writer To prevent *misunderstanding* she thinks it necessary to state that she has not any property and that she is a good musician and Vocalist.

June 26th.'

It is odd that two of the ladies should fix on a geranium as a mark of recognition. With these ready appointments on their sides, the wonder becomes, not so much that they should trust the author of the advertisement, as that they should think him likely to choose a companion for life under such circumstances. No. 6 was as follows:—

'Sir—In answering your advertisement in yesterdays Times respecting a matrimonial alliance I venture to treat with you for being left an orphan I find that I want a kind protector and one who would really make me his companion. My Age is twenty-five. I cannot boast of any property at present. My Education has been good but plain and without accomplishments I have been accustomed to the usages of society having lived as companion to a lady for several years Should you feel disposed to take any notice of this please to address to F. B. N. Post Office ——— St. St James's.'

No. 7:—

'E. N. F.—a young lady aged 22, of a highly-respectable family, residing in ———, being desirous to settle in life, with a view to render the home of some kind and worthy individual "cheerful and happy" will have no objection to an introduction to S. A, believing his advertisement to be candid and honourable, should S A feel disposed to answer this, address ——— Post Office ——— until called for.'

'The writer of this does not sing or play, but the family is very musical.'

Even had I been inclined to have had my home rendered 'cheerful and happy' by the writer of the above, there was something uncomfortable in the notion of the musical 'family;' and the wording of the letter almost suggested the idea that I should be obliged to marry them all, thus bringing a concert about my ears that would soon have promoted discord. No. 8 was certainly more satisfactory, albeit its fine crowquill hand took some trouble to decipher. It ran thus:—

'A young lady under 27 of good connexions and well educated, voice generally considered pleasing and fond of music, with a small income at present, anticipating property at a future period, fond of literature and retirement, (though if not presuming on being explicit in offering her sentiments, she considers vivacity at times agreeable and efficacious in smoothing the roughness of our path in this world) can meet S. A. in front of the — church, on Friday evening, at 7 o'clock.'

No. 9. was brief and inexplicit. It was written in a hand very like that used in making out manuscript washing bills; was entirely without stops, and betrayed some ignorance of composition, as will be seen:—

'Sir trusting you will excuse the liberty I have taken in intruding myself to your notice or writing to a stranger which is indeed very unlike me I am only on a visit from the country may I wait your reply in sincerity and truth your real sentiments and am yours respectfully

M. B. A.

'Address, post office —.'

No. 10 was equally deficient in detail, but better written. The lady had, however, odd notions of capitals, which were used as shown:—

'Sir—It is with great reluctance I assure you that I take the liberty of Addressing you without the Introduction generally expected on such Occasions but I am happy to say my Character is such that it will bear the Strictest investigation and my Family is respectable your answer will Oblige your Obedient Servant S. J.

'Address, Post Office — road.'

There were two or three followed in the same style—written in neat feminine hands, all claiming to be under 25, with a slight knowledge of music, and expectations of small sums. One expressed a long-felt wish 'to be united to a party of gentlemanly habits and good family.' Another requested that all letters might be posted (an address was given, and I found from 'Kelly's Directory' it was a correct one) so as to arrive between 11 and 4: I presume whilst the father or guardian was 'in the city,' as it was dated from a suburb.

No. 14 was, to my thinking, the most agreeable of the lot. It was beautifully written, and well punctuated:—

'Sir—Having seen your advertisement, allow me first to state my age which is twenty-one. I am generally considered to be possessed of pleasing manners; but that, of course, may be owing to the partiality of friends. I possess but a very slight knowledge of music, but for the gratification of a person I loved should be but too happy to acquire it; and last, but not least to be mentioned, is what I fear may prove the barrier to a further acquaintance—namely, that my hand and heart are all I have to offer. Possibly some pecuniary arrangement may be necessary to your views, if so permit me to wish you a successful termination to your suit, and to remain

Your unknown correspondent

L. S. A.

Should you deem this worthy a reply, address to me at

the Post Office. —. Pentonville, to be left until called for.'

I was almost sorry that, to all appearances, so nice a girl should have answered the advertisement; but this public reproof—private so far as she herself is concerned—will do her good.

The last was the longest, and the writer laid some claims to being a poet. The hand was good, and apparently known to be so, for the letter was written with care: but it was on embossed paper—such as we see valentines on—and sealed with fancy wax. Let us see what it said:—

'Sir—Having seen an advertisement in the — of last week, from a gentleman requiring a wife, permit me to offer myself as a candidate.

'I am the eldest daughter of a highly respectable tradesman, carrying on an extensive business at the West End. I am of a medium height, prepossessing appearance and lady-like manners: and I may say, without presumption, that it is my good fortune to be gifted with three choice blessings—excellent health, a sweet temper, and a contented disposition. My age is twenty three, and I am of the established church. I have been well educated and accustomed to good society; and am thoroughly conversant with all necessary household duties. My friends and connexions are of the highest respectability. With regard to pecuniary affairs I have not any settled income at present, being at home with my friends.

'Should you think this communication worthy of notice you will oblige me by addressing a reply to

F. C. L.

Post Office
Brook St.'

(The following lines were enclosed:—)

'In choosing a Husband, the man to my mind,
Must be sensible, gentle, benevolent, kind;
Of a temper quite firm, yet devoid of self-will,
If on good once resolved, pursuing it still;
Of a spirit so great as to keep out of debt,
And at troubles unsought for, disdaining to fret.
I'd have him be lively, yet not void of thinking,
All gaming detesting, and not fond of drinking,
With a heart to enjoy what his hands may have got,
Contented and cheerful whatever our lot;
I'd have him esteemed by the good and the wise,
Not a man of the world, though striving to rise;
He must love me too well, at small errors to frown,
And with me at his table sit happily down.'

Here, then, ended my correspondence. Seriously, it was somewhat depressing to see so many aspirants to an imaginary hand: and I began to think there was some truth in a theory lately started in society, that husbands are becoming extinct. As I have stated, all these letters had an air of truth—there was no attempt at disguised handwriting in any of them: and they were evidently penned by females. To these, I would now repeat my opinion of the silliness of thus replying to the advertisement.

Let them think, for one minute, of the risk they ran in so doing. Suppose—and nothing would have been easier—I had handed over their letters to any of my young men friends, and told each to pursue the subject and see what came of it, for another article: how seriously they might have been compromised!

Or suppose, again, that I had given them all an appointment, at the same time, in the street before my house, and then sat at the window with my friends, for our amusement. Worse jokes than this have been played upon persons less culpable of running their heads into a trap. Fortunately for them I had a fixed serious

purpose from the beginning: and this I kept entirely to myself until the present moment. Nobody has seen the letters but myself, and they will now be destroyed, so that all traces of the writers will be obliterated. Their contents will only appear in this present warning: and I trust that my fair countrywomen will profit by it: and regard me rather as a friend, than a betrayer, of 'unprotected females.'

So much for my advertisement. My other experiences have been gained from those that I have answered myself: and a wonderful new world they have opened to me. Certainly the old proverb, that one-half of us does not know how the other lives is far above the mark: rather say one quarter knows nothing of the other three.

LONDON GOSSIP.

July 1850.

THE dispersive quality of heat is well exhibited here, in the mighty capital at this time: the fervour of a July temperature is too much for even metropolitan allurements. From the Queen of the realm to the queen of the household, all who can are on the wing, or giving the preparatory flapping. Other as well as canine noses scent the game: the Opera and the season are both sighing their last; there are no more feasts, and so sportsmen are speeding northwards for moorfowl. Cheap excursion trains, and trips to the continent, enable not a few for a brief period to shake off the 'strong urgencies' of business, and recruit themselves for another twelvemonth of toil. While those who cannot or will not flit, creep about in the stripe of shade wherever they can find it, with the bewailing remark, 'How empty town is!'

Gossip is, therefore, as may be expected, desultory, and I can promise you little more than sundry gleanings, the last of the season. Whether they can be made to serve with dilution until the stir begins again, remains to be seen. Our learned and scientific societies have begun their long vacation after crowding all arrears of work into their last evening meeting. At the Civil Engineers, papers were read on lattice, lift, and tubular bridges, on malleable iron, railways, and locks and keys. It appears that the oldest lock known is of Egyptian manufacture; its age is 4000 years: Chubb has not so much to boast of after all; notwithstanding that his locks with six tumblers are capable of 86,400 different combinations, which number, by a very slight change in the key, is increased to 864,000; and taking the three different sizes of keys, the whole number of changes would be nearly 8,000,000. Another paper was about 'printing machines.' On which subject we are told that 'on the 7th May 1850, the Times and Supplement contained seventy-two columns, or 17,500 lines, made up of upwards of a million pieces of type, of which matter about two-fifths were written, composed, and corrected after seven o'clock in the evening. The Supplement was sent to press at 7:50 P. M.; the first form of the paper at 4:15 A. M., and the second at 4:45 A. M.; on this occasion 7000 papers were published before 6:15 A. M.; 21,000 papers before 7:30 A. M.; and 34,000 before 8:45 A. M., or in about four hours. The greatest number of copies ever printed in one day was 54,000, and the greatest quantity of printing in one day's publication was on 1st March 1848, when the paper used weighed seven tons, the weight usually required being four and a-half tons; the surface to be printed every night, including the Supplement, is thirty acres: the weight of the fount of type in constant use is seven

tons; and 110 compositors, and 25 pressmen, are constantly employed.' Besides this power in living muscle, there are three machines of four cylinders each, and two with vertical cylinders, all employed in manufacturing news for the four quarters of the globe.

A batch of papers was read at the closing meeting of the Royal Society; among them an important one by Mr Newport on the generation of reptiles, in which some hitherto-unsettled points are determined; one also by Lord Rosse on the nebulae as they appear in the reflector of the monster telescope. One of them, spiral formed, is a most extraordinary and magnificent object, inciting to grand speculation on stellar formation and movement. We are to know something more about these by and by, if the sky and the atmosphere will but be propitious. To descend from celestial to terrestrial matters: Faraday has given a lecture at the Royal Institution on the 'philosophy of water and ice.' A huge lump of Norway ice which stood before him served him for illustration and experiment. Perfect ice contains no air; it behaves in certain cases as airless water does, which will not boil until heated to 300 degrees, and then it explodes; so ice explodes when melted and boiled under oil; as the lecturer showed by small lumps dissolved and heated in flasks. Pressure, too, has much to do with thawing and freezing: under very great pressure, water will not freeze at 32 degrees.

Of course you know—at least you and every one else ought to know—that the bill to abolish intramural interments has passed the Commons: the sooner it becomes a law the better. The Sewers' Commission are at work: they mean to commence their great task of drainage on the 'Surrey side:' this is as it should be, the worst first. And we are promised that from Vauxhall down to Deptford no sewer shall discharge its contents into the Thames. The grand outlet for the south bank will be below Deptford, and contrived so as to flow only at the fall of the tide. If saving the river from pollution is to be the essential principle of the new system, we shall have good reason to congratulate ourselves. We are told, too, that no needless delays will occur; that 580 miles of sewer have been surveyed and levelled on the north side; that 100 miles more remain to be done; that the survey map will comprise 900 sheets, 270 of which are engraved, and all the rest in hand, besides 44 sheets of the reduced map. If the Commission do really perform their promises, they will better deserve to hoist the besom as their standard than did the doughty old Dutchman Van Tromp.

Philosophers abroad are working diligently at many interesting branches of physical science: magneto and muscular electricity, dia-magnetism, vegetable and animal physiology: Matteucci in Italy, Bois-Reymond, Weber, Reichenbach, and Dove in Germany. The two maps of isothermal lines for every month in the year, lately published by the last-mentioned *savant*, are remarkable and most valuable proofs of scientific insight and research. If they are to be depended on, there is but one pole of cold, situate in Northern America; that supposed to exist in the Asiatic continent disappears when the monthly means are taken. These maps will be highly useful to the meteorologist, and indeed to students of natural philosophy generally, and will suggest other and more extended results. Among the memoirs brought before the Natural History Society of Vienna, is one by M. Frauenfeld on 'the limits which nature puts to the too great abundance of insects.' The great differences in the numbers of insects in different seasons is attributed by this author in great part to the unequal proportions of the sexes. When females predominate, the species will be very abundant the fol-

lowing year; but as nature never permits a permanent disturbance, the equilibrium is re-established, and in turn the males are most numerous, which reduces the species to infinitely weaker proportions. Another cause consists in contagious maladies, which, according to the seasons, attack some, and spare others. Variations of temperature, the absence or presence of snow, unequal numbers of insectivorous birds, are also causes of irregularity in the numbers of insects; and last, the unequal appearance of one species generally produces an unequal appearance of another to feed it off.

A communication from M. Trémaux, an Abyssinian traveller, has been presented to the French Academy by M. Geoffroy St Hilaire: it gives an account of the sudden difference which occurs in the races of men and animals near Fa Zoglo, in the vicinity of the Blue Nile. The shores of this stream are inhabited by a race of Caucasian origin, whose sheep have woolly coats; but at a few miles' distance, in the mountains of Zaby and Akaro, negro tribes are found whose sheep are hairy. According to M. Trémaux, 'the differences and changes are due to two causes: the one, that vegetable nature, having changed in aspect and production, attracts and supports certain species, while others no longer appear, or the individuals are fewer. As for the second cause, it is the more surprising, since it produces opposite effects on the same point: where man has no longer silken, but woolly hair, there the sheep ceases to be covered with wool.'

M. St Hilaire remarked on these facts, that the degree of domestication of animals is proportional to the degree of civilisation of those who possess them. Among savage people dogs are nearly all alike, and not far removed from the wolf or jackal; while among civilised races there is an almost endless variety—the greater part far removed from the primitive type. Are we to infer from this that negroes will cease to be negroes by dint of civilisation—that wool will give place to hair, and *vice versa*? If so, a wide field is opened for experiment and observation.

M. Flourens, secretary of the Academy, communicates some particulars relative to the action of certain substances when injected into the arteries. He finds 'that some act on the motive power (*motricity*) only: these are sulphuric and acetic ether, &c. camphor, chloroform, essences of turpentine, mint, and rosemary. Others act on the sensibility without affecting motricity: these are bases of the lycopodæ, hemlock, &c. And further, that the substances which bring on muscular paralysis, some (the ethers above-mentioned) produce the effect by causing a relaxation of the muscular fibre; while such as chloroform cause the paralysis by a tetanic contraction of the muscles. Apropos of this part of the subject, the author of a paper read before the Royal Society at its last meeting, shows that animal growth, in common with vegetable growth, depends on the formation of cells—that cells cannot be formed without the presence of phosphate and oxalate of lime; consequently that the exhibition of phosphate of lime is the remedy for wasting of the muscular fibre, or loss of flesh.

During the past winter Biot worked for several months at a series of careful experiments, to prove that water, when approaching its point of congelation, has no influence on polarised light, and demonstrates its negative in a very satisfactory manner. The effects of certain liquids on the phenomenon in question had led to the supposition that a freezing liquid would show similar results: but now the question is set at rest; the experiments, as Biot says, were made with such scrupulousness, they will not need to be repeated. M. Latour states that inflammatory diseases of the skin may be cured by maintaining the part at a low temperature, and excluding the action of air; and for the latter part of the process, proposes the application of an impermeable coating. A method of preventing the entrance of flies into a room is put forward by M. Delamarre. The plan is, to stretch a net across the open

window or door, which proves an effectual barrier, although the meshes may be sufficiently wide to afford a passage—a fact explained by the supposition that the flies fear a snare. Let me complete these foreign gleanings by two domestic items—the one that, according to the Lancashire central committee, Mechanics' Institutes are more and more declining; the working-classes shun them—a proof, is it not, that those associations do not supply the want felt, or supposed to be felt, by mechanics? And the other, that a project is talked of for rapid steam communication from Holyhead to Dublin by means of a steamer of 12,000 or 15,000 tons burthen, 1200 horse-power, which is to make the passage in three hours, and by its steadiness in the water, preserve the passengers from seasickness.

Our astronomical circles have been set on the *qui vive* by a paper just published in New England on a new theory of planetary movement and perturbation. The setting forth of such a question in the present day may be compared to a throwing down of the glove in the days of knight-errantry; it is straightway picked up by a host of competitors, and is tested and discussed in twenty different ways till its true character has been demonstrated. Ethnology, too, is a subject which our transatlantic neighbours are taking up with their accustomed vivacity; some of their theories are entirely opposed to that of the late Dr Prichard. Dr Morton has laid before the Academy of Natural Sciences of Philadelphia a paper containing the results of his long-continued researches on the size of the cranium. He has examined and measured 623 skulls of different races, and concludes therefrom that—1. The Teutonic, or German race, embracing, as it does, the Anglo-Saxons, Anglo-Americans, Anglo-Irish, &c. possess a larger brain than any other people. 2. The nations having the smallest heads are the ancient Peruvians and Australians. 3. The barbarous tribes of America have a much larger brain than the civilised Peruvians or Mexicans. 4. The ancient Egyptians, whose civilisation antedates that of all other people (Mr Layard says otherwise), and whose country has been justly called 'the cradle of the arts and sciences,' have the least-sized brain of any Caucasian nation, excepting the Hindoos; for the very few Semitic heads will hardly permit them to be admitted into the comparison. 5. The negro brain is 9 cubic inches smaller than the Teutonic, and 3 cubic inches larger than the ancient Egyptian. 6. The largest skull in the series is that of a Dutch gentleman, and gives 114 cubic inches; and the smallest, 58 cubic inches, belonged to an old Peruvian, the difference between these two extremes being not less than 56 cubic inches. 7. The brain of the Australian and Hottentot falls far below the negro, and measures precisely the same as the ancient Peruvian. And last, it appears that whatever may be the distortion, the capacity is not altered. These facts are curious, and valuable so far as they go; the doctor's conclusions have, however, been disputed, so for the present their true scientific value is not established. In how far they assist the great question of the unity of the human species remains to be proved. In Germany another branch of the subject has been taken up in two works published at Halle: one, a 'dissertation on the country inhabited by the Celts, upon the affinity of their language with that of the Indo-Germanic populations, and the influence which their mythology had in the formation of the legends of the middle ages;' the other is 'Considerations on Celtic antiquities, on the Celts in general, and principally on the Celts in Germany,' &c. So you see an inquiring spirit is at work, which is not likely to rest till some further light has been thrown on the subject.

There is nothing especially notable in the way of literature. 'Tours,' 'Travels,' and 'Wanderings,' in rather more than the usual sprinkling, have, it is true, been thrust into print; but one is at a loss to know with what object, unless it be to show in how many

variations a guide-book may be produced. Albert Smith's 'Month at Constantinople' is spoken of as a pleasant exception, one that discusses the obverse and reverse of travel with no little philosophy and shrewdness. All by itself stands Alfred Tennyson's new volume, 'In Memoriam': the first edition was all sold in two or three weeks. Its publication has added to the author's reputation, and widened the circle of his admirers. The way in which the spirit of the poems rises from the despair of grief to the hopefulness of resignation is touching, true, and beautiful, and will waken responses in many a heart. The individual whose death is therein lamented in such mournful music was the son of him to whom we are indebted for the History of the Middle Ages. It will be news to many to learn that the poet has ceased to lead a single life, and entered on that domestic state whose joys he has more than once described.

You will perhaps remember my telling you some time ago of the prize awarded to Max Müller by the French Academy for his philological essays? we have now something further from the same learned author: 'The Rig-Veda-Sanhita, the Sacred Hymns of the Brahmins;' or Veda of Praise. These writings are said to be some of the very oldest examples of literature, perhaps more ancient than the Hebrew Scriptures; and when the intimate connection between Sanscrit and the languages of Europe is borne in mind, some idea may be formed of the value of such a work to the philosopher, philologist, ethnologist, historian, &c. Being printed in the original character, it is of course beyond popular comprehension, or elucidation except by a scholar. Dr Müller, however, will himself in some measure smoothe the difficulty, as he is about to publish on Sanscrit, and the relation of other languages to it, a task for which his labours have well prepared him. The Brahmins, it is said, at first threw many obstacles in the way, refusing to furnish necessary manuscripts; but their scruples were at last overcome. This volume, which is the first of four, to be all of equal bulk, comprises a thousand pages: the author has been at work upon it for five years, and has diligently availed himself of the resources in the libraries of Paris, London, and Oxford. It is published at the charge of the East India Company, who have very praiseworthy presented copies to numerous learned and scientific bodies at home and abroad.

Foreign literature—French and German—is beginning to be less charged with elementary works on political and social economy than of late. It would appear that notwithstanding all our vaunted progress, we need to be continually reminded of first principles—of what is right and wrong in regard to ourselves and others. One of these works—'Harmonies Economiques'—has just been published by M. Bastiat, a name favourably known in this country. The aim of the writer is to show 'that in spite of the declamations of certain sophists against the exigencies of society, against the limits opposed to individual liberty, it remains proved that, to develop himself as an intelligent and perfectible being, man requires the co-operation of his fellows; that without this association he would soon perish of hunger and cold in isolation. . . . In a material as well as moral point of view, happiness is relative—it is proportioned to the extent of wants; and to seek for equality in this respect, is to establish a yoke which would be so much the more insupportable, as it is in the nature of man to aspire ceaselessly to the improvement of his condition. In proportion as his desires are satisfied, others spring up not less ardent or imperious; and the social state, in not assigning narrow or insurmountable limits to this ambition, has, at one and the same time, responded to the intention of the Creator, and applied the principle of community in a manner much more fruitful than all the systems proposed as substitutes for it. The object of man's organization is to place himself in harmony with the order which reigns in that of the universe, where we everywhere see variety in unity. But that

he may accomplish this work, free competition must be left to individual efforts. It is here that true equality is found, the only possible, which consists in liberty of action to each one in his sphere, so that he may participate, according to his capacity, in the production and distribution of the social wealth. The greater part of the miseries and sufferings of which society is accused as the author, have no other cause than the numerous obstacles which impede the spring of free competition. Instead of calling on government to constitute itself administrator of all individual transactions, its function should be reduced to the task (sufficiently important) of watching over the public safety, repressing anti-social passions, keeping up and perfecting modes of communication, so that trade may be assured of a more and more complete development.'

One more item and then: Lamartine has published a dramatic poem, 'Toussaint L'Ouverture,' which, as its title indicates, represents the revolution in Hayti. The most stirring scene is that in which the troops under Leclerc arrive from France: Toussaint, desirous of learning their plans, feigns blindness, by turning the whites of his eyes outwards—a power with which the poet endows him—and enters the enemy's camp with a guide. He lives there some time unsuspected, and is one day admitted to the council, to hear a message which he is to convey to himself—the leader of the blacks. A negro captain, one of the rebels, enters, and, from spite, offers himself and his troop to Leclerc, and is about to detail all the plans of the insurgents, when Toussaint, suddenly reversing his eyes, rushes on the traitor, kills him with a dagger stroke, and then plunging into the sea, escapes amid a shower of balls. He joins his army, gives the signal for action, troops rush in, the roar of cannon and rattle of musketry are heard, and with this first crash of battle the curtain falls.

MR ARTHUR'S INFALLIBLE JUDGMENTS.

We had not been long settled in the pretty village of S—, where to us the sunshine seemed brighter than elsewhere, and the spring blossoms more luxuriant, when our father signified that we might expect an immediate visit from Mr Arthur—a gentleman of whom we had frequently heard, but whom we had never seen. This announcement occasioned great excitement among us, seeing that we were spinsters of various ages, which need not be particularly specified; hence it may naturally be inferred that the said Mr Arthur was a young eligible 'match,' or at least not a positively old and obstinate bachelor. Nevertheless, Mr Arthur was old, was a bachelor vowed to celibacy, and, moreover, had no fortune to bequeath on his decease, as he merely enjoyed a life-annuity—a fact he made universally public. Our father always spoke of Mr Arthur with the warmest attachment: they had been friends from boyhood; but we 'girls' ever heard his name with a certain degree of awe attached to it. And now he was actually coming to domesticate with us, to take notes by our hearth-side of our sayings and doings!

As the time appointed for his visit approached, we all became quite nervous and fidgetty, much to our dear father's amusement; nor did he in the least spare our nerves, dilating on the accounts we had hitherto received of this formidable personage, until we almost came to regard him as something 'no quite canny.' Report said that Mr Arthur was so close an observer of character—having devoted his life to the study—that the most hidden things in human hearts were open to his penetration. Mr Arthur did not possess second-sight, he did not prophesy the future; but no mystery or concealment of any kind whatsoever was too deep for his discernment to unravel: in short, his eyes read thoughts and motives as ours read print, and the most wonderful stories were in circulation respecting him. He could pick the black sheep out of the flock, though dyed white for company hours!—he could bring forth the bruised dove which hid its gentle head beneath its wing, and needed, but received

no fostering care!—he could detect the 'falsetto' of a husband's 'my dear,' or a wife's submissive demeanour! Alack for the frailties of human kind, what a set of cowards he made us! But fortunately, while wielding such formidable power, Mr Arthur was said never to exert it unkindly: he was benevolence itself—feared by the bad, and loved by the good.

'And who are the good?' said our Eldest; 'for we each know our secret sins and infirmities, and we dare not call ourselves good, even when striving most to resist evil.'

'Ah, dearest Mary,' we exclaimed in chorus, 'you can have nothing to fear from Mr Arthur's mysterious reading: your heart is a pure unsullied page.' But sister Mary shook her head and sighed.

We revered and loved her as the pattern of all womanly virtue; 'and if she is afraid of being known,' said we, 'what will become of us?' We privately expressed earnest wishes that Mr Arthur were in Australia or at the North Pole; for when with the most finished actresses this wizard always managed to obtain a sly peep behind the scenes, what had we untutored simple lasses to expect? Nothing less than that all our follies, weaknesses, and delinquencies, should be dragged forth and exposed piecemeal!

Great was our surprise, therefore, on first beholding the formidable old gentleman; and vast was our relief when, after a few days' domestication, we came to the conclusion that report had exaggerated in this case, as in many others, and that Mr Arthur was not to be feared after all. Our sister Mary, indeed, said nothing; we could not get her to speak: she only smiled, and answered, 'We must ask Mr and Mrs Sedley here to dinner.'

But before saying a word about this couple, Mr Arthur must be more particularly introduced to notice. He was a small spare person, critically neat in his attire; but with an absolutely silly expression of countenance. This was partly owing to his always having his mouth open—gaping about as it were—with constantly downcast eyes—eyes of the lightest blue when visible—inexpressive and quiet. Mr Arthur always wore his hat on the very back of his head—we often wondered how it kept on at all—his white hairs streaming down to his shoulders. He spoke little, was a great walker, reader of the newspapers, and chess-player, and made himself as much at home with us as if we had all been brought up together.

We detected no covert watchfulness, no stealthy observations, and our suspicions were lulled: we became free and easy, as if no Mr Arthur basked in the sunshine of our dear fireside. Once, indeed, we experienced an alarm: our father and his friend were apparently deeply engrossed with a long-contested game of chess, and two of us girls differing about some trifle, a hasty word was spoken. Our voices were raised but a semitone; but we saw Mr Arthur regarding us from out the corners of his meek blue eyes—furtively, with downcast lids, but still regarding us. We looked at each other, and made our escape from the room as quickly as possible. 'Then it is true after all, and he is reading us!' we exclaimed; but the alarm passed away, and we began to think we must have been mistaken—Mr Arthur was so absent, so devoid of interest in everything going forward around him; while our sister Mary, pursuing the even tenor of her way, unruffled, and in the performance of daily duties, merely said with a pleasant smile, 'Let us ask the Sedleys to dinner.' Now we all perfectly understood what our Eldest meant by asking the Sedleys to dinner, and the inference to draw from it, which was this—that Mr Arthur was a mysterious reader of human kind, and that the Sedleys were to be read by him. However, this by no means set our minds at rest regarding ourselves, though it called off our attention to a subject which had been canvassed among us for many months, with various opinions thereon: this subject was the Sedleys themselves, and their true characters.

They resided about a mile from the village in a dilapidated sort of half-farmhouse called Elder-trees, from the vicinage of many of these trees, surrounding a large dark pool of water, where Mr Sedley bred tench. Elder-trees was a quiet, neglected spot: there was a certain aspect of desolation and hopelessness about it which seemed to hint that in the home something was wanting—something indefinable; but whether a master or mistress's ruling hand, who could say? Mr Sedley was an athletic, finely-formed man of fifty or thereabouts; an amateur farmer and enthusiastic sportsman: he was considered an extremely handsome personage by those who admired a florid complexion, Roman nose, and curling jet hair. These personal attractions were united to a jovial hearty manner, which, if not refined, was not absolutely ungentlemanly: he was a great talker on all topics, and liked to be thought a clever man; our Eldest had found out this weak point. She had also hinted at other failings, but we turned a deaf ear to aught that disparaged our favourite. In short, Mr Sedley was a popular person—his wife quite the reverse: the world is easily deceived by appearances—mere surface-work passes current—whited sepulchres full of dead men's bones! Mrs Sedley was less than half her husband's age, though she had been married many years; she was a pale, young creature, and usually pronounced plain, but with fine eyes. Her manners were nervously timid and cold; she spoke little, and seemed averse to society: matrons shook their sagacious heads, and whispered that they pitied poor Mr Sedley—he had much to endure from his wife's habitual ill-health and peevishness; he spoiled her, indulged her fancies, coaxed and coddled her into fancying herself an invalid! Witness how often, when they were invited out together, Mr Sedley made his appearance alone—pleading headache, or some other convenient ailment, as an excuse for Josephine's absence; and often when Mrs Sedley kept her engagement, swollen eyes, as if from weeping, and manners marked by melancholy, rendered her society more of a bore than a pleasure. Mr Sedley on these occasions evinced great concern and tenderness towards Mrs Sedley; while she—sulky thing! said the ladies—gave no answering sign in return for all this obvious demonstration of affection. Our Eldest was wont to say that she disliked Mr Sedley's eyes—she mistrusted their glance—'for the tongue may deceive,' said Mary, 'but rarely the eye.' We who had been accustomed to see Mrs Sedley only in her quiescent state, were not a little surprised at the change we witnessed one evening when she came to us during the unavoidable absence of her husband on some business matters. Her hilarious laugh, beautiful eyes lit up by animation, and her heightened colour, made us doubt her identity: this gay, pretty creature, the moping, sickly Mrs Sedley? And when, on departing, she gracefully thanked us for a 'happy evening,' there was a tremor and sadness in her voice which seemed to say, 'happy hours are rare with me.' Nevertheless we girls continued to lean towards the side of the strong; and though our sister Mary pronounced Mrs Sedley 'no ordinary being,' we failed to discover any attractions in her silence, pale, jaded looks, and unsocial habits; so we perfectly understood Mary's placid smile when she said, 'We will invite them to dinner, and introduce them to Mr Arthur.'

For once in a way, they both came. Mrs Sedley was looking her best, but not as we had seen her on 'the happy evening'; she sat next Mr Arthur, and contrary to his habit, the old gentleman paid much attention to his timid neighbour, and drew her into conversation. She often glanced uneasily towards her husband; but he, after once or twice regarding Mr Arthur, seemed satisfied with the result of his scrutiny, and gave himself no further concern about his wife, but betook himself to an adjoining apartment where there was a 'rubber' in preparation. We heard Mrs Sedley's low gentle laugh; we heard her sweet voice; and Mary, by a warning look, cautioned us not to disturb the couple,

so pleasantly engaged, and apparently so well pleased with each other. Mr Arthur's face no longer portrayed vacancy; he was earnest, interested, and spiritual; yes, actually spiritual, as he gazed upwards with those deeply-set eyes, and put back his flowing silver locks from his high forehead. We overheard them: they were revelling in the dream-lands of poesy, and our Eldest said tenderly, gazing upon the now lovely Josephine, 'Poor thing, 'twere pity to bring her back to earth again.'

Mr Arthur had many opportunities after this of reading the Sedleys, and we believed he had succeeded in doing so most thoroughly; but whatever was the result of his observations, with his usual prudence, they remained undivulged. We had suspicions, indeed, that he had dropped hints to our sister Mary, for she often looked sadly at Mrs Sedley, the tears coming into her eyes, while her manner towards Mr Sedley was more distant than formerly. 'Honest soul! she never gave the cordial hand or friendly greeting but as they came truthfully from her heart. Much we marvelled that Mary attempted no intimacy with Mrs Sedley, seldom went to Elder-trees; but whenever she met that lady, which was indeed but rarely, we remarked a loving cordiality in her mode of address which few persons elicited. She could not help showing what she felt, and Mr Sedley became stiff and distant proportionably. Was conscience whispering a rebuke, or did he feel himself misjudged?'

Well, time rolled on; changes came with time, and when some of us married, and left the village of S—, we forgot all about Mr Arthur, the Sedleys, and village gossip in general. I had been abroad with my husband for many years, and the first Christmas after our return to England was passed at the old-fashioned hospitable mansion presided over by my husband's mother. She was an octogenarian, but a lively, charming old lady. There were other guests expected, and amongst the rest, we were told a Colonel and Mrs Devereux were coming, of whom my mother-in-law spoke in raptures. 'They were so gifted, so gay and delightful, so fond of each other; the bloom of their love quite refreshing to witness—their story was so romantic too.' Thus the lively ancient ran on, exciting our curiosity to the utmost, but refusing to gratify it until we had become acquainted with the 'charming pair.'

Could it be possible?—did not my eyes deceive me? or did I, indeed, behold in Mrs Colonel Devereux the cidevant Mrs Sedley of Elder-trees?—Mrs Sedley as I had seen her on the 'happy evening' in our cheerful home at S—, far more radiant and beautiful than then; as young in appearance too, for happiness is an unailing renovator. She recognised me instantly, her colour changed, and her voice faltered; but as she turned towards her husband, whispering a few words in his ear, I read by the glance that passed between them a history of perfect sympathy and wedded happiness. We spoke of Mr Arthur; he had not been long dead; and I learnt that he had been Colonel Devereux's guardian and dearest friend. When I heard the singular episodes of Josephine's past life, I ceased to wonder at the almost mysterious veneration she cherished towards his memory. It gladdened the heart of our Eldest when the following particulars were duly transmitted to her, for the best of us like to find we have not erred in our judgments:—

Mr Sedley met with an accident shortly after we left S—, which brought on a lingering complaint, ultimately causing his death. During the two years he lingered between the confines of time and eternity, Mrs Sedley was an unremitting and devoted nurse, never quitting her husband's sick couch, and being nearly worn to a shadow when death at length released the sufferer. Mr Sedley's death brought also a release from suffering to her; for it is more than probable had she not been blest with an excellent constitution, the one drop of water which had for years been falling on her head, would have penetrated the brain, and wrought ruin to the delicate fabric of humanity. Mr

Sedley left the whole of his property to his wife; it amounted to about £400 a year, but hampered with the proviso, that in the event of her contracting a second marriage, she was to forfeit all claim to it, unless the aspirant to her hand possessed an income to the same amount, subject to no contingencies or casualties, such as business or speculation might engender. He also placed a small casket in Mrs Sedley's hands, exacting from her a solemn promise that in the event of her accepting an offer of marriage after his decease, whether forfeiting her income or not, she would deliver the said casket into the custody of her intended husband, charging him to examine the contents immediately, to examine them alone, and to receive them as a legacy bequeathed by the dead, for her sake and his.

Mrs Sedley gave the required promise, and accepted the trust: her sensitive, tender heart shrank from refusing a dying man's last request; but there was a look in his eyes when the vow was spoken which made her heart sink within her. What could that casket contain? Ah, it will never be opened! thought Mrs Sedley, for I have had enough of matrimony; and who would think of a crushed and faded flower when spring-buds are opening in glory all around.

Her first marriage had been to please her parents: within three years after Mr Sedley's decease she met Captain Devereux, and now thought of marrying to please herself. His income was nearly double her own, hereditary landed property: he loved and wooed her; nor when she had whispered the final 'yes' was the remembrance of the casket forgotten. She loosened the key from a chain which hung around her neck, and gave it to Captain Devereux as he quitted her side with a curiosity to penetrate the secret almost equal to her own. He found nothing within save a letter, and it contained but few words: it was as a voice from the grave, long confined within those iron bands, but bursting forth at length to light, in hollow murmurs of dim import. The dead addressed the living: the purport was to rescue a brother man from irremediable misery, in a solemn warning to abstain from wedding Josephine Sedley, whose specious arts would be all exerted to appear in a fair light: 'but beware of her; turn away and flee ere it be too late, and your doom sealed for life.' Thus it concluded. The handwriting was that of the late Mr Sedley, and it bore his well-known signature.

Incredible in fiction would these particulars appear, but we are dealing with facts, and painting men and women as they really acted and felt. Captain Devereux was excessively shocked and startled as he perused and reperused the extraordinary missive. Josephine had studiously avoided speaking of her first husband or her former life, and seemed fluttered and pained by any reference to that topic; her health was still variable, and she often betrayed an uneasy restlessness of manner, which might indeed be attributed to many causes. Captain Devereux regarded it as an evidence of a sensitive disposition, too prone to dwell on early sorrows or disappointments, for he could not look on Josephine without feeling the conviction that she had known suffering. He did not hesitate on the course to pursue, but laid her deceased husband's letter before Mrs Sedley, watching her intently as she read it. Her countenance changed not, but tears coursed down her pale cheeks as she merely exclaimed, 'It is cruel thus to persecute me from the grave! but oh, Edward,' turning to Devereux, 'you do not believe this?' Her eyes beamed with love and truthfulness, and his suspicions, if he had momentarily indulged any, were disowned at once; but Josephine's wounded heart had noted the transient shadow, intangible to all but her, and she sank down weeping bitterly, burying her face in her hands. No persuasions could induce her to divulge aught connected with her past history save the general outlines of family and fortune. She always gave one answer: 'A wife's lips ought to be inviolably sealed during life, and death may not dissolve the spell.'

A sad change crept over the young widow from this time; her cheek became paler and paler, and like one quite weary and exhausted with the struggle of life: even her lover had not power to rouse the bruised spirit. That fatal letter had cast a blight over her from the grave; and she at length summoned up resolution to tell Captain Devereux that their engagement must end: she had no power to disprove the cruel statement so fearfully made.

'Your whole future life, my Josephine, will disprove it,' he exclaimed. But her morbid sensitiveness would in all probability have caused her to shrink from ever becoming his wife, had not Mr Arthur providentially made his appearance at this juncture, and set all things to rights. The worthy old gentleman had been absent on a foreign tour, and great was his delight when he found that his young friend's future bride was the Mrs Sedley in whom he had been so deeply interested when at S—. He heard the story of the casket from Captain Devereux, its effect on Josephine, her refusal to exculpate herself by casting blame on the departed; and Mr Arthur's blue eyes sparkled as he rubbed his hands exultingly, saying, 'Right again, my boy—right again. I am never wrong in my judgments—never shall be. She is a noble creature, though perhaps a little too over-refined and fastidious, if that be possible. I read both her and her deceased tyrant—yes, you may start, for tyrant he was, and of the kind that breaks a woman's heart in the dreariest manner—under a show of kindness! Talents, hopes, health, all buried beneath his overwhelming selfishness and egotism, for I made myself acquainted with their private history. My heart bled for the poor young creature; but I said to myself, "None can save her: her doom is fixed: death is her only release;" and death, you see, did release her.'

'But did Mr Sedley positively ill-use his wife, my dear sir—surely he would not have dared to do that?' questioned Captain Devereux with flashing eyes.

'Well, he didn't beat her certainly; but mark me, Devereux, he was *jealous*—jealous as a man, jealous as an inferior—for he knew her superiority of mind to his own, and he quailed beneath that knowledge, and brushed her down. He was old enough to be her father, and he married her as a child; but the child became a woman, and his jealous love might almost have been termed hate; for it was not only those of his own sex on whom he looked with suspicion when they approached his wife, but women shared the same fate, and he grudged her a female friend. They had no children, and poor Josephine endeavoured to supply the void by dumb pets, on whom she lavished perhaps too much attention. Mr Sedley destroyed these more than once: the very books she read he disliked; and he was never satisfied unless she was darning his stockings, mending or making, or assisting in culinary preparations for his gratification! Women, he said, were fit for nothing else. He hated fine ladies; and he ought by rights to have married his cook. He had no pride in her beauty or talents. He was a handsome man, wished to be thought a clever one; and so he domineered over his wife, who had not spirit or power to check or stem the torrent of violence, which for long intervals slumbered, and oozed forth drop by drop on the victim's devoted head. He left her material, but endeavoured to wrest from her all spiritual comfort, for he knew the effect such a letter would have on her tender mind. In my opinion, Sedley ought to have been placed in a lunatic asylum; and if he had not been taken off as he was, I have no doubt he would soon have killed Josephine. Few women would have endured ten years of jealous madness as she did, so heroically and silently withal. I'll be answerable for her future conduct, Devereux,' continued Mr Arthur smiling; 'and now fix the day for the wedding; and tell her all I have told you.' Presently he added in a more serious tone, 'Tend the flower: place it in your bosom: though faded, it will revive with warmth and care, and repay you a thousandfold with its rich perfume.'

Mr Arthur lived long enough to watch the expanding blossom in all its summer beauty, and to rejoice that he had been made the instrument of saving one, so gentle and good as Josephine, from despair.

'Ah,' said our Eldest when she heard the tale, 'I am so glad I thought of asking the Sedleys to dinner.'

OCCASIONAL NOTES.

CHLOROFORM.

THE following letter appears in the 'Manchester Examiner and Times' of June 22:—'Sir—May I take the liberty of inquiring, through the medium of your columns, whether any, and what medical gentleman or dentist in Manchester, uses chloroform in surgical operations? Has it been introduced into any hospital here? There have been accounts of its use having occasioned death in London, and I am informed that great prejudice exists in this town against it. In Chambers's Journal for May last (page 280) there is a method of *testing* and *purifying* chloroform given; and I understand that the cause of death in the London cases arose either from impurity of the chloroform or the unskilfulness of the medical practitioner. I should also much like to know whether the mode of purification mentioned in Chambers's Journal is adopted in Manchester, and whether chloroform has caused death in any case here. It seems to me that if a medical man in this town would devote his attention to the subject, and procure pure chloroform, he would get well rewarded for his pains, and it would be a great boon to the inhabitants. —Yours very obediently, J.'

This letter is very reasonable. Chloroform of any kind is as yet little used in Manchester. The 'profession' there seems not prompt in making advances or adopting novelties, and they have not yet become generally aware, or at least not generally convinced, that chloroform of a pure quality, used with due care, is a safe application. As throughout England generally, there was first a wretched kind of chloroform used, which was seen to be dangerous, and then it was assumed that chloroform was a pernicious article, which it was the duty of cautious surgeons to avoid. The lucid explanations given by Professor Gregory before the Royal Society of Edinburgh, which we lately reported (No. 331), have not yet produced their proper effect in the south.

Men remark with wonder the great improvements of our day, by which personal locomotion and the transmission of intelligence are so immensely facilitated. There was a striking proof of this given on a melancholy occasion very lately, when the death of Sir Robert Peel, which took place near midnight, was promulgated in the papers published next morning in Edinburgh, exactly as in those of London. The rail and the electric telegraph perform wonders in some departments of our social state; but they seem to be useless in others. Here is a city full of medical men of high character, amongst whom a medicament most important to humanity takes its rise, and comes into general use. It has been for upwards of two years extensively and most successfully employed, in all kinds of cases, from tooth-drawing upwards. Thousands of people have taken it by way of experiment—nay, for amusement! In all, it is estimated to have been applied in this city upwards of eighty thousand times, and that *without the occurrence of a single accident!* One would think that such a fact would in these days soon be generally known. It lies open, palpable, before the whole world. Yet, strange to say, chloroform is little more than barely known in another British city, little more than 200 miles off, full of the most active, intelligent population in the world. It is throughout England the subject of a prejudice which a knowledge of the actual facts would at once dispel. Does not this show that the improvements are only in the physical machinery; and that when we come to the intellectual or moral, things are found as rusty as ever?

The plain truth regarding chloroform is, that in one city, where it is used pure, and with care, it is extensively and most beneficially employed. In other parts of the empire, where it has been made impure, and administered in an improper manner, it has been detrimental. In these other places, a pure article would of course have the usual good effects; but against this result there is an obstruction in the difficulty of transmitting an important truth from one mind to another. The only hope for the unfortunate public in this case is, to refuse to submit to a surgical operation until the attending practitioner has provided himself with the proper article entitled to the name of chloroform, and accomplished himself in the art of using it.

THE 'CANNY' SCOTCH.

In a late parliamentary debate, when a particular speaker opposed the claims of certain persons in Greece claiming compensation for alleged injuries from the government, it was deemed sufficient presumption against one that he was a Scotsman—'a canny Scotsman'—this implying that he must necessarily be seeking to cheat and overreach, and that the claim therefore ought to be disallowed. This seems to us an unjust imputation, and one which, as calculated to be offensive to a whole nation, it is unwise in a British legislator to give vent to. It is not uncommon, however, in public proceedings in England, to accept some allusion of this nature to Scotland as an exceedingly good joke. To a Scotsman who, besides his home experiences, has some personal knowledge of London and of English modes of doing business generally, the joke has a very strange aspect. He feels that, at home, he is living among a people who, under all drawbacks on account of whisky (grievous as these are), are still in the main a moral—yea more, a *simple* people. He seldom finds occasion to be watchful or suspicious in his dealings with strangers of his own country. Swindling, pocket-picking, and house-robbery, are offences so rare, that he scarcely has to be at all on his guard against them. The charities of life are conspicuous everywhere in the land, unblighted by mutual fears. In London, on the contrary, he finds a predominant and ceaseless apprehension of danger from rogues. In his lodgings, walking the street, hiring a cab, making a purchase in a shop, he finds himself purely an object of spoliation, his best hope being, that he will get off without more than an average amount of sacrifice. He finds every one expressing more or less in his ordinary demeanour that he is on the defensive against his fellow-creatures. To live un plundered, and not continually overreached, it seems to be necessary to have an immense amount of special local knowledge, without which the stranger must of course suffer. It is not many years since a London periodical work gave a series of papers exposing the false pretensions of almost every class of traders, and showing that in whole streets there was not a single window which did not tell lies for the purpose of imposing on the unwary! When the honest, simple-hearted Scotsman, after a day's experience of the almost universal cheating, overreaching, and imposture of the great Babylon, retires to his lodging, and reads an account of a public meeting of Englishmen who have been thrown into 'convulsions of laughter' by some waggish allusion to 'a canny Scotsman'—perhaps merely seeking his own from some very uncanny somebody else*—he is apt to feel that he has learned something like a new version of the fable of the wolf and the lamb.

It is to be feared that large portions of the people of England continue to labour under old traditional prejudices against the Scotch, which, taking their rise in an age of mutual hostility and exasperation, were not

over-true at the beginning, and have long ceased to be true at all. A little reflection might show that keen or smart dealing in trade is, upon the whole, less likely to characterise a people in the stage of civilisation at which the Scotch have arrived, than one in the position of the English themselves. If England, moreover, were to reflect on the immense aggressions she has made upon the world during the last hundred years, in the subjugation of India, and the establishment of colonies, she would come to think less of the adventurous spirit of the individual Scotch. This is a subject on which great misapprehensions are entertained. In sheltering 38,000 natives of England within her borders (as appeared from the last census), almost all of them mercantile men, many of them very prosperous, Scotland is obviously, in proportion to her capabilities, more hospitable to England than is England to her, since the number of natives of Scotland received into that comparatively large and populous country is only 103,000. In Scotland, besides, the English manufacturers of all grades do an immense amount of business by means of men who do not settle in the population—namely, the class called commercial travellers. Settled or peripatetic, English traders meet with all possible encouragement, and certainly with nothing like a spirit of national antipathy, or rancour, or sarcasm, in Scotland. It does not appear to comport very well with English magnanimity, that a contrary feeling should so often find expression in England.

Scotland has for many years given no sort of trouble to the central government. It is an industrious, and therefore a prosperous country, and hence there is little tendency to discontent on political matters. But there is a pretty prevalent notion in Scotland that her reasonableness, or tameness, or whatever it may be called, leads to her being somewhat slighted or overlooked by those intrusted with the conduct of imperial affairs. It is remarked that large grants are made from the state funds for London and Dublin, in comparison with any extended to Edinburgh, and that it is almost impossible, except under very special circumstances, to obtain an imperial support for any of the public institutions in the north. For example, while sixty thousand a year is spent on the British Museum, nothing whatever can be obtained for any kind of museum in Edinburgh, although it is obvious that a certain diffusion, as well as concentration, is desirable for such institutions. The discontent on these subjects is not loud, but it is deep, and always getting deeper. It will be enough to add only a couplet from Burns—

'For God's sake, sirs, then speak her fair,
And stralk her canny wi' the hair.'

THE BUCCANEER.

In this country the supremacy of physical force is at least theoretically at an end. National wars are denounced as impolitic and unnecessary, as well as cruel and impious; personal conflicts among the lower classes excite only contempt and disgust; and when a gentleman is called to the arbitrament of the duello, he turns his back upon the inviter, telling him significantly that he pays his police rates. Under such circumstances, how is it that we read 'Ivanhoe,' and other romances of chivalry, with undiminished delight, and that we retain all our old interest in the perils and achievements of mere animal courage? The reason is probably to be found in our instinctive recognition of the progressive development of the race to which we belong. There have been times, and there are still countries, where physical strength and iron nerves occupy the place of moral virtue, and where the capacity to give and endure hard blows are the test of real greatness. Each stage of social development has its own heroism; and knowing this—or rather *feeling* it—we may read with interest, and perhaps admiration, the details of deeds which in our day would consign their authors to the hulks or the gallows.

* The word 'canny' is generally used in Scotland in the sense of gentle, calculated for good. In England, apparently in some confusion from its resemblance in sound to 'cunning,' it is usually accepted as meaning sly and knavish. Jamieson gives both senses; but the latter is apparently obsolete in Scotland.

The author of a work before us*—which can hardly be termed a work of fiction—is aware of the principle here hinted at; and he strives from the commencement to impress upon his readers the fact, that the Buccaneers of whom he treats were not pirates in our sense of the term, embarrassing commerce, and distracting the onward course of civilisation, for their own personal gains, but men called up by the exigencies of events, and belonging essentially even in their crimes to the epoch. Spain asserted an exclusive property in the new world, and vessels of other nations presuming to show themselves in the Carribean Sea were treated like poachers on a private manor. This unheard-of arrogance gave rise to a coalition against the Spaniards, which subsisted in these latitudes even when the different nations at home were at peace with each other. Spain was the only enemy, and with her there was never 'peace beyond the line;' the other Europeans, in public avowal of their confederation, calling themselves the 'Brethren of the Coast.' The Spaniards, who considered their right to the new world as indefeasible, inasmuch as it was derived from the pope, looked of course upon these interlopers as pirates; but the Buccaneers themselves assumed the name of privateersmen, and frequently carried letters of marque issued by any European nation with which Spain was at war.

So much for the theory; but the practice, as Mr Reach admits unwillingly, was a very different matter. The European ships which asserted their right to trade in these seas were necessarily at war with the Spaniards; but trade was soon forgotten in the excitement and profit of the strife; the desperate and depraved rushed in crowds to the bloody field; and a war of plunder ensued waged by roving banditti. Thus the Buccaneers—for we must not spare our author's tenderness—although theoretically privateersmen, were practically pirates; and, taking them as a body, they were perhaps the most atrocious miscreants in the world. Still, it cannot be denied that there mingled with the offscourings of the English, French, and Dutch jails some few adventurers of a better class, who would have shrunk from mending their fortunes by taking to the road—as well as many waifs and strays of the ocean, who were driven into the ranks of the Brethren by the storms of fortune. Among these classes, therefore, Mr Reach seeks his hero; and without throwing any permanent disguise over the repulsive features of the trade, he brings his story within the range of modern sympathies by clothing his Buccaneer in the conventional honesty and simple-mindedness of a seaman.

Leonard Lindsay, for that was his name, while on a voyage to Italy as a sailor, was blown into the sea in a squall with a portion of the mast and yard on which he had been employed in securing the topsails. Sustained by a spar, he spends the night in the stormy water, suffering a score of deaths; but in the morning he is rescued by the pinnacle of a Mediterranean felucca, bound for Hispaniola. There he soon learned that it was the intention of his preservers to sell him for a slave (nominally an apprentice) to the French West India Company. By the connivance of a countryman on board, however, he makes his escape, and once more finds himself floating alone on the sea, but this time in a small skiff, and on the coast of Porto Rico. 'For nearly an hour I remained almost motionless, fearing every moment to hear an alarum-gun fire; but the night continued silent, and then with a good heart I took up my oars, and using two as sculls, rowed towards the coast. The land-breeze blew steadily, so I had to tug long and hard. At last, seeing the dusky bank close ahead, I paused to look for a landingplace, but none could I see. The nature of the coast seemed to have changed, the land hereabout being a long, smooth wall of perpendicular rock, sinking sheerly into

the sea, which rose and fell at the base, with a loud hissing, pouring, gurgling sound—not like the deep thunder of surf. I therefore set myself to pull eastwardly in search of a creek or bay. I knew that the moon would presently rise over the land, and in sooth, in about an hour, I noted the glow of her broad disk, peeping over the edge of the cliff ahead of me, and showing it, fringed, as it were, with a line of bushes and brushwood, which curled over the precipice, surmounted now and then by one of the tall, bending palmetto-trees. In about an hour I had moonlight sufficient to see pretty distinctly the great limestone ledges along which I was cautiously coasting—pausing on my oars, now and then, to hear the great buzz of insects and the forlorn cries of night-birds which floated from the land. It must have been near three o'clock, when I saw a black-like opening in the wall of cliff, and very cautiously I pulled my boat inwards. For some time I was in great doubt as to whether I had found a creek, but presently I beheld the two portals of rock between which I was, fairly astern of the boat, and saw and heard the white gleam of the surf breaking on the beach. But the former was too high for me to risk a landing, and I would have pulled out to sea again, but seeing another dark shadowy space upon the left, I made for it, hoping it might turn out an oblique channel leading from the main cove. I was not deceived, and presently the boat glided along a sort of dusky canal, with great rocks on either hand, clothed with rich creeping herbage: trees hanging over either ledge, and as the channel narrowed, meeting, and by their intertwining boughs shutting out the blue sky. Below me the water showed as black as tar, yet sparkling when the undulations from the outer creek caused it to rise and sink upon the bushy banks. Now and then a flutter of wings would echo in the narrow passage, and the loud shriek of a night-bird would drown the noise. Anon a scrambling, wallopping sound, followed by a splash, as of a great animal scuttling from a ledge into the water, would ensue, and again for a time there would be deep silence. In about a quarter of an hour the heave of the sea was no longer felt, owing, as I concluded, to the shallowing of the creek; and then making fast the skiff to a great protruding branch, which I struck my head against, I rolled myself in a blanket which I found Wright had flung into the boat, and was soon asleep, being thus, as it were, safely anchored to the new world.'

The above extract is a fair specimen of our author's style and manner; and the reader will perceive from it, that in perusing the book he will be in the hands of one who exercises no small power over the imagination. If we had room, we should like to quote likewise the legend of 'Foul-weather Don,' which reminds us a good deal of Washington Irving. The ship was some days out of sight of land, when the Don makes his appearance in an old-fashioned boat. He is himself, too, old-fashioned—looking quite as old as his boat; dressed in a high conical hat and feather, with slashed and brocaded doublet, stiff ruff, red stockings, and with great bunches of ribbon in his shoes. It may be supposed that the sailors stared at their strange visitor; but one of them flung him a rope, and the stranger mounted on deck. Foul-weather Don proves to be the spectre of a tyrannical Spanish captain, whose memory had been so far impaired by the consequences of a fire, that he could not recollect where the island was on which he had hidden his treasure. He swore, however, never to return to Old Spain without it, and for a hundred years had continued to sail the ocean in quest of his gold. This is altogether a very good preternatural story, but we can only give its conclusion. The sailor who threw the rope to the old sinner has discovered the gold on a desert island, but is near getting his throat cut by the turtlers in whose boat he is carrying it off. 'The weather getting very thick, the men forming each group began to whisper, and then all at once, as if they had made up their minds, they gave a loud shout, and made a rush at the box; as they did so, they drew knives and

* Leonard Lindsay; or the Story of a Buccaneer. By Angus I. Reach. 2 vols. London: Bogue. 1856.

snicker-sneezes, and cut and chopped at each other, struggling and cursing over the chest. Ned saw the blood splash down on the gold, and he rushed forward to separate them, crying out—"Madmen that you are—look out for the squall first, and fight afterwards." But it was too late, mates. The sky got black, and with a loud roar the squall came, tearing up the sea before it, and in the very centre of the flying foam Ned swore he saw Foul-weather Don, with his arms stretched forth, as if in triumph. In an instant the blast struck the sails, heaving the turtler bodily on her broadside, and as she lurched over, the heavy box of gold fetched away with a mighty surge, and went crashing through and through the frail bulwark, and then with a great plunge down to the bottom of the ocean, there to lie, mates, even until the day when the sea shall give up its dead! All this passed in a moment, and the next instant the ship, as though relieved by having cast forth the guilty gold, righted with a heavy roll, which sent the seamen sprawling across the deck, with their knives in their hands, and bloody gashes in their faces and limbs. The sailor looking down into the sea where the gold had sunk, sees the old captain's boat, keel uppermost.

An adventure as strange, though unconnected with the supernatural, is that of the 'Dwarf Pilot of the Unknown Shoals.' The ship on board of which Lindsay is, now one of the Buccaneers, finds herself suddenly in the midst of breakers when the crew knew of no land nearer than 300 miles. It was an immense and unknown shoal, where a flaw of wind, or a shift in the currents traversing its intricate channels, would be instantly fatal. 'At length the dawn grew pale in the sky, then a red, warm glow brightened above the waves; the thin night-mists rolled away; the seabirds came shrieking and clanging from their nests and holes, and we truly saw a lonely and desolate sight. All around the schooner for miles and miles was a pale-greenish sea, laced, as it were, with bars and streaks of surf, which spread around like open network, and dotted here and there with great smooth banks of bright sand; and low, long reefs like jagged walls rising now and then into a higher point of precipitous rock, which showed perhaps some eight or ten feet above the level of the surf. The blue sea formed the framing of this dismal picture.' They had got, by a kind of miracle, into the very middle of this hopeless range of shoals, banks, and reefs; and to get out, without a miracle, seemed impossible. The day was passed in vain explorations, and they determined on the following morning to begin a new search for an outlet in both the ships' boats. 'About an hour before sunset the men were lounging under the awning which we had set, fore and aft, some of them fishing in the clear water beneath us, when on a sudden there was a great cry of astonishment raised; and looking up from the chart which I was studying, I saw a strange little man, so small, he might almost be called a dwarf, deliberately climbing over the taffrail. A dozen of our seamen rushed to lay hold of him, but he waved his hand, as though there was no necessity for violence, and jumped lightly down on deck. "Where is the captain of this ship?" quoth he in a strange shrill, cracked voice, and speaking English with a slight foreign accent. At this moment Captain Jem came out of the main cabin, and stared heartily, as indeed we all did, to see so unexpected and strange-looking a visitor. The creature—who was so queer and dwarfish a man, that as I gazed upon him I thought of old-world stories of Brownies and uncanny men of the moors—could not have been above four feet high. He had very broad shoulders, and such long muscular arms, that they looked like fore-legs of an ape. His face was big and broad, but not by any means ugly. He had light-blue twinkling eyes and long fair hair, and a beard of a flaxen colour. The little man's dress was as strange as himself. He wore a broad hat, made of great ribbons of strong green sea-weed, very neatly plaited and wrought. He had a linen shirt, not of the cleanest, with a cloth cloak hanging round his

loins, and bound with a broad belt of similar sea-weed to that which formed his hat; while on his legs, which were very short and thick, he wore a pair of coarse canvas drawers. His great brown splay feet were bare. When I say that this strange-looking apparition had a sort of necklace of coral, mixed with small pieces of gold and silver money hung round his neck, that his ears were weighed down with big silver rings, and that in his hand he carried a paddle, with a broad blade at each end, I have fully described to the reader the stranger, who now advanced towards Captain Jem, pulling off his hat, and making a very polite bow. Not to be behind-hand in good-breeding, Stout Jem was nothing loth to return the salaam; after which he asked the little man how he had come on board.

The dwarf had arrived in a beautiful canoe, which was now seen alongside; and in reply to the questions of the captain, he announced himself to be a pilot. To what land? None nearer than 100 leagues. What ships, then, come hither to demand your assistance? None at all. The mystery thickened, and the crew stared at each other. The dwarf continued—"There never was a ship," quoth he, "which came to these shoals but stayed there. There be plenty of room for a navy to lie on these sands and reefs; and then the first gale of wind that comes smashes them faster than e'er a ship-breaker in Limehouse." Here the captain got into a rage, and threatened his visitor with the yard-arm. The dwarf, however, remains cool; and in reply to all the captain's questions as to his trade and his whereabouts, replies merely that if they chose he would pilot them out to sea, and ask nothing for his trouble but the pleasure of getting rid of them.

"What will you do when we get to sea?" asked Bristol Tom.

"What is that to you, old man?" quoth the dwarf: "go your ways, and leave me to go mine. I warrant I should have had more wit than to come blundering in here against my will."

"So you landed here on purpose?" says I.

"Whether I did or no," says the dwarf, "is nothing to you. Do you want a pilot, or do you not?"

The sailors, instead of accepting his offer upon his own terms, endeavour to seize the dwarf; but he bounds over the side, and in an instant his light canoe is floating a couple of fathoms from the side. Then follows a chase in one of the ship's boats, described with great spirit; but the little man baffles his pursuers with perfect ease, and they return, forming a shrewd suspicion that the shoal is haunted.

The dwarf turns out to be one of the treasure-seekers of those days, and he meets with a tragical end, which is the worst part of the story.

To give any connected account of the hero's adventures would be impossible in the space to which we are confined. In fact the whole book is full of adventures, and of the most exciting kind imaginable; and the author seems to be as much at home on the land as on the sea. The escape of Lindsay, when hunted with bloodhounds, is a capital piece of melodrama; and generally the scene-painting is highly effective. The Buccaneers' life is at first described a little too much *en beau*, but at the conclusion this is amply made up for. Before coming, however, to the closing scene, we must mention the regulations of the Buccaneers, which are given from actual history. The principle of the voyage was, 'No prey, no pay.' The booty taken was thrown into a common fund, out of which all on board were paid, in due proportions, after the share of the owners was set apart. Then the salaries of the captain, the quarter-master, the boatswain, the carpenter, and the surgeon, were fixed, and certain sums were determined upon, to be given in compensation for the different species of wounds which we might receive. These compensations were upon the following scale, and they applied alike to all the ship's company:—The loss of a right arm, six hundred pieces of eight, or six slaves; of a left arm, five hundred pieces, or five

slaves; for a right leg the same; for a left leg, four hundred pieces of eight, or four slaves; for an eye, one hundred pieces of eight, or one slave; and for a finger, the like sum. As for the proportion of pay, the captain had as much as five ordinary seamen; and the quarter-master, or master's mate, which was my station, that of two. The rest of the crew shared equally, and two boys whom we had on board drew the pay of one able-bodied man. Furthermore, it was stipulated that each mariner, without any distinction of rank, should be daily entitled to two full meals of the ship's stores, besides what game or fresh meat we might fall in with; and the indenture concluded by reciting that all those who signed it by name or mark, did thereby take a solemn oath not to hide or conceal from their comrades the slightest article of value which they might become possessed of, but to fling all, without let or drawback, into the common fund.

These are doubtless good regulations; but the tyranny of the officers, lawlessness of the men, and hideous depravity of the great majority of the crew of all ranks, made the ship not unfrequently a pandemonium. The scene described as taking place on board of one of the vessels, is a picture of savage drunkenness ending in literal madness. The mate smashes some bottles of brandy into a tub, and then sets fire to the whole, the besotted company only shouting and cheering at the feat. But the tub is overturned in their frantic struggles, and a flood of liquid fire surges over the cabin.

"Oh, then, the oaths, the yells, the frantic strugglings, which filled that hell upon the waters! Dozens of bottles had been already broken or spilt, and their contents, surging about, had thoroughly drenched the clothes of the wallowing brutes, who lay sprawling upon the floor. The cabin was in a moment one blaze of flame, in which men with their clothes and hair a-fire, and their faces livid and ghastly in the glare, leaped, and staggered, and sought to clamber on barrels and casks, blaspheming, and screaming, and scuffling madly with each other.

"Up, up!" shouted Rumbold; "up for dear life!" All that I have described took place almost in the time that one sees a flash of lightning. In a moment, without knowing how I had done it, I was upon the deck, with my clothes and hair singed, but otherwise unscathed. As I drew in the first blessed breath of the fresh cool night, a loud explosion shook the deck under our feet, and we heard the tinkling crash of the cabin windows as the glass was blown out of them.

"There went a powder-flask!" cried Rumbold; and then, as if the word appalled him, he staggered back from me, crying, "The magazine—the magazine!—it is just beneath the floor of the cabin!"

"What I did for the next moment I hardly know. It is only a vision of rushing to the davits where a quarter-boat hung—of the rope flying hot through my hand—of Rumbold searching frantically for oars on the deck, while a blue flame streamed up through the skylight and cabin stairs, and the shrieks of the burning men mingled in the roar of the fierce fire!

"But in that vision I had one awful glimpse down into the cabin. May I be enabled to forget what I saw! The masses of fat meat, the dry bedding, the clothes scattered on the floor, masses of them being drenched with spirits, were all flaming together, while the drunkards rolled, roaring and scuffling, on the table and the floor, their flesh actually scorching from the bones! I say no more on't: would I could think no more on't.

"Over the side went we with a single leap down into the surging boat. "Off, off—push off!" And as the pinnace glanced away from the ship, tongues of flame curled and roared out of the cabin windows all round the stern. "Pull for life!" We stretched to the oars like madmen, and the boat flew over the water. The mizen-sail, which was as dry as dust, for there was no dew, caught fire from the blaze, roaring up from the

skylight; and in a minute the scorching element ran all aloft, blazing along the ropes, licking up the broad sails, making the strong canvas tinder, and lighting up for miles and miles the lone midnight sea! There! A bright sheet of red fire shot forth, as if a volcano had burst out under the ocean, the glare showing us for an instant, and no more, a vision of huge beams, and rent masses of timber, flying out and upwards; and then—just as we heard the sound of the explosion, not a loud sharp crack, but a smothered roar, which made all the air shake palpably around us—down with a stately swoop fell the flaming mizen-mast into the sea!

"We sat in speechless horror, unable to move our oars; then all the fire, low and aloft, disappeared with a loud hiss, and a great white cloud of steam rose boiling from the wreck, loud sounds of cracking and rending timber coming forth from the vapour, mingled with the gurgling rush of water pouring into and sucking down the shattered ship. After this, the white smoke rose and floated, like a canopy, all above our heads, and we gazed, and gazed, but saw nothing on the midnight sea.

"They are gone—it is all over," said Rumbold. "Lord have mercy on their sinful souls!"

"To this I solemnly responded, with my heart as with my tongue, "Amen! amen!"

NOTES ON EMIGRATION.

CANTERBURY SETTLEMENT.

SOME time ago we noticed the establishment of a colony at Otago, in New Zealand, by a body of individuals belonging to the Free Church of Scotland, and from all recent accounts, it appears that this attempt at systematic colonisation is likely to be crowned with perfect success. Perhaps encouraged by the example of the Otago settlers, and at all events moved by considerations of the importance of colonising on an enlarged social scale, certain persons have formed themselves into an association, with the view of establishing a Church of England settlement in New Zealand. The Canterbury Settlement, as this new colony is to be called, lies on the same side of the middle island of New Zealand as Otago, about 150 miles farther north, and consists of a million of acres of land. The land has been acquired by purchase from the New Zealand Company, which stands in the place of the crown as regards the disposal of waste lands. The association is entitled, by royal charter, to acquire and dispose of lands, and as a corporate body to make all proper arrangements for conducting a settlement.

As formerly stated, we do not give an unqualified approval to the planting of colonies on the basis of one predominant religious denomination; but in this, as in many other things, we must make a choice of evils, and adopt the lesser. Left to itself, emigration is conducted on no plan. Crowds of people in struggling circumstances ship themselves off anywhere, and anyhow; when they arrive in the country of their choice, they scatter themselves abroad in forests and wastes; buy land at a few shillings an acre; toil like slaves for years; and live probably hundreds of miles from churches or schools. They seldom fail to obtain plenty of food; their animal wants are fully supplied; but an intelligent man aims at something besides mere food and shelter. And yet the mass of emigrants get nothing else. The consequence of such undirected plans is a very slow social progress—often a protracted barbarism. What is wanted is a well-considered scheme of colonisation, by which emigrants of various classes—capitalists, professional men, tradesmen, agriculturists, labourers—might proceed with some degree of certainty to a quarter where they could unitedly set up a state of society resembling that with which they had been accustomed. Schemes of this kind have always been most successful when allied with religious principle. A community of faith has formed a bond of union among the first set-

tioners, and an attraction to those who came after them. Some of the old American colonies were eminently successful on this account. Maryland was settled by Roman Catholics, Pennsylvania by Quakers, New England by the Puritans. Ever since England lost these colonies, the practice of sectarian or concentrated emigration has been dropped, and the haphazard plan has been almost the only one followed. An energetic body of Scottish seceders, in planting Otago, may be said to have revived a lost art; and now an association of Englishmen propose to follow in the same course.

The Canterbury Association consists of a number of noblemen, private gentlemen, bishops, and archbishops, at the head of whom is the Archbishop of Canterbury. We observe that the Archbishop of Dublin, the Duke of Buccleuch, and Lord Ashley, are among the office-bearers of the association; and their names alone are a sufficient guarantee for any arrangements that may be adopted. The objects of the association are thus briefly stated:—'It is perceived that adequate provision for man's moral and religious wants in the new country contains the primary element of successful colonisation, not only on account of the importance of such provision *per se*, but also because thereby alone can a really valuable class of men be induced to join in the foundation and settlement of colonies. Upon this idea our plan is founded. We intend to form a settlement, to be composed entirely of members of our own church, accompanied by an adequate supply of clergy, with all the appliances requisite for carrying out her discipline and ordinances, and with full provision for extending them in proportion to the increase of population. As by preserving unity of religious creed, the difficulties which surround the question of education are avoided, we shall be enabled to provide amply and satisfactorily for that object. The committee of management will have the power of refusing to allow any person of whom they may disapprove to become an original purchaser of land; and as that power will be carefully exercised, it is hoped that ineligible colonists may be almost entirely excluded, and that the new community will have at least a fair start in a healthy moral atmosphere. The purchasers of land will have the selection of labourers to be recommended for a free passage; such labourers to be also exclusively *bonâ-fide* members of the English church. As a site for our projected colony, we have fixed upon New Zealand, which offers greater advantages of soil and climate, combined with a greater amount of available and unoccupied land, than any other British possession. . . . In order to provide funds for carrying out the objects of the association, every purchaser of land will be required to contribute a sum proportioned to the extent of his purchase, and all such contributions will be expended, through the instrumentality of the committee of management, according to the wishes and directions of the colonists, from among whom those who are fit and able to take part in the proceedings of the committee will be from time to time added to their number. The principal sources of expense will consist in religious and educational endowments, in the importation of labour, in surveys, and in those public works (such as roads, bridges, and buildings) which may be absolutely necessary to the establishment and maintenance of the settlement. These are things which every good colonist must wish to see well done; but they are such as the isolated efforts of individuals cannot do, and therefore it is necessary to make a contribution to them a preliminary requisite to the purchase of land in the settlement which will benefit by their existence. Ten shillings per acre will be charged for the rural land; and every purchaser of land will contribute to the purposes above-mentioned in the following proportion:—L.1 per acre to the religious and educational fund; L.1 per acre to the immigration fund; 10s. per acre to the fund for miscellaneous purposes, such as surveys, roads, bridges, &c. . . . Such are the main features of the plan; those who bring it before the public propose to themselves a high object, being nothing less than a reform

in our system of colonisation, which might almost appear to have been based on the assumption that colonists have no intellects to be cultivated, no souls to be saved; and that by emigrating they lose their right to the feelings and aspirations, the habits and institutions of Englishmen.' Those who are desirous of joining the colonists, or who wish for further information on the subject, should apply to the secretary, H. F. Alston, Esq., 41 Charing Cross, London.

With regard to the form of government:—'The colonists will sail from England as far as possible an organized society; and it is the intention of her Majesty's government to direct that the settlement of Canterbury may be, if no local obstacles or other unforeseen objections prevent, constituted a distinct province, with a separate legislature. If this intention be carried out, they will possess institutions of local self-government to an extent unexampled in the history of new colonies in modern times; and the enjoyment of this boon alone would suffice to stamp the Canterbury Settlement with a peculiar character, and to make it especially attractive in the eyes of all who are acquainted with the evils of the opposite system. Its colonists will possess complete powers of self-taxation, of legislation upon all matters which concern themselves alone, and of control over all functionaries engaged in local administration, without any interference on the part of other and differently-constituted communities; while it is hoped that the care exercised in selecting those colonists, and their general unity of opinion on topics which form a fertile source of discord at home, will enable them to exercise with peculiar advantage and facility the privileges with which it is hoped that they will be intrusted.'

Two-sixths of the price paid for land are to be set apart for ecclesiastical and educational purposes on a permanent footing. That so large a proportion of the price should be sunk in endowments of this class may appear excessive and inexpedient. But let it be remembered that the dispensation of funds on a liberal principle for churches and schools, is only another name for insuring the settlement of a respectable and 'gentlemanly' community; and if by that means persons of wealth, taste, and education can be induced to settle down together, will not the money be well spent? After having carefully perused the 'Papers' put forth by the Canterbury Association, we candidly avow that we see no reason for a fear sometimes entertained, that the colony will be a mere pendicle of the Church of England, and subordinate to its priesthood. As stated in one of the 'Papers':—'If the object were to extend the church by means of the colony, and all arrangements were planned with this aim in view, then, indeed, either Canterbury would be a priest-ridden settlement, or, as is more probable, the scheme would break down in the execution; but if, on the contrary, the ultimate object is a superior colony, the extension of the church being one of the means employed, in that case, execution being conformable to the design, there will be no spiritual domination in this settlement, but only such religious provisions as promise to make the colony attractive and prosperous.' Further on it is mentioned:—'As respects the attraction of religious provisions, the Canterbury enterprise already furnishes satisfactory proof in the first body of colonists now preparing to emigrate. We allude only to those of the gentry and capitalist classes; for whenever these abound as emigrants, the other classes are sure to be in abundance. We say then with confidence, that as respects numbers and wealth, the body of gentry and capitalists proceeding to Canterbury surpasses those who founded South Australia, Wellington, or Nelson, if it does not surpass all of them put together. Attribute what may be to the uniform fertility of the Canterbury Plains, to the absence of vexing natives, to the climate and scenery, to the full previous survey, and consequent freedom of choice in appropriating land, to the "great names" of the Canterbury Association, and to the pioneering of

such a man as John Robert Godley; award to each and all of these circumstances their just proportions of influence in attracting emigrants of the higher classes; and yet it will be found that the main attraction to Canterbury is the religious element of the plan. Nor has this attracted only the most religious class. By attracting them, it attracts others who see that capital will be most profitably invested in a settlement to which they are attracted in great numbers, and where their wealth, conduct, and example will conduce to a rapid and solid prosperity.

We shall watch with interest the progress of this remarkable settlement, and report to our readers any new circumstances that may seem worthy of being brought under their notice. One word only remains to be added. We are sorry that the term 'Canterbury' has been employed in naming the settlement. All repetitions of old-country names are bad, and this, from peculiar circumstances, is doubly so. It would be much better to seek out and adopt the native name of the district, as in the case of Otago.

LETTER FROM A PAUPER.

A PERSON, who gives us his name, and describes himself as a parish pauper, living in the neighbourhood of Aberdeen, writes complainingly to us of an indignity which we have lately committed towards the poor. The letter is so characteristic, that it deserves publicity. We improve only the orthography:—

'Permit me to call your attention to an article entitled "Neglected Children," in the number of your Journal for June 15, in which article paupers and pauper children are mixed up with crime and criminals of every description, as if, in fact, they were guilty of some crime, and ought to be treated as criminals. I should expect from you something more like truth and justice. But before I mention what I complain of, permit me to state some particulars of my life. To begin at the beginning: my father was a soldier, and accompanied Abercromby to the country of the Pyramids, where he experienced the ordinary honours of a soldier. A stray ball went through his leg; and while sitting on the ground in endeavouring to bind up his wound, a mounted warrior gave him a cut across the back of his cranium with a sabre, which greatly disfigured his appearance, and cured him of soldiering. He returned home; was discharged; and became a police-officer in Edinburgh. I was born in Leith Walk in 1819, and while still young, went with my mother to visit her aged father in the north country. Here we resided for nine years, and all the education I got was three-quarters of a year at school. When about nine years of age, my parents removed to Aberdeen. As soon as I arrived in the granite city, I was placed with a distant relative five miles from town, and here I rusticated two years herding cattle. From this I was taken home, and placed in a factory. I wrought at heckling flax for about six years, and then shifted to a cotton-work. My employment consisted in starching, or preparing the yarn with a kind of paste before it is put into the power-loom. Awfully hot work this was; so much so, that on entering the apartment we put off all our clothes except the shirt and a pair of loose trousers. Arms, neck, breast, and legs, were bare, and yet the perspiration was excessive. At this trying employment I continued two years, during which I lost a stone in weight. On leaving the cotton-factory, work was difficult to be had. I went to the country, and helped a relative to keep a toll. It being the depth of winter at this time, a very heavy fall of snow blocked up the road; and it being the duty of tollmen to keep the roads clear of drifts, I went to clear part of the way the day after my arrival. It was a dreadfully cold day; a piercing wind blew, accompanied by sleet and rain. However, I put off my coat, and commenced work, and wrought till I was both wet and weary. As might be expected, I caught a cold, or the cold caught

me. Be that as it may, I got it—and such a cold! I could not speak for three months, and did nothing but cough night and day. People said I had got consumption. They were mistaken, however: I got better. The cough left me, and I was left with an extraordinary shortness of breath. In this state I again obtained employment at the cotton-work; but I now found that if I exerted myself, or travelled a short distance, my breathing became difficult, accompanied with a quick and irregular beating of the heart. Unfortunately I disregarded these symptoms of disease, which I imagined would leave me by and by; and in 1843 I married. I, however, found that the disease was gradually getting worse; so that, in 1849, I was under the necessity of giving up work, and going to the infirmary. For about six months I used all sorts of medicines, both inwardly and outwardly, with blisters of every shape and size, without being in the least relieved. By this time my family, consisting of my wife and three children, were in a state of utter destitution. Some friends advised me to apply for parish relief. This was going against the grain. I endeavoured to find some employment that I was fit for; but my efforts were useless, and I was obliged to apply to the parish. My only alternative was starvation; and I really believe I chose the worst, as the parochial board has kindly allowed me, my wife, and three children, 10s. a month, or 2s. 6d. a week. You, sir, may believe that we will not get fat on that allowance. However, that is not what I complain of; but that my children should be taken to those Ragged Schools, as they are called, to be educated. I am perfectly satisfied that at these schools, where they would mix with criminals, they would learn more evil than good. Yet it is proposed to put all the pauper children into them. It is certainly very hard upon me that because I am unfortunately afflicted both in body and mind, my children should be mixed up with the sweepings of the streets, which would in all probability be hurtful to them during life. Excuse this rather long story, but I could not refrain from stating my objections,' &c.

We deny having implied in the article in question a non-distinction between paupers, simply as such, and criminals. A pauper may of course be a very virtuous person. Our correspondent, for instance, probably is so. His anxiety to keep his children clear of the criminal class argues as much; and we honour him for the feeling which dictates his letter. At the same time, what is society to do? Here is one man who, marrying imprudently when under a disabling ailment, throws himself with a burthen of helpless children on the community. There is another man, dissolute and heartless, who deserts his children, or deliberately allows them to grow up as savages on the streets. Another set of children, perverted by bad example, go about seeking for opportunities of committing crime. In all of these ways a large burthen of unprovided children falls upon the community, who must either take them in charge, or see them grow up as an army of fresh recruits to the criminal class. The question is, Is society to be expected to make nice distinctions amongst these children, furnishing them with separate lodging, schooling, &c.? Society's own answer, we rather think, will be, 'We cannot refine in that way.' The common sense of mankind has everywhere declared that a gift must not be critically scanned. It must therefore be for society to say how far it can go in arrangements for the succour of its outcast children, not for particular parents to claim this and that privilege and favour. We believe, however, that the arrangements are actually, in general, good, and that such complaints as the above are far from being well-founded.

The letter of our pauper correspondent reveals pretty clearly what is, we fear, the general feeling of that class regarding their relation to society. He brings poverty and disease upon himself, and entails the former on his children, without any self-reproach. He is succoured and medically treated at the expense of

his industrious fellow-creatures, without any gratitude. He thinks not of the hardship it is to society to support him and his family; he thinks only of the narrowness of its allowance, and criticises its various arrangements for his benefit. We remember being astounded in our youth by seeing a lame female beggar who had to be carried from door to door by the servants of those who gave her alms, thumping with a stout stick one of her bearers for not carrying her with sufficient steadiness: it was the type of the modern pauper.

SHETLAND WOOL.

The Shetland man wears nothing but the wool of his own sheep; stockings, shirt, drawers, thick Jersey cap, mittens, all are knitted by his family. His trousers are from the same wool, woven in a rude loom. But the wool is of further use in affording the means for the goodwife's indulgence in the luxury of tea. The quality of wool varies: the fleece of some of the sheep is coarse, of others exquisitely fine; so that from two sheep, belonging to the same hill-pasture, one pair of stockings may be made worth fourpence, and another pair worth two guineas; but its general character is a soft fine texture. Practice in the old-fashioned hand-spinning gives to some a beautiful certainty and regularity, competing with and surpassing the thread spun by the finest machinery. The Shetland woman knits from childhood: her ball of worsted and wires accompany her everywhere; into the fields, to be taken up at intervals of rest; even during hard work she plies her industrious fingers, for she may be met on the hill-side with a heavy burthen on her shoulders, bending beneath the weight, but still knitting. She knits, too, when she herself forms the burthen on the back of her little sheltie: his short step does not prevent her knitting. With such constant practice, need we be surprised that some arrive at such perfection in the art? For many years the Dutch were the chief customers for Shetland hosiery. Their fishing-vessels, from five hundred to a thousand, carrying fifteen men each, made Shetland their rendezvous in their yearly visits to the North Sea to prosecute the herring-fishery, and did a considerable barter trade, giving in exchange tea, tobacco, and other exciseable articles; the Board of Customs or Excise, however, deriving no benefit in the matter. But the knitted goods in demand were coarse and cheap, little calculated to improve the manufacture. As the number of Dutch boats dwindled, and with them the hosiery trade, a market was found in Scotland, and finer goods came into demand. The Scotch ladies, good knitters, could appreciate the work. It is only of late years that these goods have been more particularly introduced into England. Fortunately for the knitters, a notion gains ground that woollen clothing is more suited than any other for our variable climate; and the softness of the wool, and the pleasant elasticity that knitting gives, cause these goods yearly to increase in favour.—*Standon on the Shetland Islands.*

THE SECRET OF LONGEVITY.

The means known, so far, of promoting longevity have been usually concentrated in short pithy sayings, as, 'Keep your head cool, and your feet warm'—'Work much, and eat little,' &c. just as if the whole science of human life could be summed up and brought out in a few words, while its great principles were kept out of sight. One of the best of these sayings is given by an Italian in his 116th year, who, being asked the means of his living so long, replied with that improvisation for which his country is remarkable:

'When hungry, of the best I eat,
And dry and warm I keep my feet;
I screen my head from sun and rain,
And let few cares perplex my brain.'

The following is about the best theory of the matter:—Every man is born with a certain stock of vitality, which cannot be increased, but may be husbanded. With this stock he may live fast or slow—may live extensively or intensively—may draw his little amount of life over a large space, or narrow it into a contracted one; but when this stock is exhausted, he has no more. He who lives extensively drinks pure water, avoids all inflammatory diseases, exercises sufficiently, but not too laboriously, indulges no exhausting passions, feeds on no exciting material, pursues no debilitating pleasures, avoids all laborious and protracted study, preserves an easy mind, and thus hus-

bands his quantum of vitality—will live considerably longer than he otherwise would do, because he lives slow; while he, on the other hand, who lives intensely—who beverages himself on liquors and wines, exposes himself to inflammatory diseases, or causes that produce them, labours beyond his strength, visits exciting scenes, and indulges exhausting passions, lives on stimulating and highly-seasoned food, is always debilitated by his pleasures.—*Chicago Dollar Newspaper.*

THE TWIN GENII.

'And this world, ye ken, sir, and nane kens better, was made for Grief as weel as for Joy. Grief and Joy, unlike as they appear in face and figure, are nevertheless sisters, and by Fate and Destiny their verra lives depend on aye and the same eternal Law. Were Grief banished frae this life, Joy wad soon dwine awa' into the resemblance of her departed Soror. Ay, her face wad soon be whiter and mair wo-begone, and they wad soon be buried side by side in ae grave.'—*Noctes Ambrosianae.*

'Il n'y a rien plus près du rire que des larmes.'

THERE are twin Genii, who, strong and mighty,
Under their guidance mankind retain;
And the name of the lovely one is Pleasure,
And the name of the loathly one is Pain.
Never divided, where one can enter
Ever the other comes close behind;
And he who in Pleasure his thoughts would centre,
Surely Pain in the search shall find!

Alike they are, though in much they differ—
Strong resemblance is 'twixt the twain;
So that sometimes you may question whether
It can be Pleasure you feel or Pain.
Thus 'tis that whatever of deep emotion
Stirreth the heart—be it grave or gay,
Tears are the symbol—from feeling's ocean
These are the fountains that rise to-day.

Should not this teach us to calmly welcome
Pleasure when smiling our hearths beside?
If she be the substance, how dark the shadow!
Close doth it follow, the near-allied.
Or if Pain long o'er our threshold hover,
Let us not question, but Pleasure nigh
Bideth her time her face to discover,
Bow of Hope in a clouded sky!

A TWELVEMONTH IN CALCUTTA.

ARRIVAL—DESCRIPTION OF A DWELLING-HOUSE—BREAKFAST—TIFFIN—SERVANTS.

Chowringhee Road, Calcutta, December 17, 184——'Tis like a dream that I am really here, thousands of miles away from home, every object strange around me—scenes, climate, habits, all equally unlike everything to which I have been accustomed. My head is still confused from the effects of the sea, bewildered by the bustle of the landing, and almost disturbed by my arrival, so that I have difficulty even now, after one whole day and two quiet nights, in collecting my thoughts sufficiently to continue my journal. I finished the story of our voyage at the Sandheads, and begin again according to promise.

Late in the evening of the 15th we ended our long and prosperous voyage. We were towed up the river by a steamer, and anchored opposite to one of the ghauts, or landing-places, where a crowd of boats, servants, and carriages, appeared to be waiting to receive us. It was nearly dark. Indeed the light which enabled us to distinguish the half-naked figures grouped about the broad flight of steps before us, was produced by the many torches carried here and there by this mob of dusky forms, all of whose movements were accompanied by loud discordant cries. The splash of oars was next heard at intervals. There was noise on board too: people jostling one another, strangers arriving, voices inquiring, friends greeting, and shuffling feet resounding on all sides. In the midst of this bedlam a soft voice spoke gently in pretty broken English at my elbow: we were on the deck near the cuddy door, looking with bewildered interest on so strange a scene; and bending down to find out who addressed us, I saw by the light of the lamp on the table a small dark-coloured man dressed all in white, with a red turban upon his head, a lantern in his hand, and no shoes upon his feet; who, bowing low before us, presented a note to Arthur. All that followed was confusion. We were in our cabin again among bags, and boxes, and bundles; we were back upon the deck; we descended the shipside; we were in a covered boat; we went up steps; more turbaned figures bowed before us—a carriage then advancing, we entered it, and drove away through long roads, past large houses and many gardens, all indistinct and perplexing. At length the carriage stopped before high gates; a gong-like bell sounded, the gates opened, and the next thing I recollect was raising myself out of Caroline's arms; from all which incoherent account you will understand in plain English that Edward had been watching for our vessel from the top of the Semaphore Tower, and that whenever he caught sight of the smoke of the steamer, he had hurried home, and sent his servants with carriage and boat to meet us.

I cannot attempt describing that first evening—it was almost incomprehensible. The size of the rooms, the blaze of light, the style of the dinner, the train of servants turbaned and robed, tapping their foreheads, and bowing nearly to the ground as we passed on to the table, filled me with amazement, beside the old familiar voices, last heard in scenes so different. Strange that I should have slept sound after such excitement! I had been very wakeful the last few nights at sea, and probably nature was pretty nearly worn out. We are splendidly lodged; but you will like to have a full description of Caroline's house. You must recollect that this pair of your children are great people—Edward is a *burra sahib*, and Caroline is a *burra bibi*, and so they have a handsome house and all appointments suitable. It stands in what is here called a compound—a piece of enclosed ground laid out in garden fashion; and it consists of three storeys, the plan of each being pretty much the same—one long room extending from front to back right through the house, with three smaller rooms on either side of it. At the end opposite the entrance, running along the whole width of the building, is a deep veranda, rising storey after storey with the house. There is a large projecting porch and a handsome staircase, of such a size as to carry a great body of air up to the higher floors. On the ground-floor, the long room is the dining-room, opening into the veranda, which is filled with flowers, and has steps down to the garden. The six smaller rooms on this storey go by the name of *go-downs*; we should call them store-rooms or servants'-rooms. One is for the *obdur*, the person whose business it is to cool all the liquids; another is for the clerk, who keeps the books, checks the accounts, and also writes for Edward; the third is for the *ayah*, my sister's maid; the cellar, pantry, and lumber require the rest. The first floor is much loftier than the basement—very lofty to my eye. The long room makes a beautiful drawing-room, the veranda a charming addition to it. The suite of rooms on one side belongs to Caroline, that on the other to Edward; but as each of the six rooms has folding-doors into the long room, besides communicating in the same way through one another, and as the two end rooms—his study and her boudoir—open on the veranda, the whole apartments can be thrown into one when necessary. The dressing-rooms at the near end, which are also entered from the staircase, have each a bath-room taken off them, and space for a small spiral stair, that they may be reached from the outside, so that the low-caste servants, who have to attend in this department, never cross the floor of the house. The upper storey is a counterpart of the drawing-room floor. Arthur and I have it all to ourselves; and as the long middle room is unfurnished, we mean to put all our tin cases, &c. into it as soon as we get our goods from the ship and the custom-

house. The veranda is really a luxurious lounge in the early morning. In the evening, people prefer the house-top, which is flat, and is reached by the little spiral stairs belonging to the bath-rooms, carried on for the purpose. This is quite a different arrangement from any we are used to in England, but it is admirably suited to the climate, Cary tells me, as is the style of furniture; though, if you happen to be sitting over the fire in your snug library on a snowy day, when you read my Indian descriptions, you will begin to shiver at the thoughts of the comforts by which we are surrounded.

In the dining-room there is very little to be seen: a table, two side-tables, a sideboard, chairs, footstools, a mat over the floor, and on the plain white walls a row of wall-shades—that is, sconces for lights, which, on account of the numerous insects, and the draught of air from the punkah, are enclosed in tall glass shades. At this season the punkah is not used, we having luckily arrived in the middle of the cold weather. It is merely a long frame of wood, covered with calico, in shape like a door or shutter. It is suspended lengthways from the ceiling by cords, and is pulled by a string held in the hand of a half-naked servant, squatted in some corner out of the way. Punkah is the Indian name for fan; and before some bright-witted European invented these fans on a large scale, people had to be fanned by their attendants, as the natives are still: few of whom have as yet admitted the punkah. The air in the rooms during the hot season becomes insupportable, unless it be kept continually in motion. The drawing-room makes a much more agreeable impression than the very bare dining-room. The height of this storey is very striking—twenty-four feet. Many rooms, I understand, reach to thirty feet, and few are less than twenty: we can imagine the propriety of this in such a climate. The walls are coloured a pale drab, and a surbase of cheenam-painted wainscot runs all along round the room—the floor of which, by the way, is composed of the same material, cheenam, a kind of fine lime. None of the roofs are ceiled. The rafters supporting the floor above are necessarily left exposed, in order that the depredations of the white ants may not escape detection; but in the drawing-room these beams are so ornamented, that the effect, combined with the lofty height, is perfectly agreeable. A finer description of matting is laid down here. There is a good deal of handsome furniture—consoles, marble and ebony tables, chairs, sofas—quantities of sofas—and a footstool before every seat, these being in universal use. Yet the room looks empty, in spite of a number of nick-nacks distributed over the tables. Cary tells me that in a little time I shall dislike to see it more full, space and air being first luxuries here. I should like, however, now to be able to move the chairs occasionally, which is at present quite impossible when they are made either of ebony or black wood, as they have no castors, and their weight is quite beyond my poor strength. The cabinet-work is generally very clumsy, and the art of polishing, finishing, or varnishing properly is as yet unknown. The height of the doorways corresponds to the height of the rooms, varying from twelve to fifteen feet, and they are very wide: you cannot think how very small we all look when passing through them. The door itself is commonly a mere screen of fluted silk, set in a frame raised two feet from the floor, so as to admit of a free draught of air underneath. These screens are only about four feet deep, just sufficient to prevent any one peeping over them. It would hardly do to have a secret to tell in these most public apartments, there not being one mysterious corner safe from a listening ear. The windows are equally gigantic in their proportions; they all reach down to the floor, opening like French windows; but the shutters are Venetians, folding back on

the outside, and always kept closed during the heat of the day. There are glass casements besides—very wretched glass in very clumsy frames—not often cleaned either, I should think; but as nobody ever wants to look through them, the defect in this department the less matters. The drawing-room windows—three large ones—open on the veranda, as do the windows of the boudoir on the one hand, and the study on the other, forming a most enjoyable suite. The veranda is thus very long—the whole length of the breadth of the house—and very wide; the same height as the storey it shades, supported on each stage by six very handsome pillars, between which always stretches a latticework to keep off the sun, on the same principle as the fluted door-screens within, two feet from the floor all along, and rising a little higher than the head.

The kitchens are all out of doors—cook-rooms they call them here. A small enclosed yard is taken off the compound, inside of which are all these offices; and the wall being covered on the garden side with creeping plants, it is rather ornamental than otherwise. You will wonder I have said nothing about servants' bedrooms. They don't want any. They lay themselves down anywhere—on a landing, in the porch, in the veranda, in a deserted room—some merely protected from the cheenam floor by a mat; a better sort lay a mattress on the mat; a still superior class place over their simple bedding a frame of bamboo covered with a coarse sort of muslin gauze, to protect them from the mosquitoes. The men who sleep on the basement storey, which is often damp, have all a sort of low bedstead, something like our trundle bedsteads, to support their mattress. As for our ayah, she, being a Portuguese Christian, and very grand, has a bedstead like ours, a fine mat, good mattress, cotton sheets, a coverlet for cold weather, and proper mosquito curtains, tucked round her as carefully as our own. She came from Bombay with some lady, who, on going home, left her to Cary as the most precious of legacies, for the native ayahs are not generally good here. I must hunt out the best I can hear of for myself to-morrow, for whose sleeping-frame we have certainly sufficient accommodation in some of the numerous rooms belonging to our apartment.

18th.—We were roused about six o'clock on the morning after our arrival, the 16th, by the announcement that the baths were ready. Everybody bathes every morning, some people twice a day. We in this family all take warm baths, prepared in a large oval tub by the water-carrier; but the general custom is to sit on a little stool in a part of the bath-room fenced in by a six-inch-high border of cheenam, and then have *chatties* (jars) of cold water dashed all over the person. After this most agreeable restorative—the hot bath, not the cold—we adopted a graceful negligé; and Arthur in his dressing-gown, and I in my wrapper, we repaired to the veranda, where we were presented with cups of milk-coffee and a sort of rusk; then opening a shutter in the latticework, we peeped out upon what we agreed in thinking a very pretty town view—a mixture of large white buildings and green trees. Such is the general appearance of Chowringhee, which some few years ago was a mere jungle or thicket, as Calcutta itself once was, and would become again were it deserted by the Europeans. Our observations were cut short by the pain of mosquito bites. They became, as the sun rose higher, so exceedingly irritating, that we were glad to re-enter our dressing-rooms and finish our toilets.

The breakfast hour is nine o'clock. It was served in the study, as much, my sister said, out of regard for the books, as from the comfort of the arrangement: if she were not to have her eye daily upon them, the damp of one season, the heat of another, and the white ants above all, would soon make sad havoc among them. All furniture suffers in a degree from these elements of destruction. The houses even have to be regularly inspected every three years, that any symptom of decay may be arrested at the commencement. I found that

breakfast was a visiting time, one or two friends on an intimate footing dropping in on their way to business. Their conversation did not in the least interfere with our proceedings, and there was no light labour set before us, for the meal appeared to me to be breakfast and luncheon in one. Besides the usual tea, bread, butter, toast, eggs—very small eggs, by the way—there was rice boiled plain white, and rice dyed yellow, curry, fish, and cababs, little thin cutlets highly seasoned, fried or roasted quite dry, and strung upon a skewer. The butter was very sweet, but not rich. It had been made just before it was wanted, in a bottle, I believe, by one of the servants, and cooled by the obdar. Buffalo milk being too poor for use in tea, goat milk is preferred, milked at the moment it is required, and sent up with the froth on it. I thought the bread delicious. There were many sorts of it, white, and light, and sweet; but I hear I shall find it to be tasteless when I forget to compare it with what we have been latterly eating on shipboard.

Edward and one of his visitors went off together, Arthur being to follow in an hour, to try to get all our luggage through the customhouse. Caroline, who had finished her household affairs early in the morning, brought her work into the large drawing-room, ready to listen to all my tales of home, when the bell at the great gates announced more company. A single stroke prepared us for a gentleman, two strokes foretold a lady; we were therefore always certain of the sex of the arriving guest, and plenty of both sorts visited us this forenoon; none of them ostensibly to call on Arthur and me, the etiquette of Calcutta, like that of France, requiring the last importation to wait upon the older residents; but we could not help fancying that curiosity had some share in producing this influx, and Cary was vexed she had not desired the porter to keep the great gates closed, as then nobody would have thought of entering, that being understood to mean in the plainest manner 'Not at home.' A very good plan, saving both time and trouble. Arthur returned alone to luncheon, or *tiffin*, as we must call it here—a very substantial repast, served in the dining-room. We had cold meats, fowl very well dressed in a Burdwan stew, some native vegetables, not very good, several dishes of fruit, none of them agreeable to an unpractised taste, wine, and that delightful light bitter beer, cold as ice could make it, the most refreshing of all drinks in this climate—not that it is just now at all too hot. The sun is fierce enough in the middle of the day, and might then for a few hours annoy those much exposed to it, but the temperature within doors is very pleasant. The mornings and evenings are indeed rather cool, and the nights are cold, the thermometer on the landing, each time I have looked at it on my way to breakfast, was only 58 degrees. After *tiffin*, as we were sure of no more interruptions, nobody ever calling so late in the day, we busied ourselves with the contents of one trunk it had been represented we could not do without. I had packed it with a few essentials in case of any delay about the rest of our boxes, and I had also put into it some little presents from the family at home to Edward and Caroline. It contained also the little offerings of their children—copy-books, exercises, drawings, needleworks, gifts so precious to bereaved parents. Poor Cary! she carried them all off to her own apartments, jealous seemingly of any other eyes examining these treasures. She had questioned me minutely about everything concerning the little creatures over and over again, and she had listened with calm interest to my answers, but the sight of the children's handiworks overcame her. I did not meet her again till the seven o'clock dinner, and both she and Edward were quite subdued in spirits all the evening. We retired to bed at ten, the usual hour when there is no company, it being the custom to rise very early in the morning.

Warned by the interruptions of the day before, we were wise enough yesterday to close our gates, as we had a great deal of business to get through. All our

ship luggage arrived, not very much deranged by the unceremonious unpacking and repacking which had been the amusement of the customhouse officers. Also, we had our establishment to arrange; for not only will no servants here wait on more than one master, but every master requires near a dozen servants to assist in attending on himself. The family domestics, therefore, numerous as they are, are useless to us; and so we have to hire a set of our own, moderate as must necessarily be our expenditure. This is no sort of annoyance to our hosts. All servants in this country are on board-wages: where or how they eat nobody seems to mind; they sleep either at their own homes or all about the house, as I have described to you; and those who attend at table follow their masters wherever these may happen to go, to wait on them at every house to which they may be invited. The wages are paid monthly, and are very small, though of course proportioned to the dignity of the different offices. For a few rupees, more or less, they all feed and dress themselves, and furnish their own bedding, receiving little beside their pay, except perhaps a new turban or cumberband if the master be particular in desiring them to wear the colours of his home livery. Trifling as this sum is, it must be ample, as they are all married, and no women going to service here almost, or indeed doing much labour of any kind, on the husband's earning depends the whole support of the family. The only females in any house are the *ayah*, the *amah* or *dye*, who nurses the children, and the *matronee*, or low-caste waiting-maid.

19th.—We shall very soon have our retinue organized. For Arthur and me, who have, as you know, been accustomed to wait on ourselves, or we should not be now in the far East, to fight our way to fortune in this sultry land, the following train of attendants is considered requisite:—Arthur must have a personal servant, who, doing nothing more than help him to dress and undress, and take care of his clothes, must have two assistants, his mate, who works under him, and a *mehter*, or sweeper—a low-caste person; also a *dirjee*, or tailor, to make and mend: the valet, called a *sirdar*, is the chief of the bearers, or *punkah-wahlers*—literally, *punkah-pullers*; they would carry the palanquin if we had one, and they do all the lighter part of a housemaid's work—an easy enough task where there are neither grates, nor curtains, nor carpets, very little furniture, and the bed-making consisting only of turning a mattress, shaking a pillow, and laying a sheet smooth; they have also charge of the lamps, little glass cups filled with water, having some cocoa-nut oil poured on the top, and a wick set in them. We mean to do with one of these gentry, if we can manage it, at least till the time comes for using the *punkah*. We have also each of us a table attendant, or *kitmudgur*, and one *chuprassie*, or messenger. I must have an *ayah* to wait on me, and a *matronee*, or female sweeper, to wait on her; and I mean to do without a *dirjee*. Just add up all these attendants on a poor barrister and his wife visiting rich relations, who would be living at home with scarce a servant at all. There's a *dhobee* also, or two I believe, to wash our clothes, and a *theestie*, who brings us all the water wanted. Such a suite sounds very grand; but really one good English maid would go through more work than all these poor creatures together, who sleep, and eat, and smoke, and gossip twenty-two hours out of the twenty-four.

Imagine the number of Caroline's servants. The *sirdar*, who is Edward's valet, his mate, four *punkah-wahlers*, the *dirjee*, *dhobee*, and sweeper, four *chuprassies*, or *hir-karees*—they are called indifferently either—messengers, with their chief, or *jamadar*, who wears a dagger with a tassel to it sticking in his cumberband—a very great man indeed, devoted to the service of his lady, sitting always outside the drawing-room door, to announce visitors, by preceding them into the presence, and to deliver the messages to his followers, who carry them—a groom of the chambers in fact—three *kitmudgurs*, who wait at table, one of whom has charge of the wines and other

liquors, even helping the guests without interference, no other attendant ever being allowed to touch a decanter: he still goes by the old-fashioned name of *obdar*, for he still cools the wines, though not by the old tiresome saltpetre process, now quite superseded by the introduction of ice; then there is a cook and two assistants, a porter, a gardener, and four very splendid gentlemen in scarlet robes edged with gold lace, who carry long silver sticks in their hands, from whence their name of *chobdar*. These ornamental appendages to the great men of the place are paid by the Company, and were originally employed only on state occasions, preceding the judges into court, or the other high officials into their offices; but it has grown into a habit to have two of them ever on duty, and to take one of them out with the carriage, even with the ladies of the great men when visiting. The head of this establishment is the *consomaun*, answering to our house-steward, on whom the whole management of the household devolves: he markets, hires the inferior servants, keeps the stores, the plate, and the weekly money. The stable is quite a separate affair: there are two coachmen, who do nothing but drive; a *syce*, or groom, to every horse; and grass-cutters, who have to hunt out and grub up the forage—grass roots—for no herbage is visible till the rains set in, which, with the addition of a small pea called *gram*, used instead of corn, constitutes the food of the horses. Before the children went home, there was a large train of servants kept for them. Besides Caroline's own ayah, and *dirjee*, and *matrance*, there was an attendant, male or female, for each child, according to its age, not sex; bearers to drag the little carriage in which the infants took their airings; a *syce* for each pony used by the elder ones; *dhobeas*, *dirjee*, *bheestie*—all belonging exclusively to the upper storey where Arthur and I are now established, with very near as full a suite. Were it not for the *consomaun*, such a crew of idlers would be rather unmanageable; and as for selecting our portion out of such a poor-looking set as came to offer themselves, we could not have attempted it without his assistance.

The people in this part of Bengal are said to be physically and morally far below the general standard. Caroline's ayah looks down extremely on them. She is certainly active and intelligent beyond the rest; yet I hardly think much of the European blood can now remain amongst these descendants of the early Portuguese merchants. As for their religion, it would be still more difficult to trace any of the genuine gospel in the few traditions of it they retain, mixed up with much of the Mussulman's fatalism, and the superstitious devotion of the Hindoo to caste and custom. One or two of our servants are Mussulmans, a gentle people, more decent in appearance than the lower orders of Hindoos; much better dressed too; no naked portions of dark skin to shock English eyes: they all wear trousers, white or coloured as may be, but tight fitting; a long tunic of white cotton open at the breast, a turban, and a belt when in full dress, slippers when not in presence of their superiors. The *consomaun* is very handsomely dressed, as befits his superior station. The *punkah-wahlers*, or bearers, are nearly naked—just a cloth about the loins, and a turban: they all move like phantoms; not a footfall is ever heard; the bare sole treads soundless on the matted floor; the soft dress brushes noiseless against obstructions; there are no doors to shut; the low-toned voice is never obtrusive; they move slowly, never hurry, and they watch those they serve with such scrupulous anxiety, that when once accustomed to our ways, we very seldom have to ask for anything. I am not quite sure that I shall like this sort of forestalling of my inclinations. I felt inclined to rebel to-day at dinner, at ale having been brought to me at the same period of the repast as I had called for it yesterday; but the beseeching manner of my gentle flapper, the fat *kitmudgur*, made me feel there would be unkindness in refusing him; so perhaps I have condemned myself to Abbott's pale ale during the

rest of our residence in India. We shall have our own servants to-morrow, when we may, I think, represent to them that we dislike what we call officiousness: the feelings of that fat, most civil waiter I could not have wounded.

BARON REICHENBACH'S RESEARCHES.

SECOND ARTICLE.

Of the two classes of sensations produced upon sensitive subjects by magnets, crystals, bodies of high chemical affinity, heat, light, electricity, chemical action, vital action, the human hand, and the heavenly bodies, we forbore in our last article to make special allusion to the second, or the sensations of luminosity which *odylic* bodies cause in a darkened room. Our reason was, that the author, although including the luminous phenomena in his earliest treatise, has devoted the subsequent treatise exclusively to this department of the subject, and has laid out systematically the results of his observations on each of the specific luminous appearances that showed themselves.

The Odylic Glow.—To the sensitive person, a magnet in the dark seems to glow with a feeble light, as if it were phosphorescent or heated; but the light seems quite different from any of the shades of heated iron. In its feeblest form it is a dull dark-gray; but as the intensity increases, it rises to whitish and yellowish, and generally assumes at the northward pole a bluish, and at the southward pole a reddish tint. The two colours of blue and red are as characteristic of the two *odylic* poles respectively as the cool and warm sensations; the blue corresponds to the cool agreeable sensation; and the red to the opposite sensation of warmth and discomfort. The action of other magnets greatly modifies the glow of the one specially made use of; and consequently the earth's magnetism has an influence, which comes out by varying the position of the magnet. The intensity of the light, as well as its colour, may be affected by extraneous *odylic* agents, in a manner depending on the action of those agents, which action may be either conspiring or conflicting. If the earth's magnetism be made to coincide with the magnetism of a bar, by placing the bar in a conformable position, or with its north end to the north, the colours will be made deeper; while in an opposite arrangement, the glow and colour become dull and turbid. When a horse-shoe magnet is closed by its armature, the glow of the curve is increased, and of the ends diminished; whereas an open magnet is always brightest at the ends. The intensity of the light and colour seems in all cases to be proportional to the intensity of the magnet. The same appearances are shown by crystals and the living hand.

Odylic Flames.—On this head the baron introduces his experiments in the following terms:—'In the preceding experiments on the glow, the flames flowing from the magnetic poles followed everywhere the same course. This phenomenon forms the second degree in the scale of the *odylo-luminous* appearances, and consists in a light, which, to the more feebly sensitive, appears as a vague gleam over the poles, but which the more highly sensitive, according to the degree of their perceptive power, saw gradually passing into the aspect of a real flame, under which name they described it. There are magnets which exhibit the glow without the flame, but none which have the flame fail to exhibit the glow. The glow is always the first luminous appearance. I once had a horse-shoe, which had become so weak as not to carry its armature, but still retained perceptible traces of magnetism. I showed it to Mademoiselle Zinkel in the dark chamber, at a time when she was very highly sensitive to *odylic* light. She saw the whole magnet glowing, but could perceive over its poles no flame, only a feebly-luminous smoke. When the *odylic* intensity is increased, the flame is added. We are entitled to assume that the flame exists everywhere, but we can only speak of it where it becomes visible.'

Out of many experiments on various sensitives, he selects as an example the following description by Mademoiselle Atzmansdorfer:—'Towards the end of summer, when she is generally better, she saw, on a weak bar magnet of twenty inches, flames little more than an inch in height. At the same time she saw, on the poles of a seven-bar horse-shoe, flames of eight inches high. Afterwards, when more sensitive, the largest of my magnets, a heavy horse-shoe of nine cast-steel bars, was placed before her in the dark. Although she did not know which magnet was used, she saw again, as she had done a year before, flames of fully five feet in height burning on both poles. They were so large, that when the poles were upwards, they rose, and united into a column of fire. She could see, by the somewhat different colours of the flames given out at the two poles, that this column was formed of two, the one yellowish-white, the other bluish; the former smaller than the latter. The whole dark chamber was so illuminated by them, that she could see in it the outlines of all objects. Between the limbs, which had a white odylie glow, she saw the whole space filled with threads of flame, and the outer surface of the steel enveloped all round in a fiery down, which undulated, and appeared to flow sometimes towards one pole, sometimes towards the other. At the planes of junction of the lamellæ, and at their edges and covers, where they form the poles, there were separate small flames flowing out laterally, and strongest on the outer corners, where they at last ended in sparks, which flew singly away.'

The author made a great number of observations on those flames, with a view to detect all their peculiarities. He describes the effects of the contact of the magnet with other magnets in all possible ways; but perhaps the most singular feature attending them is their upward motion and susceptibility to the breath. They can be blown or fanned about like a column of smoke. This would seem to indicate that they are some ponderable substance like air, or the illumination of a ponderable medium, either air or something that air can impel hither and thither. Whether or not it be illuminated air, can be tested by placing the magnets in the exhausted receiver of an air-pump, which, as we shall afterwards see, was actually done.

The author makes the following practical application of the experiments regarding the odylie flames:—'In concluding these details concerning the odylie flame, I shall make one more practical application. It is a fable widely spread in Germany, and which has been often made by our dramatic poets the ground-work of the most striking scenes, that ghosts, witches, and devils, assemble for their hellish dance by night on the Blocksberg. Everything in the world, even such a fable as this, has a cause or origin in nature; and we can now see that this myth is not destitute of a natural foundation. It has long been known that high on the Brocken there are rocky summits which are strongly magnetic, and cause the needle to deviate. More minute investigation has proved that these rocks contain disseminated magnetic iron ore or lead-stone; as on the Ilsestein, the Schnarher (Snorer), &c. The necessary consequence is, that they send out odylie flames. Now when persons of high perceptive powers for odylie light happened to come on such places in a dark night, as must often have been the case with hunters, charcoal-burners, poachers, woodcutters, &c. they necessarily saw, on all sides, delicate flames of different sizes and colours, flaming up from the rocks, and in the currents of air flickering hither and thither. Who could blame these persons, imbued no doubt with the superstitious feelings of their age, if they saw, under these circumstances, the devil dancing with his whole train of ghosts, demons, and witches? The revels of the Walpurgisnacht (the night which ushers in May-day) must now, alas! vanish, and give place to the sobrieties of science—science which, with her torch, dissipates one by one all the beautiful but dim forms evoked by phantasy.'

Odylie Threads, Fibres, Down.—Magnets, besides the

polar flames at their edges and solid angles, emit lights in the form of a fibrous down. Mademoiselle Atzmansdorfer saw, 'both in a nine-bar and in a seven-bar horse-shoe, the space between the limbs full of fibrous flames, and the whole surface of the magnet clothed in a fine fiery down.' 'These delicate emanations also exhibited colours. Mademoiselle Zinkel saw the down between the limbs of the simple horse-shoes, red on the one side, and blue on the other, playing into one another, so that the interior space had a variegated appearance. With compound horse-shoes, this was still more strongly marked, because each limb, from the stratification of colours in it, had both red and blue down, extending, within and without, from the poles to the curve.' The author observes with reference to the nature of this appearance:—'I do not regard these appearances as of a peculiar kind, but rather consider them as of the same nature with odylie flame generally. The cause of them probably lies in inequalities in the efflux from the minutest points of the surface of the magnets. Since we know that edges and solid angles give rise to stronger emanations, I think we are justified in concluding that finer inequalities may serve as points of efflux, and thus give rise to the formation of threads, fibres, and a downy form of light. They are locally concentrated currents of odyle in the general odylie current, blue from the negative, and red from the positive pole.'

Odylie Smoke.—'Mademoiselle Zinkel saw, in a series of experiments, to enumerate which would be tedious, on every magnet of any power the red flame passing into a thick, heavy, feebly luminous, reddish-yellow smoke, and the blue flame ending in a fine, ethereal, grayish-blue vapour. On smaller and simple horse-shoes, these cloudy emanations were from four inches to a foot or more in length; on the nine-bar magnet often as long as an arm, and when it had been strengthened, six and a-half feet long. Magnets of great intensity appeared to her, especially during the catamenia, covered near the poles with a thin vapour. Above the stratified flames of compound horse-shoes, she saw the smoke rise to the length of an arm. . . . In the presence of Mademoiselle Atzmansdorfer, and in the dark, I drew lines with phosphorus on paper, and showed her the luminous vapour arising from it, and also the effect of blowing on it. She assured me that it had the greatest resemblance to the odylie smoke, except in the intensity of its light, that of the odylie smoke being beyond comparison paler and feebler; it was also not so green, but more blue and reddish.'

The author is of opinion that the flame and smoke 'are perhaps only the same phenomenon, varying on the one hand in degrees of intensity, and on the other differently perceived according to the sensitiveness of observers, or in the same observer according to the more or less perfect development of his perceptive power, either from variations in his natural state, or from the effect of longer or shorter exposure of the eye to perfect darkness.'

Odylie Scintillations.—'The finest development of this phenomenon was seen by Mademoiselle Zinkel in a large electro-magnet, excited by the current from a powerful Smee's battery. Not only did the sparks fly out on all sides from the large variegated flame, but they formed a shower, or rather a stream, which rose constantly to the ceiling. They were so bright that she could not conceal her astonishment at my not being able also to see them. . . . The occurrence of this phenomenon, established as it is by the unanimous and uniform testimony of so many sensitives, both diseased and healthy, and confirmed by countless repetitions, admits of no doubt. I do not allow myself for the present to form any conjectures as to its nature, or even the relation which it bears to the other phenomena of magnetism or of odyle with which it is associated. I can here only establish the physical fact, as it actually presents itself to the eyes of the sensitive.'

The baron next goes on to detail the results of experiments upon the effect of the pressure of the atmosphere upon the different luminous appearances above described. By enclosing magnets in the receiver of an air-pump, and exhausting the receiver, he found that almost every form of the light became much brighter and stronger; the glow was more intense, and flames more brilliant. The smoke does not follow the same law; extreme rarefaction had the effect of causing it to disappear. Thus it would seem that magnets actually emit a ponderable effluvia, just as odorous bodies emit an effluvia of smell, but of an excessively thin and feeble character, requiring an exalted sensibility for its detection. There is thus suggested to us the existence of an entirely new property of matter, such as, if thoroughly cleared up, may throw light upon the parallel property of smell, which is not in all cases explained by the evaporation of volatile ingredients.

Colours of Odylic Light.—We cannot enter into the author's minute researches on this part of the subject, intended to prepare the way for the identification of the aurora with the odylic appearances. He found, on close examination, that the light at the poles of the magnet was not of a single colour, but an iris succession of colours more or less complete, one being predominant at each pole. He sums up the phenomena in their application to the aurora as follows:—"But now that we know, from the preceding researches, that flaming lights exist over magnetic poles larger than the magnets from which they flow; when we learn that these flaming appearances are movable, undulating, often moving in serpentine windings, like those of a ribbon agitated by the wind, becoming at every moment larger or smaller, shooting out rays, scintillating, variegated in colour, and often nebulous, vaporous, and cloud-like; when we find that with our breath we can cause it to flicker backwards and forwards; when we observe that it increases in a rapid ratio, in size, intensity, and brilliancy, in rarefied air; and lastly, when we see it followed at every step by the play of rainbow colours, &c. &c.—there remains hardly one essential mark of distinction between magnetic light and terrestrial polar light; unless we regard as such the difference of intensity and amount of light, in virtue of which the polar light is visible to every ordinary eye, the magnetic light only to the sensitive eye."

The undulations and serpentine windings which the aurora borealis often displays, are, on the supposition of the identity of the two lights, naturally and simply explained by the motion of the wind, which causes the light of the earth to wave to and fro in more or less rarefied strata of air, precisely as our breath does with the odylic light of magnets. The constant alternations of greater and smaller size in the aurora, correspond exactly to the unsteadiness of the magnetic light in our experiments. The powerful light from great and undetermined heights in the atmosphere, observed by some travellers to lie higher than the higher clouds, agrees beautifully with our observations on the magnetic light in the exhausted receiver, where the odylic light increased strikingly in size and brilliancy under half of the ordinary atmospheric pressure. But the equally well-attested and even more numerous observations of other travellers, who have studied numerous polar lights with the most conscientious attention in the polar regions, to whom their height appeared very much less, and who often described them as luminous clouds, also harmonise perfectly with the nature of the odylic light of magnets. We have very frequently, in the course of these researches, met with the odylic phenomena of luminous nebulae or vapours, flame-like smoke, or whatever name may be given to the varieties of this appearance. It also increased in strength under diminished pressure. This is the cause of the appearance of luminous clouds constantly rising, which render complete the parallel between the odylic light of magnets and the polar light of the earth."

* In connection with this part of the subject, an old

remark made by the Swedish philosopher Wilke deserves to be recalled to memory—namely, "that disturbances of the magnetic needle always precede the appearance and the motions of the aurora borealis." This, as we have seen, agrees most exactly with the phenomena of odylic light; for these always occur later and more slowly than the associated magnetic or electric effects, which are only followed by the odylic effects after an observable pause. The same facts which I have ascertained in my dark chamber were, therefore, many years ago noticed in the wide expanse of heaven by other observers."

The editor has added a short appendix, in which he describes experiments made by himself, in corroboration of Baron Reichenbach's results. It is obviously desirable that the experiments should be repeated as much as possible; but we must bear in mind that they require all the nicety and precautions belonging to any other abstruse department of experimental research, and cannot be done justice to by the random attempts of unskilled curiosity and imperfect appliances.

HOW TO LIVE IN LONDON ON A SMALL INCOME.

THERE have been many useful little books published within the few last years, under such titles as 'The Poor Gentleman,' and 'How to Live on Fifty Pounds a Year.' They profess to point out to persons of very straitened incomes how they may contrive to maintain an appearance of *outward respectability* on the slenderest means—on an income, in fact, very little superior to the ordinary, and far beneath that of the skilled, mechanic. I cannot help thinking, however, that most of these little books are to a certain extent *made up*, and not the result of real experience or even direct observation, because I find in some the various items of expenditure entirely disproportioned to the gross income, while in others they seem to fall short of what may be fairly appropriated to each charge. I, unfortunately, can write on this subject from experience, for it so happens that, having been, by unforeseen calamity, reduced from two thousand a year to a mere pittance, I have been compelled for a twelvemonth past to realise something like the very problem involved in the second title above quoted. I am now, in short, a poor gentleman. If the reader chooses to listen for a brief space to my story, I think he will be informed of the chief arrangements actually required to maintain a respectable existence on the scale in question.

Having come to the metropolis in hope of procuring some employment, about the spring of last year, I secured a very pleasant furnished lodging, in the best part of Notting Hill, at 6s. a week. My domicile consisted of a small sitting-room and bedroom, not quite so lofty or spacious as apartments would generally be in *Belgravia*, but sufficiently large and airy to answer my purpose. Bed and table linen, and attendance at breakfast, the only meal I took at home, were included in the rent. The literary pursuits in which I shortly became engaged fully occupied the day. I may here remark with what pleasure I became in a little time aware of the ample resources which are at the command of the poor student in London. Independent of our splendid National Library at the British Museum, there are two others—that of Sion College, and Dr Williams's in Red Cross Street—which contain very valuable collections of books. There is also for the Oriental scholar an excellent library at the East India House; and all these, by the liberality of the trustees or directors, are easily accessible to any respect-

able person. Previous to the setting in of winter, I removed to a comfortable lodging in a very airy street, in the vicinity of Leicester Square, paying for a bedroom, with attendance as before, 6s. 6d. a-week. My days passed away cheerfully, for my mind being fully occupied, had no leisure to turn inwards, and reflect on the vicissitudes I had experienced. The labours of the day over, I repaired to the Whittington Club, to partake of a frugal dinner, followed by coffee, after which the remainder of the evening till midnight was generally passed in the reading or drawing-room of the club.

I will now proceed to detail my weekly expenditure, which has, from stern necessity, been confined within such narrow limits as not to admit, even in the extreme rigour of winter, of a fire in my room to breakfast by. But although at first this comfort is missed, it is surprising how soon one becomes accustomed to the want.

Being per annum, L.39, 6s. 6d.

Sundays being always passed with some friends, I have not included in my expenses, though I should on this account put down occasionally a sixpence for a bus; nor have I set down anything for wearing apparel, for, being possessed of a good stock of all descriptions of clothes, I have not had occasion during the twelve-months to expend more than a pound in this way. What I have given above is actually and *bonâ fide* a true return of my personal expenditure; and it will, I think, prove what can be done, when the exigency of the case requires it, by a determined course of the most stringent and rigorous economy, and by the unwearied exercise of self-denial and uncomplaining patience.

I am sensible, however, that it is on much too limited a scale for a young person with a moderately good appetite, nor would I recommend it to such a one, as, unless compelled thereto by dire necessity, it would be inconsistent with the generous feelings of youth, and would, if indulged in, necessarily lead to mean and miserly habits, which I am the last to hold up to imitation. But I will proceed to offer what I consider to be a tolerably fair estimate for a bachelor, who is compelled only to live frugally, not narrowly. As a necessary preliminary, without which all the rest is mere moonshine, I will suppose him, either from the sharp spur of adversity, or from having been originally condemned to narrow means, to have acquired that self-discipline, and those fixed habits of self-control, which will enable him to submit cheerfully to his lot. I believe that the following scale will suffice for a person of limited means and of moderate desires; and if he should not consider it enough, London is just the place where, in some way or other, by the exercise of his wits, he may generally find the means of adding to it:—

Per annum, L.66, 6s.

The list of prices for breakfast and dinner are those of the minimum class at the Whittington Club; but should it not suit a person's taste or inclination to join that institution, he can live for nearly the same money at any respectable eating or coffeehouse; and the two guineas which he would have to pay as an annual subscription to the club will about pay the fees to waiters, &c. I have not made any allowance for wine, beer, or spirits, as they are scarcely attainable, where the income is very limited, without the sacrifice of something more essential. I can only say for myself that, after having been in the habit of taking a moderate quantity of wine,

I never enjoyed better health, and, as I think, more even spirits, than since I have been obliged to drink plain water; and as a proof that fermented liquors do not render a person more capable of undergoing any extra fatigue, I will mention that I am sometimes in the habit of walking from seven to eight or nine miles without feeling any inconvenience.

It may be some consolation to those who either have met with, or expect, reverses of fortune, to know that I can now, from personal experience, solemnly assert that I am a much more contented, and consequently a much happier man, than when I was in comparative affluence. I will suppose that a young man is not without some friends, or probably relatives, in this great metropolis. In such a case I would recommend him not to be too eager to jump at every invitation to dinner, &c. He will best preserve his independence, and be a more welcome guest at other times, by occasionally declining to avail himself of the proffered hospitality. At the same time there are many little services which he may derive from worthy acquaintance; and, as it occurs to me at the moment, I would advise him to be directed in the choice of a laundress by some respectable family to whom he may be known. Both in the prices charged, and the manner in which his linen is attended to, he will find the advantage of this hint. Estimating an income at barely a hundred a year, I think the margin I have left, of upwards of thirty pounds, will, at the present extremely moderate prices of every article of dress, be found sufficient for that branch of necessities. A person who aims only at appearing gentlemanly, will be more likely to secure real and desirable friends, than by aiming at finery, which he must procure either by contracting debts, or pinching himself in some more requisite expense. In the play of the 'Poor Gentleman' there are some admirable remarks on the *meanness* of incurring debts which a person knows he cannot calculate on honestly discharging, and the loss of that independence and peace of mind which assuredly awaits the embarrassed man. I would advise that the bill for lodgings, &c. &c. should be settled weekly, and that purchases of every kind should be made for *ready money*, which will be found, on the average, to involve a saving of from 20 to 25 per cent.—no small consideration to a man to whom we will suppose every shilling has its value. If a person has a fixed employment, he will of course have his time fully occupied; if he has not, he need not be wholly idle. Books and study should form a part of the daily distribution of his time. Although public amusements must be but sparingly partaken of, they need not be wholly eschewed. The Amphitheatre at the Haymarket, the boxes at the suburban theatres, and the pit at the minor ones, are all at the same price (two shillings). London abounds with places of worship of all denominations, and at many of these there are free sittings. St Paul's and Westminster Abbey will rise to every mind, as places where the beautiful cathedral service is admirably performed. The musical parts of the ordinary service are also presented very beautifully by the pupils of the Royal Academy of Music, at the Hanover Square Chapel, and by a full choir at St Mark's, Clerkenwell, at the church in Wales Street, and at St Paul's, Knightsbridge.

Before concluding these brief remarks, I will advert to a subject which I deem to be of paramount importance to all persons whose incomes are of a very restricted nature. I will simply premise that I have no wish to 'write up' the Whittington Club; nor, indeed, does it stand in need of such support. The public are gradually becoming acquainted with its merits, as is evinced by the number of members—now about 1900—who support it. What I have simply to remark is, that the varied and rational character of the amusements offered by this club, for the very moderate subscription of two guineas per annum, seems to render it a very suitable resting-place for the poor gentleman. I will just go through the weekly list, merely stating that in the three

summer months—from June to September, when persons are more disposed to breathe the pure air out of doors—some, but not all, of these are suspended:—

On Monday Evenings,	Class for Historic and Dramatic Literature.
... Tuesday ...	Music, Dancing, and Conversation.
... Wednesday ...	Discussion Class for subjects of general interest.
... Thursday ...	A Lecture, generally by some eminent professor.
... Friday ...	French Elocution Class.
... Saturday ...	English Elocution Class.

With the exception of the historic and dramatic class, the subscription to which is 2s. 6d. per quarter, the whole of the entertainments enumerated in this list are free to every member of the club who may choose to attend. In addition to these, a monthly concert of vocal and instrumental music is given on Monday evenings by the amateurs of the club, assisted occasionally by a few professionals, and which may fairly challenge comparison with most amateur performances. There are two reading-rooms, amply supplied with numerous London and provincial journals, French and German papers, five quarterly journals, and all the most popular weekly and monthly magazines, papers, and serials. To the man not overburdened with money, the advantage of good fires and well-lighted rooms will suggest itself.

I have now performed my task. But before I bid adieu, let me urge you, gentle reader, if you are living on a slender income, without any regular employment, to devote some hours of every day to the perusal of such books as may be most congenial to your taste. Whatever you do, do not waste the whole of your time in listless indolence. If you are young and active, cricket, rowing, fives, football, &c. may vary your more solid occupations; but the mind requires to be exercised, to prevent its relapsing into the morbid condition so beautifully described in that touching passage—'My soul is weary of my life: I will leave my complaint upon myself: I will speak in the bitterness of my soul.'

A HUNTER'S LIFE IN SOUTH AFRICA.*

SOME years ago the London public were edified by the exploits of an amateur thief-catcher, who was accustomed to lie in wait for rogues as rogues lie in wait for true men. No sooner was a robbery detected, than off he set in pursuit, heading the police like a greyhound, and tearing down his prey before anybody else could come up. This virtuous individual was the son of a baronet; and all the account he could give of his motives was, that in devoting his time and thoughts to the capture of depredators, he merely obeyed an instinct. This was a curious instance of that oddly-directed enthusiasm which receives the name of hobby or monomania, according to the disposition of the observer; but it was a very insignificant aberration from the beaten path compared with the Nimrod-ic passion which haunts the mind of Mr Roualeyn Gordon Cumming of Altyre.

We know that many gentlemen, who look with disgust upon the trade of a butcher, take excessive delight in stealing upon the solitude of a deer, and slaughtering him before he has time to fly; and we know that in India, and other foreign countries, there is nothing considered so exhilarating as one of those tiger hunts by which the tedium of intertropical life is occasionally broken. But to turn into a profession the stalking deer and combating beasts of prey—to abandon, for the sake of the indulgence, the comforts and decencies of civilised life, submitting to hunger and thirst, heat and

cold, and herding with savages and wild animals, and all for many years at a stretch—is surely the very sublime of eccentricity. Salmon-fishing and roe-stalking were the amusements of Mr Cumming's boyhood in the wilds of Morayshire. Then he joined his regiment in India, landing at the Cape to enjoy a bang at the smaller antelopes in the neighbourhood of Cape Town. After hunting for some time in India, he returned in bad health to stalk deer in the Scottish forests; but tiring of the tameness of the sport, he obtained a commission in the Royal Veteran Newfoundland Companies, looking upon it as a license to shoot in the hunting-grounds of the Far West. Disappointed in this view of his commission, he exchanged into the Cape Riflemen, and popped at quails for some time in the country of the Amapoonda Caffres. There was no man-shooting, however, to be had for love or money, the savages being villanously quiet; and he at length made up his mind to sell out of the army for good and all, and declare war on his own account against the wild beasts of the interior.

The expedition he fitted out on what the small sportsmen of this country would consider a princely scale, although he subsequently added greatly to its magnitude—having at one time three enormous wagons drawn by twelve oxen each, with a suitable number of native servants, horses, and provisions in proportion. His 'sinews of war' were neither money nor bank-notes, but goods of different kinds, such as cheap guns and beads, to barter with the natives; for Mr Cumming had an eye to the main chance as well as to sporting and natural history, and was determined to bring home not only a cabinet of prepared specimens, but a cargo of elephants' tusks. All being ready, he set forth into the wilderness, and startled the wild clans with the apparition of a hunter such as they had never seen, and probably never will see again.

On went the wagons, tearing through forests, where the axe was frequently obliged to pioneer their way—over swamps and rocks, across hills and deserts—

* Thorough brake, thorough brier,
Thorough muck, thorough mire,
Thorough water, thorough fire!

At their head, with his rifle over his shoulder, was the master-hunter, a tall, stout man of fourteen stone, dressed in a Highland kilt and wide-awake hat, with a long beard hanging upon his breast, and his arms naked to the shoulder. Sometimes he met with a Boer as solitary as himself, encamped in the wild, in a small tent, and surrounded by his flocks and herds; but as the renown of his exploits spread abroad, he was himself followed by families of the Caffre tribes, to the number of from one to two hundred men. 'These men were often accompanied by their wives and families; and when an elephant, hippopotamus, or other large animal was slain, all hands repaired to the spot, when every inch of the animal was reduced to biltongue—namely, cut into long narrow strips, and hung in festoons upon poles, and dried in the sun; even the entrails were not left for the vultures and hyenas, and the very bones were chopped to pieces with their hatchets to obtain the marrow, with which they enriched their soup.'

Besides the Caffres, our adventurer provided liberally for the birds and beasts of prey which assembled to dispute with him the carcase of his quarry. The black and white carrion crows came first, and then the vultures; and warned by the voice of the latter, the jackals sneaked out of their holes from far and near, and all

* Five Years of a Hunter's Life in the Far Interior of South Africa, &c. By Roualeyn Gordon Cumming, Esq., of Altyre. 2 vols. London: Murray. 1850.

crowded round the feast. But the jackals occasionally made their appearance in better time, and actually assisted him to capture his prey. 'In the more distant hunting-lands of the interior it sometimes happens that the lion assists the sportsman in a similar manner with the larger animals; and though this may appear like a traveller's story, it is nevertheless true, and instances of the kind happened both to myself and to Mr Oswell of the Honourable East India Company's Service, a dashing sportsman, and one of the best hunters I ever met, who performed two hunting expeditions into the interior. Mr Oswell and a companion were one day galloping along the shady banks of the Limpopo, in full pursuit of a wounded buffalo, when they were suddenly joined by three lions, who seemed determined to dispute the chase with them. The buffalo held stoutly on, followed by the three lions, Oswell and his companion bringing up the rear. Very soon the lions sprang upon the mighty bull, and dragged him to the ground, when the most terrific scuffle ensued. Mr Oswell and friend then approached, and opened their fire upon the royal family; and as each ball struck the lions, they seemed to consider it was a poke from the horns of the buffalo, and redoubled their attentions to him. At length the sportsmen succeeded in bowling over two of the lions, upon which the third, finding the ground too hot for him, made off.'

The native followers, too, assisted sometimes in the chase which fed them; but they sponged without shame upon other hunters of the wilderness, such as the wild dogs. These animals hunt the antelope in packs, the evolutions of which appear to be regulated by what might seem a kind of language, so different are the tones in which their various calls are made. They are unable to crack the larger bones of the prey; and when the natives have the good fortune to be beforehand with the hyenas (which do not come out before sunset) in finding the remains of their meal, they seize greedily upon the marrow-bones, and devour their contents raw. There is another denizen of the wild who depends upon the prowess of his neighbours, being unable to do anything himself but point the way to the prize. This is the honey-bird. 'This extraordinary little bird, which is about the size of a chaffinch, and of a light-gray colour, will invariably lead a person following it to a wild-bees' nest. Chattering and twittering in a state of great excitement, it perches on a branch beside the traveller, endeavouring by various wiles to attract his attention; and having succeeded in doing so, it flies lightly forward in a wavy course in the direction of the bees' nest, alighting every now and then, and looking back to ascertain if the traveller is following it, all the time keeping up an incessant twitter. When at length it arrives at the hollow tree, or deserted white ants' hill, which contains the honey, it for a moment hovers over the nest, pointing to it with its bill, and then takes up its position on a neighbouring branch, anxiously awaiting its share of the spoil.' The honey-bird, however, is not to be trusted without caution; for sometimes—through misconception, it is to be charitably supposed—instead of leading to a deposit of honey, it lands the unwary pursuer in the mid-day retreat of a lion, or the den of a crouching panther. Our author once followed this equivocal ally to the banks of a river, and to his great surprise found that his introduction was to be to an enormous crocodile.

The adventurer's first shot of any consequence was at a springbok—a species of antelope so called from the extraordinary bounds it takes into the air when pursued. 'They bound to the height of ten or twelve feet with the elasticity of an India-rubber ball, clearing at each spring from twelve to fifteen feet of ground, without apparently the slightest exertion. In performing the spring, they appear for an instant as if suspended in the air, when down come all four feet again together, and striking the plain, away they soar again, as if about to take flight.' These animals in their migrations are

compared to swarms of locusts. 'I beheld the ground to the northward of my camp actually covered with a dense living mass of springboks, marching slowly and steadily along, extending from an opening in a long range of hills on the west, through which they continued pouring, like the flood of some great river, to a ridge about a mile to the north-east, over which they disappeared. The breadth of the ground they covered might have been somewhere about half a mile. I stood upon the fore chest of my wagon for nearly two hours, lost in wonder at the novel and wonderful scene which was passing before me, and had some difficulty in convincing myself that it was reality which I beheld, and not the wild and exaggerated picture of a hunter's dream. During this time their vast legions continued streaming through the neck in the hills in one unbroken compact phalanx. At length I saddled up, and rode into the middle of them with my rifle and after-riders, and fired into the ranks until fourteen had fallen, when I cried "enough!" On another occasion 'some hundreds of thousands of springboks were within his vision' on a single plain; but an old Boer told him that the sight was nothing to what he had seen. "You this morning," he remarked, "behold only one flat covered with springboks, but I give you my word that I have ridden a long day's journey over a succession of flats covered with them, as far as I could see, as thick as sheep standing in a fold."

The oryx, or gemsbok, a much rarer antelope, attracted our author's special admiration. It has the erect mane, long, sweeping, black tail, and general appearance of the horse, with the head and hoofs of an antelope; but the grand peculiarity of the animal is its entire independence of water, which Mr Cumming believes it never tastes. Well would it have been for the hunter if he too had been destitute of the sense of thirst! In his chase of the interesting prey, he lost himself in the wilderness, and suffered frightfully from the want of water. Night came on, and he lay down in the open plain to sleep, with no other clothes on his person than a shirt and a pair of knee-breeches. Shivering with cold, and almost frantic with thirst, he thus lay in the howling waste till morning. The marauding Bushmen depend for safety in the aridity of the deserts they have to cross on their forays upon the Boers and Caffres. The drier the season is, the more energetic are these pedestrian warriors, each of whom conceals for his own use, at regular intervals along the track, a supply of water in ostrich eggs; and knowing that he can only be pursued on horseback, feels secure in the inability of such animals to do without the like refreshment. The Bushmen, too, in driving away a spoil of cattle, travel night as well as day, while their mounted enemies lose the track if they advance after the sun goes down.

The ostrich, whose eggs are thus turned to so important a use, becomes itself the certain prey of the Bushman, if he has only the good-fortune to stumble upon its nest; for he ensconces himself within the ample precincts, and awaits patiently the return of the unconscious proprietor. At other times he clothes himself in the skin of one of these birds, and stalks about the plain like one of themselves, till he is near enough for a poisoned arrow to do its work.

Another species of antelope, a wildebeest, exhibited an extraordinary instance of public virtue when our adventurer, concealed near a pond, was on the watch for a shot at its friends. This was an old-gentleman wildebeest, who, chancing to discover the retreat of the hunter, established himself as sentry over him, keeping just beyond rifle-range, and driving away each troop of his fellows as they advanced to drink. But at length there approached a bevy of lady wildebeests, who, with the heedlessness of their sex, only tossed their pretty heads at the warning of the Mentor, and came bounding on. The old gentleman was desperate. He entirely forgot the prudential rule he had laid down for himself; and coming within range, he received from the vindictive hunter a shot which made him dart off at full speed,

and leave the dangerous and endangered sex to their fate.

On another occasion Mr Cumming fell asleep in his lair, after having discharged both barrels of his rifle, and was awakened by a dream of lions. 'I awoke with a sudden start, uttering a loud shriek. I could not for several seconds remember in what part of the world I was, or anything connected with my present position. I heard the rushing of light feet, as of a pack of wolves, close on every side of me, accompanied by the most unearthly sounds. On raising my head, to my utter horror I saw on every side nothing but savage wild dogs, chattering and growling. On my right and on my left, and within a few paces of me, stood two lines of these ferocious-looking animals, cocking their ears and stretching their necks to have a look at me; while two large troops, in which there were at least forty of them, kept dashing backwards and forwards across my wind within a few yards of me, chattering and growling with the most extraordinary volubility. Another troop of wild dogs were fighting over the wildebeest I had shot, which they had begun to devour. On beholding them, I expected no other fate than to be instantly torn to pieces and consumed. I felt my blood curdling along my cheeks, and my hair bristling on my head. However, I had presence of mind to consider that the human voice and a determined bearing might overawe them; and accordingly, springing to my feet, I stepped on to the little ledge surrounding the hole, where, drawing myself up to my full height, I waved my large blanket with both hands, at the same time addressing my savage assembly in a loud and solemn manner. This had the desired effect: the wild dogs removed to a more respectful distance, barking at me something like collies. Upon this I snatched up my rifle, and commenced loading, and before this was accomplished, the entire pack had passed away, and did not return.'

This conclusion, however, does not satisfy the reader's sense of justice, for ambush-fighting is never respectable. Our author, however, is of opinion that animals are made to be torn to pieces. In describing the horrible suffering of a noble gnou, which was destroyed by wild dogs, he says pathetically, 'Poor old bull! I could not help commiserating his fate. It is melancholy to reflect that, in accordance with the laws of nature, such scenes of pain must ever be occurring; one species, whether inhabiting earth, air, or ocean, being produced to become the prey of another. At night I watched the water, with fairish moonlight, and shot a large spotted hyena.' On another occasion he succeeded in slaughtering a fine white female rhinoceros, which reeled with the last shot, spouting torrents of blood from her mouth and wounds, and screaming as she died. One can scarcely imagine a human being feeling pleasure in such a sight as this; but we must make some allowance for those who go so far beyond the sound of Sabbath bells, and enter into such wild warfare. When Mr Cumming saw groups of vultures gathering over another part of the forest, and knew that it was for the obsequies of an eland—the most magnificent of the antelope tribe, larger than an ox—which he had mortally wounded in the morning, while tears trickled from the creature's large dark eyes, his satisfaction appears to have been at its height. 'That night I slept beneath the blue and starry canopy of heaven. My sleep was light and sweet, and no rude dreams or hankering cares disturbed the equanimity of my repose!'

The rhinoceros above-mentioned, unfortunately for her, was unattended by her guardian angel—the rhinoceros-bird. This little creature warns the huge animal of the approach of enemies, by uttering in his ear a harsh grating cry. 'I have often hunted a rhinoceros on horseback, which led me a chase of many miles, and required a number of shots before he fell, during which chase several of these birds remained by the rhinoceros to the last. They reminded me of mariners on the deck of some bark sailing on the ocean, for they perched along his back and sides; and as each of my bullets told on

the shoulder of the rhinoceros, they ascended about six feet into the air, uttering their harsh cry of alarm, and then resumed their position. It sometimes happened that the lower branches of trees, under which the rhinoceros passed, swept them from their living deck, but they always recovered their former station; they also adhere to the rhinoceros during the night. I have often shot these animals at midnight when drinking at the fountains, and the birds, imagining they were asleep, remained with them till morning, and on my approaching, before taking flight, they exerted themselves to their utmost to awaken Chukuroo from his deep sleep.' The source of their interest in the rhinoceros is in the ticks and other insects that swarm upon his skin.

Another huge mammal, the hippopotamus, appears, from our author's account, to be pretty nearly as harmless and respectable an animal in his native rivers as the individual in Regent Park. He attacked three at once, and after wounding the one he selected, a female, dashed into the waters after her up to the armpits. But the slaughter of the poor helpless brute is too disgusting a story for our readers, and is one of the numerous instances of bad taste afforded by the book. This was a huge creature, five feet broad across the belly. The only difficulty in this kind of sporting arose from the enormous weight of the animals. The river in one portion of the route seemed to be alive with the unwieldy creatures, wallowing in the water in droves of twenty or thirty at a time. The crocodile appears to live on good terms with his scarcely less amphibious neighbours; and our author was astonished at the great size of the former, one individual appearing to be 16 or 18 feet long, with a body as thick as an ox. 'The next minute, one of them popping up his terrible head in the middle of the stream, I made a beautiful shot, and sent a ball through the middle of his brains. At first he sank for an instant to the shot, but instantly striking the bottom with his tail, he shot up above the water, when he struggled violently, sometimes on his back, and then again on his belly, with at one time his head and fore-feet above the water, and immediately after his tail and hind-legs, the former lashing the water with a force truly astounding. Clouds of sand accompanied him in all his movements, the strong stream carrying him along with it, till at length the struggle of death was over, and he sank to rise no more.'

An adventure with a snake—for nothing came amiss to our hunter—is illustrated by an engraving, in which his Caffre servant is seen with the creature's tail over his shoulder, and Mr Cumming grasping its body, and with his foot against a rock for purchase, as they are endeavouring to drag their prey from the hole in which he has taken refuge. The serpent is 14 feet long, and proportionably thick, and both men are unarmed. When they succeed in extricating him, he 'springs at them like an arrow,' and 'snaps with his horrid fangs' within a foot of the hunters' naked legs; but Mr Cumming merely slips out of his way, and picking up a green bough, belabours him with it till he at length kills him. St George's adventure with the dragon was nothing to this, either as regards the fearlessness of the knight or the marvellousness of the event.

The camelopard is another of our author's familiar acquaintances, and we are glad to turn to him from such strange bedfellows as snakes and crocodiles. This gigantic animal is usually found in herds of sixteen, although Mr Cumming sometimes saw thirty, and even forty, in one company. 'These herds are composed of giraffes of various sizes, from the young giraffe of 9 or 10 feet in height, to the dark chestnut-coloured old bull of the herd, whose exalted head towers above his companions, generally attaining to a height of upwards of 18 feet. The females are of lower stature, and more delicately formed, than the males, their height averaging from 16 to 17 feet. Some writers have discovered ugliness and a want of grace in the giraffe, but I consider that he is one of the most strikingly-beautiful animals in the creation; and when a herd of them is

seen scattered through a grove of the picturesque parasol-topped acacias which adorn their native plains, and on whose uppermost shoots they are enabled to browse by the colossal height with which nature has so admirably endowed them, he must indeed be slow of conception who fails to discover both grace and dignity in all their movements.' The giraffe resembles much the trunk of a blasted tree. 'I have repeatedly been in doubt as to the presence of a troop of them, until I had recourse to my spyglass; and on referring the case to my savage attendants, I have known even their optics to fail, at one time mistaking these dilapidated trunks for camelopards, and again confounding real camelopards with these aged veterans of the forest.' In his first encounter with these noble animals he rode into the herd, and shot repeatedly at the one he selected, confronting her, bringing her to a stand, and firing within a few yards' distance. Still she did not fall; and dismounting from his horse, 'while her soft dark eye, with its silky fringe, looked down imploringly at me,' he completed the murder with a bullet through her neck. The buffalo is an antagonist of another kidney. On one occasion, when hard hunted, 'he had recourse to a singular stratagem. Doubling round some thick bushes which obscured him from our view, he found himself beside a small pool of rain-water, just deep enough to cover his body; into this he walked, and, facing about, lay gently down, and awaited our oncoming, with nothing but his old gray face and massive horns above the water, and these concealed from view by rank overhanging herbage. Our attention was entirely engrossed with the spoor, and thus we rode boldly on until within a few feet of him, when, springing to his feet, he made a desperate charge after Ruyter, uttering a low stifled roar peculiar to buffaloes (somewhat similar to the growl of a lion), and hurled horse and rider to the earth with fearful violence.'

Elephant-hunting, it would appear from our adventurer's report, is by no means the dangerous service it is commonly supposed to be. 'The elephant entertains an extraordinary horror of man, and a child can put a hundred of them to flight by passing at a quarter of a mile to windward; and when thus disturbed, they go a long way before they halt. It is surprising how soon these sagacious animals are aware of the presence of a hunter in their domains. When one troop has been attacked, all the other elephants frequenting the district are aware of the fact within two or three days, when they all forsake it, and migrate to distant parts, leaving the hunter no alternative but to ispan his wagons, and remove to fresh ground.' When urged to departure, however, by the hunter, the animal is dangerous. Mr Cumming having wounded a female elephant, dismounted from his horse to try the effect of another shot at forty yards. His horse, however, had less presence of mind than his master. 'Colesberg was extremely afraid of the elephants, and gave me much trouble, jerking my arm when I tried to fire. At length I let fly; but on endeavouring to regain my saddle, Colesberg declined to allow me to mount; and when I tried to lead him, and run for it, he only backed towards the wounded elephant. At this moment I heard another elephant close behind, and on looking about, I beheld the "friend," with uplifted trunk, charging down upon me at top speed, shrilly trumpeting, and following an old black pointer named Schwartz, that was perfectly deaf, and trotted along before the enraged elephant, quite unaware of what was behind him. I felt certain that she would have either me or my horse. I, however, determined not to relinquish my steed, but to hold on by the bridle. My men, who of course kept at a safe distance, stood aghast with their mouths open, and for a few seconds my position was certainly not an enviable one. Fortunately, however, the dogs took off the attention of the elephants, and just as they were upon me, I managed to spring into the saddle, where I was safe. As I turned my back to mount, the elephants were so very near, that I really expected to feel one of their

trunks lay hold of me. I rode up to Kleinboy for my double-barrelled two-grooved rifle; he and Isaac were pale, and almost speechless with fright. Returning to the charge, I was soon once more alongside, and firing from the saddle, I sent another brace of bullets into the wounded elephant.' On horseback Mr Cumming never felt himself in the slightest danger. The elephant charged his enemy, but after a short run, saw that pursuit was hopeless, and as soon as he stopped, the hunter fired again. There is, in fact, much sameness in the accounts our author gives us of this kind of sport, and one is inclined to think that, after the first excitement is over, an elephant-hunt must be a slow affair.

The fat of the elephant is a great luxury to the Caffres. It 'lies in extensive layers and sheets in his inside, and the quantity which is obtained from a full-grown bull in high condition is very great. Before it can be obtained, the greater part of the bowels must be removed. To accomplish this, several men eventually enter the immense cavity of his inside, where they continue mining away with their assagais, and handing the fat to their comrades outside until all is bare.' But before this mining process 'the rough outer skin is first removed in large sheets from the side which lies uppermost. Several coats of an under skin are then met with. This skin is of a tough and pliant nature, and is used by the natives for making water-bags, in which they convey supplies of water from the nearest vley or fountain (which is often ten miles distant) to the elephant. They remove this inner skin with caution, taking care not to cut it with the assagai, and it is formed into water-bags by gathering the corners and edges, and transfixing the whole on a pointed wand. The flesh is then removed in enormous sheets from the ribs, when the hatchets come into play, with which they chop through and remove individually each colossal rib.' The flesh is cut into ribbons, and hung up in the sun for two or three days to dry into 'biltongue.'

The lion-fights are numerous, and one or two of them exciting. The hunter had followed a lioness until she at length turned to bay, and advanced upon her enemy. 'Now, then, for it, neck or nothing! She is within sixty yards of us, and she keeps advancing. We turned the horses' tails to her. I knelt on one side, and taking a steady aim at her breast, let fly. The ball cracked loudly on her tawny hide, and crippled her in the shoulder, upon which she charged with an appalling roar, and in the twinkling of an eye she was in the midst of us. At this moment Stofolus's rifle exploded in his hand, and Kleinboy, whom I had ordered to stand ready by me, danced about like a duck in a gale of wind. The lioness sprang upon Colesberg, and fearfully lacerated his ribs and haunches with her horrid teeth and claws. . . . When the lioness sprang on Colesberg, I stood out from the horses, ready with my second barrel for the first chance she should give me of a clear shot. This she quickly did; for, seemingly satisfied with the revenge she had now taken, she quitted Colesberg, and slewing her tail to one side, trotted sulkily past within a few paces of me, taking one step to the left. I pitched my rifle to my shoulder, and in another second the lioness was stretched on the plain a lifeless corpse.' This is a fair example of the lion stories; but on one occasion, when the adventurer was passing the night by the side of a fire made in the wood, one of his Hottentots, whose restingplace was at some little distance, was carried off and partly devoured by a lion. This is the only casualty of the kind mentioned in the book; and with so many encounters, the circumstance is not the least remarkable thing in it.

Upon the whole, there is not so much variety in these anecdotes of woodland warfare as might have been expected; but the book will doubtless enjoy a considerable currency among the Nimrods at home. Mr Cumming returned to this country with a large quantity of ivory, and many specimens of natural history, now exhibiting in London. Two or three months ago he visited Edinburgh, and thinking proper to parade our

streets in the costume he had worn in the desert, he was of course an object of considerable interest to the idle class of the inhabitants—and to the police.

ALIMENTARY REGIMEN.

A PAPER under the above title has recently been read before the French Academy of Sciences by M. de Gasparin, who presents it as the result of long and serious inquiry into the condition of the working population. The subject is one that cannot fail to be interesting wherever large masses of population have to be fed, and nowhere more so than in England. The author discusses the question of changing circumstances, and shows that people do not always live better as their money-condition improves: he instances the inhabitants of central France as a case in point; and there are districts in this country where the same would apply. He insists on the necessity for azotised food, and institutes comparisons of various dietaries. Throughout France the average proportion of azote in food may be taken as from 20 to 26 grammes—about $\frac{3}{4}$ of an ounce. He then continues:—‘A remarkable fact which I met with on our Belgian frontier, presents to us another mode of economy exercised upon regimen, even where the supply of alimentary substances is very small. The mining population of the environs of Charleroi have resolved this problem: to nourish themselves completely, preserve health, and great vigour of muscular strength, upon a diet with less than half of the nutritive principles of that indicated by observation in the rest of Europe.’ The distinctive fact appears to be the habitual use of coffee at every meal. ‘On rising in the morning, the workman makes what he calls his coffee: it is a very weak infusion of coffee and chicory mixed in about equal proportions. This drink, to which a tenth of milk is added, constitutes almost entirely the liquid part of the alimentation. Before going to work, the miner takes a good demi-litre (rather more than half pint) of this coffee, and eats a large slice of white bread with butter. He carries with him to the mine similar buttered slices, and a tin bottle, which holds at most a litre of coffee: this food is consumed by him during the day. In the evening, on going home, he eats potatoes dressed with cabbage or some other green vegetable, and finishes this repast with another slice of bread and butter and a cup of his coffee.

‘All the workmen examined during the inquiry state that they eat a loaf in two days. These loaves weigh about 4 lbs., which gives 2 lbs. per day. They eat meat only on Sundays and festival days, and on those days drink 2 litres of beer. Their bread is always white, and of good quality; but it is only a few privileged workmen who eat meat on other days of the week: the exception is very rare. The quantity of butter consumed may be reckoned at 2 ounces per day, and that of coffee and chicory at 1 ounce each also daily. The portion of potatoes and other vegetables cooked together and eaten in the evening is at most $1\frac{1}{2}$ lbs. During the week the workman drinks neither beer nor any other fermented liquor: coffee is his only beverage.’

After tabulating these quantities, M. de Gasparin continues:—‘It is thus to 15 grammes (about half an ounce) of azote instead of 23 that the albuminous substance which enters into the ration of the Belgian miners is reduced. This nourishment is still inferior to that of the most austere religious orders imposed by mortification. I have studied and analysed the diet of the monks of La Trappe at Aiguebelle. Their pale

complexion, slow walk, the unimportant mechanical labour to which they are subjected, and which the labourers of the country estimate at not a fifth of theirs, all show that their alimentation is at a minimum in the circumstances in which they are placed. Yet it contains 15 grammes of azote, and 402 grammes of carbon, or of hydrogen reduced to six equivalents of carbon.

‘The nutriment of these miners is inferior also to that of the prisoners in our central houses of detention, whose mechanical labour is almost *nil*, resolving itself into easy movements of the arms, which require more of attention and skill than of strength. Their daily diet contains more than 16 grammes of azote and 475 of carbon.

‘Now it must be added that the miner, whose diet is apparently as poor as we have described it, is a most energetic workman; that when French miners—those of Anzin for example, who nourish themselves much more abundantly—attempt to work in the Charleroi mines, they are soon compelled to withdraw, not being able to keep pace with the Belgian workman in the execution of his task.

‘It is to the coffee alone that we can attribute this possibility of contenting themselves with a diet which children would find insufficient; and it is not a question here of nutritious substance, for the analysis demonstrates that the coffee constitutes no more than 1-35th of the nutritious properties of the aliment. It has thus other properties of which careful account must be taken.

‘Does it complete the digestive function?—does it provoke a more complete assimilation of the aliments?—or perhaps it retards the mutation of those organs which do not then require so great a consumption of material for their maintenance or support? On this hypothesis coffee would not nourish, but it would prevent *denourishment*.’

M. de Gasparin then shows from certain tables that the waste in liquid excretion is less when coffee is drunk than at other times, a fact which to some extent supports his hypothesis. He instances the effects of coffee in enabling soldiers and others to endure fatigue, and continues:—‘An old foreman who knows the district well, and has been himself a labourer, informed me that a miner, with his wife and six children, lives on his daily earnings of two francs without making debts.

‘These researches may have important consequences in the condition of a population, and should engage the serious attention of chemists, physicians, and economists. If it were proved that, without injury to health, or to the development and maintenance of strength, the use of coffee admits of a man contenting himself with a diminished nutriment, we should be able to provide with less trouble against the deficit in times of scarcity, and to comprehend the importance of extending the use of this beverage without checking it by high duties.’

Such is the substance of M. de Gasparin's paper, which, though highly interesting, is not perhaps a complete resolution of the question. According to some of our chemists cabbage is eminently nutritive; and it is also true that dogs, fed on none but highly-azotised food, will die at the end of a month with all the symptoms of inanition. As M. Magendie observed when the subject came before the Académie, in feeding carnivora, it is necessary to give them as much of dried meat as they would require in its raw state: in the one case they get nine or ten times as much azote as in the other, with only the same nutritive result. As this learned *savant* stated, ‘everything which relates to the theory of nutrition is yet surrounded by an impenetrable veil. We know nothing or next to nothing upon this important and fundamental phenomenon. We are beginning to comprehend the different operations of digestion, but all that happens after the formation and absorption of the chyle, all that takes place in the

blood, and in the intimate connections of the fluids with the organic tissues, is still enveloped in the completest obscurity.'

Stories for Young People.

THE KITE.

THE setting sun beamed in golden light over the country; long shadows lay on the cool grass: the birds, which had been silent through the sultry heat of the day, sang their joyous evening hymn: the merry voices of the village children sounded through the clear air, while their fathers loitered about enjoying the luxury of rest after labour. A sun-burnt traveller with dusty shoes walked sturdily along the high road: he was young and strong, and his ruddy cheeks glowed in the warm light: he carried his baggage on a stick over his shoulder, and looked straight on towards the cottages of the village; and you might see by the expression of his face that his eye was earnestly watching for the first glimpse of the home that lay among them, to which he was returning.

The same setting sun threw his golden beams over the great metropolis: they lighted up streets, and squares, and parks whence crowds were retiring from business or pleasure to their various places of abode or gay parties: they pierced even through the smoke of the city, and gilded its great central dome; but when they reached the labyrinth of lanes and courts which it encloses, their radiance was gone, for noxious vapours rose there after the heat of the day, and quenched them. The summer sun is dreaded in those places.

The dusky light found its way with difficulty through a small and dim window into an upper room of a house in one of these lanes, and any one entering it would at first have thought it was void of any living inhabitant, had not the restless tossing and oppressed breathing that proceeded from a bed in one corner borne witness to the contrary. A weak, sickly boy lay there, his eye fixed on the door. It opened, and he started up in bed; but at the sight of another boy, a few years older than himself, who came in alone, he sunk back again, crying in a plaintive voice, 'Don't you see her coming yet?'

'No, she is not in sight: I ran to the corner of the lane, and could see nothing of her,' replied the elder boy, who, as he spoke, knelt down before the grate, and began to arrange some sticks in it.

Everything in the room bespoke poverty; yet there was an appearance of order, and as much cleanliness as can be attained in such an abode. Among the scanty articles of furniture there was one object that was remarkable as being singularly out of place, and apparently very useless there: it was a large paper kite, that hung from a nail on the wall, and nearly reached from the low ceiling to the floor.

'There's eight o'clock just struck, John,' said the little boy in bed. 'Go and look once more if mother's not coming yet.'

'It's no use looking, Jem. It won't make her come any faster; but I'll go to please you.'

'I hear some one on the stairs.'

'It's only Mrs Willis going into the back-room.'

'Oh dear, dear, what shall I do?'

'Don't cry, Jem. Look, now I've put the wood all ready to boil the kettle the minute mother comes, and she'll bring you some tea: she said she would. Now I'm going to sweep up the dust, and make it all tidy.'

Jem was quieted for a few minutes by looking at his brother's busy operations, carried on in a bustling, rattling way, to afford all the amusement possible; but the feverish restlessness soon returned.

'Take me up, do take me up,' he cried; 'and hold me near the broken pane, please, John;' and he stretched out his white, wasted hands.

John kindly lifted out the poor little fellow, and dragging a chair to the window, sat down with him on his knee, and held his face close to the broken pane, through which, however, no air seemed to come, and he soon began to cry again.

'What is it, Jem?—what's the matter?' said a kind voice at the door, where a woman stood, holding by the hand a pale child.

'I want mother,' sobbed Jem.

'Mother's out at work, Mrs Willis,' said John; 'and she thought she should be home at half-past seven; but she's kept later sometimes.'

'Don't cry,' said Mrs Willis's little girl, coming forward. 'Here's my orange for you.'

Jem took it, and put it to his mouth; but he stopped, and asked John to cut it in two; gave back half to the little girl, made John taste the portion he kept, and then began to suck the cooling fruit with great pleasure, only pausing to say with a smile, 'Thank you, Mary.'

'Now lie down again, and try to go to sleep; there's a good boy,' said Mrs Willis; 'and mother will soon be here. I must go now.'

Jem was laid in bed once more; but he tossed about restlessly, and the sad wail began again.

'I'll tell you what,' said John, 'if you will stop crying, I'll take down poor Harry's kite, and show you how he used to fly it.'

'But mother don't like us to touch it.'

'No; but she will not mind when I tell her why I did it this once. Look at the pretty blue and red figures on it. Harry made it, and painted it all himself; and look at the long tail!'

'But how did he fly it? Can't you show me how poor Harry used to fly it?'

John mounted on a chest, and holding the kite at arm's length, began to wave it about, and to make the tail shake, while Jem sat up admiring.

'This was the way he used to hold it up. Then he took the string that was fastened here—mother has got it in the chest—and he held the string in his hand, and when the wind came, and sent the kite up, he let the string run through his hand, and up it went over the trees, up—up—and he ran along in the fields, and it flew along under the blue sky.'

John waved the kite more energetically as he described, and both the boys were so engrossed by it, that they did not observe that the mother, so longed for, had come in, and had sunk down on a chair near the door, her face bent and nearly hidden by the rusty crape on her widow's bonnet, while the tears fell fast on her faded black gown. 'Oh mother, mother!' cried Jem, who saw her first, 'come and take me—come and comfort me!'

The poor woman rose quickly, wiped her eyes, and hastened to her sick child, who was soon nestled in her arms, and seemed to have there forgotten all his woes.

The kind, good-natured John had meanwhile hung up the kite in its place, and was looking rather anxiously at his mother, for he well understood the cause of the grief that had overcome her at the sight of his occupation when she first came in; but she stroked his hair, looked kindly at him, and bid him make the kettle boil, and get the things out of her basket. All that was wanted for their simple supper was in it, and it was not long before little Jem was again laid down after the refreshment of tea; then a mattress was put in a corner for John, who was soon asleep; and the mother, tired with her day's hard work, took her place in the bed by the side of her child.

But the tears that had rolled fast down her cheeks as her lips moved in prayer before sleep came upon her, still made their way beneath the closed eyelids, and Jem awoke her by saying, as he stroked her face with his hot hand, 'Don't cry, mother; we won't touch it again!'

'It's not that, my child; no, no: it's the thought of my own Harry. I think I see his pleasant face, and his curly hair, and his merry eyes looking up after his kite.' It was not often she spoke out her griefs; but now, in the silent night, it seemed to comfort her.

'Tell me about him, mother, and about his going away! I like to hear you tell about him.'

'He worked with father, you know, and a clever workman he learned to be.'

'But he was much older than me. Shall I ever be a good workman, mother?'

The question made her heart ache with a fresh anguish, and she could not answer it; but replied to his first words, 'Yes, he was much older. We laid three of our children in the grave between him and John. Harry was seventeen when his uncle took him to serve out his time in a merchant-ship. Uncle Ben, that was ship's carpenter, it was that took him. The voyage was to last a year and a-half, for they were to go to all manner of countries far, far away. One letter I had. It came on a sad day: the day after poor father died, Jem. And then I had to leave our cottage in our own village, and bring you two to London, to find work to keep you; but I have always taken care to leave word where I was to be found, and have often gone to ask after letters. Not one has ever come again; and it's six months past the time when they looked for the ship, and they don't know what to think. But I know what I think: the sea has rolled over my dear boy, and I shall never see him again—never, never in this weary world.'

'Don't cry so, mother dear: I'll try to go to sleep, and not make you talk.'

'Yes—try; and if you can only get better, that will comfort me most.'

Both closed their eyes, and sleep came upon them once more.

It was eight o'clock in the morning when the little boy awoke, and then he was alone; but to that he was accustomed. His mother was again gone to work, and John was out cleaning knives and shoes in the neighbourhood. The table, with a small piece of bread and a cup of blue milk and water on it, stood beside him. He drank a little, but could not eat, and then lay down again with his eyes fixed on Harry's kite.

'Could he fly it,' or rather 'could he see John fly it—really out of doors and in the air?' That was of all things what he most longed to do. He wondered where the fields were, and if he could ever go there and see the kite fly under the blue sky. Then he wondered if John could fly it in the lane. He crept out of bed, and tottered to the window.

The lane was very wet and slushy, and a nasty black gutter ran down it, and oozed out among the broken stones. There had been a heavy thunder-shower in the night; and as there was no foot pavement, and what stones there were were very uneven and scattered, the black pools lodged among them, and altogether it seemed impossible for a boy to fly a kite there; for 'how could he run along holding the string!—he would tumble among the dirty pools. There were only four children to be seen in it now, out of all the numbers that lived in the houses, though it was a warm summer morning, and they were dabbling with naked feet in the mud, and their ragged clothes were all dragged. Mother would never let him and John do like that.'

Still he stood, first examining the window, then looking at the kite; then putting his hand out through the broken pane, and pondered over a scheme that had entered his mind.

'John,' he cried, as the door opened, 'don't you think we could fly Harry's kite out of the broken pane!'

At first this idea seemed to John perfectly chimerical; but after some consultation and explanation a plan was devised between the two boys, to complete which they only waited for their mother's return. They expected her at one, for this was only half a day's work.

Jem was dressed when she returned, and his excitement made him appear better; but she saw with grief that he could not touch his dinner; and her anxiety about him made her less unwillingly, than she otherwise would have done, consent to the petition he made, that 'only for this once she would let him and John fly the kite outside the window.' She stifled her sigh as she sat down to needlework, lest she should cast a gloom over the busy preparations that immediately commenced.

The difficulty had been how to get the kite out, because

the window would not open. To surmount this, John was to go down to the lane, taking the kite with him, while Jem lowered the string out of the broken pane.

'When you get hold of the string, you know, John, you can fasten it, and then stand on that large stone opposite, just by where that gentleman is, and hold up the kite, and then I will pull.'

All was done accordingly. John did his part well. Jem pulled; the kite rose to the window, and fluttered about, for the thunder had been followed by a high wind, which was felt a little even in this close place, and the boys gazed at it with great pleasure. As it dangled loosely by the window in this manner, the tail became entangled, and John was obliged to run up to help to put it right.

'Let it down to me again when I have run out,' said he, as he tried to disentangle it; 'and I will stand on the stone, and hold it up, and you can pull again. There's the gentleman still, and now there's a young man besides. The gentleman has made him look up at the kite.'

'Come and look, mother,' said Jem: but she did not hear. 'The young man has such a brown face, and such curly hair.'

'And he's like— Mother, he is crossing over!' cried John. 'He has come into the house!'

The mother heard now. A wild hope rushed through her heart; she started up; a quick step was heard on the stairs; the door flew open; and the next moment she was clasped in her son's arms!

The joy nearly took away her senses. Broken words mingled with tears, thanksgivings, and blessings, were all that were uttered for some time between them. Harry had Jem on his knee, and John pressed close to his side, and was holding his mother tight by the hand, and looking up in her face, when at last they began to believe and understand that they once more saw each other. And then he had to explain how the ship had been disabled by a storm in the South Seas; and how they got her into one of the beautiful islands there, and refitted her, and after six months' delay, brought her back safe and sound, cargo and all; and how he and Uncle Ben were both strong and hearty.

'How well you look, my dear boy!' said the happy mother. 'How tall, and stout, and handsome you are!'

'And he's got his curly hair and bright eyes still,' said poor wan little Jem, speaking for the first time.

'But you, mother, and all of you, how pale you are, and how thin! I know—yes, don't say it—I know who's gone. I went home last night, mother. I walked all the way to the village, and found the poor cottage empty, and heard how he died.'

'Home! You went there?'

'Yes, and the neighbours told me you were gone to London. But I slept all night in the kitchen on some straw. There I lay, and thought of you, and of him we had lost, and prayed that I might be a comfort to you yet.'

Joy and sorrow seemed struggling for the mastery in the widow's heart; but the present happiness proved the stronger, and she was soon smiling, and listening to Harry.

'I had a hard matter to find you,' he said. 'You had left the lodging they directed me to at first.'

'But I left word where I had come to.'

'Ay, so you had; and an old woman there told me you were at No. 10, Paradise Row.'

'What could she be thinking of!'

'No one had heard of you in that place. However, as I was going along back again to get better information, keeping a sharp look-out in hopes I might meet you, I passed the end of this lane, and saw it was called Eden Lane, so I thought perhaps the old lady had fancied Paradise and Eden were all the same; and sure enough they are both as like one as the other, for they are wretched, miserable places as ever I saw. I turned in here, and then No. 10 proved wrong too; and as I was standing looking about, and wondering what I had better do next, a gentleman touched my arm, and pointing first

at the black pools in the broken pavement, and then up at this window, he said—I remember his very words, they struck me so—"Do not the very stones rise up in judgment against us! Look at those poor little fellows trying to fly their kite out of a broken pane!" Hearing him say so, I looked up, and saw my old kite—by it I found you at last."

They all turned gratefully towards it, and saw that it still swung outside, held there safely by its entangled tail. The talk, therefore, went on uninterruptedly. Many questions were asked and answered, and many subjects discussed; the sad state of poor little Jem being the most pressing. At the end of an hour a great bustle was going on in the room: they were packing up all their small stock of goods, for Harry had succeeded, after some argument, in persuading his mother to leave her unhealthy lodging that very evening, and not to risk even one more night for poor Jem in that poisonous air. He smoothed every difficulty. Mrs Willis gladly undertook to do the work she had engaged to do; and with her he deposited money for the rent, and the key of the room. He declared he had another place ready to take his mother to; and to her anxious look he replied, 'I did good service in the ship, and the owners have been generous to us all. I've got forty pounds.'

'Forty pounds!' If he had said, 'I have got possession of a gold district in California,' he would not have created a greater sensation. It seemed an inexhaustible amount of wealth.

A light cart was soon hired and packed, and easily held not only the goods (not forgetting the kite), but the living possessors of them; and they set forth on their way.

The evening sun again beamed over the country; and the tall trees, as they threw their shadow across the grass, waved a blessing on the family that passed beneath, from whose hearts a silent thanksgiving went up that harmonised with the joyous hymn of the birds. The sun-burnt traveller, as he walked at the horse's head, holding his elder brother's hand, no longer looked anxiously onward, for he knew where he was going, and saw by him his younger brother already beginning to revive in the fresh air, and rejoiced in his mother's expression of content and happiness. She had divined for some time to what home she was going.

'But how did you contrive to get it fixed so quickly, my kind, good boy!' she said.

'I went to the landlord, and he agreed at once: and do not be afraid, I can earn plenty for us all.'

'But must you go to sea again!'

'If I must, do not fear. Did you not always teach me that His hand would keep me, and hold me, even in the uttermost parts of the sea!'

And she felt that there was no room for fear.

A week after this time, the evening sun again lighted up a happy party. Harry and John were busied in preparing the kite for flying in a green field behind their cottage. Under the hedge, on an old tree trunk, sat their mother, no longer in faded black and rusty crape, but neatly dressed in a fresh, clean gown and cap, and with a face bright with hope and pleasure. By her was Jem, with cheeks already filling out, a tinge of colour in them, and eyes full of delight. On her other side was little Mary Willis. She had just arrived, and was telling them how, the very day after they left, some workmen came and put down a nice pavement on each side of the lane, and laid a pipe underground instead of the gutter; and that now it was as dry and clean as could be; and all the children could play there, and there were such numbers of games going on; and they all said it was the best thing they had had done for them for many a day; and so did their mothers too, for now the children were not all crowded into their rooms all day long, but could play out of doors.

'Depend upon it,' said Harry, 'it is that gentleman's doing that spoke to me of it the day I came first. This good old kite has done good service, and now it shall be rewarded by sailing up to a splendid height.'

As he spoke, he held it up, the light breeze caught it,

and it soared away over their heads under the blue sky; while the happy faces that watched it bore witness to the truth of his words—that 'the good old kite had done good service.'

ANECDOTE OF A SINGER.

SIGNORA GRASSINI, the great Italian singer, died a few months since at Milan. She was distinguished not only for her musical talents, but also for her beauty and powers of theatrical expression. One evening in 1810, she and Signor Crescentini performed together at the Tuileries, and sang in 'Romeo and Juliet.' At the admirable scene in the third act, the Emperor Napoleon applauded vociferously, and Talma, the great tragedian, who was among the audience, wept with emotion. After the performance was ended, the Emperor conferred the decoration of a high order on Crescentini, and sent Grassini a scrap of paper, on which was written, 'Good for 20,000 livres.—NAPOLEON.'

'Twenty thousand francs!' said one of her friends—'the sum is a large one.'

'It will serve as a dowry for one of my little nieces,' replied Grassini quietly.

Indeed few persons were ever more generous, tender, and considerate towards their family than this great singer.

Many years afterwards, when the Empire had crumbled into dust, carrying with it in its fall, among other things, the rich pension of Signora Grassini, she happened to be at Bologna. There another of her nieces was for the first time presented to her, with a request that she would do something for her young relative. The little girl was extremely pretty, but not, her friends thought, fitted for the stage, as her voice was a feeble contralto. Her aunt asked her to sing; and when the timid voice had sounded a few notes, 'Dear child,' said Grassini, embracing her, 'you will not want me to assist you. Those who called your voice a contralto were ignorant of music. You have one of the finest sopranos in the world, and will far excel me as a singer. Take courage, and work hard, my love: your throat will win a shower of gold.' The young girl did not disappoint her aunt's prediction. She still lives, and her name is Giulia Grisi.

A LIVING SUSPENSION BRIDGE.

'They are coming towards the bridge; they will most likely cross by the rocks yonder,' observed Raoul. 'How!—swim it?' I asked. 'It is a torrent there.' 'Oh, no,' answered the Frenchman; 'monkeys would rather go into fire than water. If they cannot leap the stream, they will bridge it.' 'Bridge it! and how?' 'Stop a moment, captain, you shall see.' The half-human voices now sounded nearer, and we could perceive that the animals were approaching the spot where we lay. Presently they appeared upon the opposite bank, headed by an old gray chieftain, and officered like so many soldiers. They were, as Raoul had stated, of the *comadrejas*, or ring-tailed tribe. One—an aide-de-camp, or chief pioneer, perhaps—ran out upon a projecting rock, and after looking across the stream, as if calculating the distance, scampered back, and appeared to communicate with the leader. This produced a movement in the troop. Commands were issued, and fatigue-parties were detached, and marched to the front. Meanwhile several of the *comadrejas*—engineers no doubt—ran along the bank, examining the trees on both sides of the *arroyo*. At length they all collected round a tall cottonwood that grew over the narrowest part of the stream, and twenty or thirty of them scampered up its trunk. On reaching a high point, the foremost—a strong fellow—ran out upon a limb, and taking several turns of his tail around it, slipped off, and hung head downwards. The next on the limb, also a stout one, climbed down the body of the first, and whipping his tail tightly round the neck and fore-arm of the latter, dropped off in his turn, and hung head down. The third repeated this manoeuvre upon the second, and the fourth upon the third, and so on, until the last upon the string rested his fore-paws upon the ground. The living chain now commenced swinging backwards and

forwards, like the pendulum of a clock. The motion was slight at first, but gradually increased, the lowermost monkey striking his hands violently on the earth as he passed the tangent of the oscillating curve. Several others upon the limbs above aided the movement. This continued until the monkey at the end of the chain was thrown among the branches of a tree on the opposite bank. Here, after two or three vibrations, he clutched a limb, and held fast. This movement was executed adroitly, just at the culminating point of the oscillation, in order to save the intermediate links from the violence of a too sudden jerk! The chain was now fast at both ends, forming a complete suspension bridge, over which the whole troop, to the number of four or five hundred, passed with the rapidity of thought. It was one of the most comical sights I ever beheld to witness the quizzical expression of countenances along that living chain! The troop was now on the other side, but how were the animals forming the bridge to get themselves over? This was the question which suggested itself. Manifestly by number one letting go his tail. But then the *point d'appui* on the other side was much lower down, and number one, with half-a-dozen of his neighbours, would be dashed against the opposite bank, or soused into the water. Here, then, was a problem, and we waited with some curiosity for its solution. It was soon solved. A monkey was now seen attaching his tail to the lowest on the bridge, another girdled him in a similar manner, and another, and so on, until a dozen more were added to the string. These last were all powerful fellows; and running up to a high limb, they lifted the bridge into a position almost horizontal. Then a scream from the last monkey of the new formation warned the tail end that all was ready; and the next moment the whole chain was swung over, and landed safely on the opposite bank. The lowermost links now dropped off like a melting candle, whilst the higher ones leaped to the branches, and came down by the trunk. The whole troop then scampered off into the chapperal, and disappeared!—*Captain Reil's Adventures in Southern Mexico.*

LONG-SUSPENDED VITALITY.

Mr Baird of the British Museum contributes the following extraordinary instance of long-suspended vitality to the July number of the 'Annals of Natural History.'—In March 1846 a series of shells was presented to the museum by Charles Lamb, Esq., collected by him previously in Egypt, Greece, &c. Amongst these were two specimens from Egypt of the *Helix maculosa*, "the snail of the desert," as it is generally called, and which is found in great abundance living on the dry and arid deserts of Egypt and Syria. On the 25th of March 1846 the two specimens were fixed upon tablets, and placed in the collection amongst the other mollusca. There they remained, summer and winter, fast fixed and gummed down upon the tablet, and immured in their prison till March 1850, four entire years after they had been first placed there, and without the slightest suspicion having been awakened that one of them contained a living inhabitant. How long they had been in the possession of Mr Lamb before he presented them to the museum I do not know. About the 15th of March 1850, having occasion to examine some shells in the same case as that in which these two helices were contained, I observed that in one of them a thin glassy-looking covering, the *epiphragm*, had spread over its mouth, and with evident signs that it was but recently formed. Rather surprised at this appearance, I removed the two specimens from the tablet, and placed them in tepid water. After the lapse of ten minutes, I had the pleasure of seeing the animal of one of the specimens begin to gradually come forth, and in a few minutes more walk along the surface of the basin in which it was placed. I immediately upon that removed it from the water, and placed it in a tumbler, where it began to crawl up its side. Next day I supplied it with a small portion of cabbage-leaf, of which it partook readily, though in small quantity. The animal in the other shell was found to be dead. It is not the least curious part of the story that the shell of the living animal was an injured shell, and had been repaired by the animal before it was collected by Mr Lamb, though it evidently had not time to perfect the mouth. It is still alive, and feeds readily, preferring cabbage-leaf to lettuce or any other kind of food I have yet tried. It is now (24th June 1850) engaged in the process of completing the mouth of its shell, having since March made a small addition to its growth.

EVENING GUESTS.

It is in the silence of this lonely eve,
With the street-lamp pale-flickering on the wall,
A spirit were to say to me—'Believe,
Thou shalt be answered. Call!'—Whom should I call?

And then I were to see thee gliding in
With thy pale robes (that in long-empty fold
Lie in my keeping)—and my fingers, thin
As thine were once—to feel in thy safe hold;
I should fall weeping on thy neck, and say
'I have so suffered since—since'— But the tears
Would cease, remembering how they count thy day,
A day that is with God a thousand years.

Then, what are these sad weeks, months, years of mine
To thine all-measureless infinitude?
What my whole life, when myriad lives divine
May rise, each leading to a higher good?

I lose myself—I faint. Beloved—best!
Sit in thy olden, dear humanity
A little while, my head upon thy breast,
And then I will go back to Heaven with thee.

Should I call Thee?—Ah no, I would not call!
But if, by some invisible angel led,
Thy foot were at the door, thy face, voice—all
Entering—Oh joy! Oh life unto the dead!

Then I, pale-smiling with a deep content,
Would give to thee the welcome long unknown;
And 'stead of those kind accents daily sent
To cheer me, I should hear thine own—thine own!

Thou too, like the beloved guest late gone,
Wouldst sit and clasp my feeble hand in thine;
'T would grieve thee to know why it grew so wan,
Therefore I would smile on, and give no sign.

And thou, soft-speaking in the olden voice,
Perchance with a compassionate tremble stirred,
Wouldst change this anguished doubt to full rejoice,
And heal my soul with each balm-dropping word.

So—talking of things meet for such as we—
Affection, strong as life, solemn as death,
Serene as that divine eternity
Where I shall meet thee, who wert my soul's breath—

Upon this crowned eve of many eves
Thou know'st—a third of life and all its lore
Would climax like a breaking wave. Who grieves
Though it should break, and cease for evermore?

HABITS.

Habit uniformly and constantly strengthens all our active exertions; whatever we do often, we become more and more apt to do. A snuff-taker begins with a pinch of snuff per day, and ends with a pound or two every month. Swearing begins in anger; it ends by mingling itself with ordinary conversation. Such-like instances are of too common notoriety to need that they be adduced; but, as I before observed, at the very time that the tendency to do the thing is every day increasing, the pleasure resulting from it is, by the blunted sensibility of the bodily organ, diminished; and the desire is irresistible, though the gratification is nothing. There is rather an entertaining example of this in Fielding's 'Life of Jonathan Wild,' in that scene where he is represented as playing at cards with the Count, a professed gambler. 'Such,' says Mr Fielding, 'was the power of habit over the minds of these illustrious persons, that Mr Wild could not keep his hands out of the Count's pockets, though he knew they were empty; nor could the Count abstain from palming a card, though he was well aware that Mr Wild had no money to pay him.'—*Sydney Smith's Moral Philosophy.*

PRICE 1½d.

THE EVERY-DAY YOUNG LADY.

THE every-day young lady is neither tall nor short, neither fat nor lean. Her complexion is not fair, but clear, and her colour not bright, but healthy. She is not vulgarly well, but has not the least illness in the world. Her face is oval, and her hair, moderate in quantity, is usually of a soft brown. Her features are small and unobtrusive: her nose being what the French passports call *moyen*—that is, neither one thing nor t'other—and her eyes as gray as glass, but clear and gentle. It is not the eyes that give her any little character she has; although, if you have nothing else to do, and happen to look at them for a minute or so, they win upon you. They are not varnished eyes, in which you can see nothing but the brightness; and not deep eyes, into which your soul plunges as into a gulf: they are mere common skylights, winning into them a little bit of heaven, and giving you an inkling of good temper and feminine gentleness. Neither is it her air, nor manner, nor dress, that stamps her individuality, if she has any, for these belong to the class of society in which she moves; but altogether she gives you an idea of young-womanish refinement and amiableness, and you would think of her again when alone, if there were not so many of her about as to divide and dilute, as it were, your impressions.

The every-day young lady is usually dependent upon somebody or other, but sometimes she has a small independence, which is much worse. In the former case she clings like ivy, adorning, by her truth and gentleness, the support she is proud of; while in the other she gives her L.30 a year to a relation as an inadequate compensation for her board and clothing, and lives in a state of unheard-of bondage and awful gratitude. Her life is diversified by friendships, in which her own feelings last the longest; by enmities, in which she suffers and forgives; and by loves—though almost always at second hand. She is a confidant, a go-between, a bride-maid; but if she finds herself on the brink of a serious flirtation, she shrinks into her own foolish little heart in surprise and timidity, and the affair never becomes anything but a Mystery, which she carries with her through life, and which makes her shake her head on occasions, and look conscious and experienced, so as to give people the idea that this young lady has a history. If the affair does go on, it is a public wonder how she came to get actually married. Many persons consider that she must have been playing a part all along for this very purpose; that her timidity and bashfulness were assumed, and her self-denial a *ruse*; and that, in point of fact, she was not by any means what she gave herself out to be—an every-day young lady.

For our part we have known many such young ladies in our day—and so have you, and you, and you: the

world of society is full of them. We have a notion of our own, indeed, that they are *the sex*; or, in other words, that they are the class from which are drawn our conventional notions of womankind, and that the rest—that is, those women who have what is called character—are counterfeit women. The feminine virtues are all of a retiring kind, which does not mean that they are invisible even to strangers, but that they are seen through a half-transparent veil of feminine timidity and self-postponement. In like manner, the *physique* of women, truly so called, is not remarkable or obtrusive: their eyes do not flash at you like a pistol, nor their voices arrest suddenly your attention, as if they said, Stand and deliver! That men in general admire the exceptions rather than the rule, may be true, but that is owing to bad taste, coarseness of mind, or the mere hurry of society, which prevents them from observing more than its salient points. For our part we have always liked every-day young ladies, and sometimes we felt inclined to love a few of them; but somehow it never went beyond inclination. This may have been owing in part to the headlong life one leads in the world, but in part likewise—if we may venture the surmise—to our own sensitiveness preventing us from poking ourselves upon the sensitiveness of other people.

A great many every-day young ladies have been represented in the character of heroines of romance; but there they are called by other names, and made to run about, and get into predicaments, so that one does not know what to make of them. The Countess Isabelle of Croye is an extremely every-day young lady; but look how she runs away, and how she sees a bishop murdered at supper, and how she is going to be married to a Wild Boar, and how at last, after running away again, she gives her hand and immense possessions to a young Scotsman as poor as a church mouse! Who can tell, in such a hurry-scurry, what she is in her individuality, or what she would turn out to be if let alone, or if the author had a turn for bringing out every-day characters? Then we have every-day young ladies set up for heroines without doing anything for it at all, and who look in the emergencies of life just as if they were eating bread and butter, or crying over a novel at home. Of such is Evelina, who has a sweet look for every person, and everything, in every possible situation, and who is expected, on the strength of that sole endowment, to pass for a heroine of every-day life. This is obviously improper; for an every-day young lady has a principle of development within her like everybody else. If you expose her to circumstances, these circumstances must act upon her in one way or another; they must bring her out; and she must win a husband for herself, not get him by accident, blind contact, or the strong necessity of marrying—a necessity which has no alternative in the case of a heroine but the grave.

Such blunders, however, are now at an end; for a real every-day young lady has come out into public life, and an illumination has been thrown upon the class, which must proceed either from one of themselves or from inspiration.* But we are not going to criticise the book; for that would bring us to loggerheads with the critics, not one of whom has the least notion of the nature of the charm they all confess. This charm consists in its painting an every-day young lady to the life, and for the first time; and it by no means consists, as it is said to do, in the plot, which is but indifferently concocted, or in the incidents, that are sometimes destitute both of social and artistical truth. Anne Dysart herself, however, is a masterly portrait. Its living eyes are upon us from first to last, following us like the eyes of those awful pictures in the dining-room of long ago, which we could not escape from in any corner of the room. But Anne's eyes are not awful: they are sweet, calm, gentle. The whole figure is associated with the quieter and better parts of our nature. It comes to us, with its shy looks and half-withdrawn hands, like somebody we knew all our lives, and still know; somebody who walks with us, mellowing, but not interrupting our thoughts; somebody who sits by us when we are writing or reading, and throws a creamy hue upon the paper; somebody whose breath warms us when it is cold, and whose shadow stands between us and the scorching sun; somebody, in short, who gives us assurance, we know not how, of an every-day young lady.

To paint a character which has no salient points demands a first-rate artist; but to see the inner life of a quiet, timid, retiring mind, is the exclusive privilege of a poet. To suppose that there is no inner life in such minds, or none worth observing, is a grand mistake. The crested wave may be a picturesque or striking object in itself; but under the calm, smooth surface of the passionless sea there are beautiful things to behold—painted shells, and corals, and yellow sands, and sea-plants stretching their long waving arms up to the light. How many of us sail on without giving a glance to such things, our eyes fixed on the frowning or inviting headland, or peopling the desert air with phantoms! Just so do we turn away from what seems to us the void of every-day life to grapple with the excitements of the world.

Anne Dysart is not Miss Douglas's Anne Dysart: she is yours, ours, everybody's. She is the every-day young lady. The author did not invent her: she found her where the Highlandman found the tongs—by the fireside. And that is her true position, where alone she is at home. When she goes into society, unless it be among associates, she is always under some sort of alarm. She is told that there is company in the drawing-room, strangers come to visit—young ladies celebrated for their beauty and accomplishments—and she treads the stairs with a beating heart, feeling awkward and ignorant, and enters with a desperate calmness. The visitors, however, like her, she is so modest and unobtrusive; and the every-day young lady is charmed and even affected by their patronising kindness. She is reputed by these persons as 'a nice girl, rather amiable-looking, but not in the least like the heroine of a novel.' When she visits them in return, she is at first oppressed with a feeling of shyness, but at length still more overpowered by the kindness with which she is received, and she walks to the window to conceal her emotion.

* Anne Dysart, a Tale of Every-day Life. 3 vols. London: Colburn. 1850.

In this position our Anne—for we deny that Miss Douglas has any special property in her—comes out strong: 'As Anne now stood, dressed in deep mourning, the blackness of her garments only relieved by a small white collar and pair of cuffs, the expression of her countenance very pensive, her eyes shining mildly in the sunlight which was reflected from the crimson curtain upon her at present somewhat pale cheek, Mrs Grey, as she whispered to Charlotte, "Really, poor thing, she does look very interesting!" felt the influence of her peculiar charm, without, however, comprehending its source.'

Anne attracts the attention of one of the company, a harsh-featured, ungraceful person, under forty, with a large mouth, determined lips, deep-set thoughtful eyes, and a confused mass of dark hair hanging over a large and full forehead. Whereupon she instantly feels uncomfortable and frightened. But for all that, it is settled that the *bête noir* walks home with her; and resting the tips of her fingers on his arm, onward they go, these two fated individuals, in solemn silence. The conversation which at length begins consists of unpolite questions on the gentleman's part, and constrained answers on that of the lady; but at length she is saved from replying to a specially disagreeable and impertinent interrogatory by stumbling over a stone.

'Did you fall on purpose?' said he. The every-day young lady is both frightened and displeased, and being further urged, feels something actually resembling indignation. When they part, it is with a feeling on her part of inexpressible relief, and she thinks to herself that she had never before met so singular or so disagreeable a man.

This is unpromising: but it is correct. The every-day young lady *thinks* of the rough, odd man; and he is struck now and then by a word or a look in her which piques his curiosity or interests his feelings. He at length learns to look into her calm, soft eyes, and sees through the passionless surface of her character some precious things gleaming in its depths. The following quotation will show at what length he arrives:—'Anne pondered for a few minutes. She had a rather slow though a sound understanding. There was some truth in what Mr Bolton said, but so great a want of charity, that she felt from the first as if, some way or other, he could not be quite right. It was some time, however, ere she discovered how he was wrong, and even then perhaps could not have defined it. She answered gravely and modestly, but with less timidity than usual.

"But still, Mr Bolton, it is possible to be both agreeable and sincere. I know it is possible, because I have seen it; and I think that though there is some truth in what you say, yet, as far as my very limited experience justifies me in forming an opinion, I should say that truth, united with kindness, is appreciated; indeed I am sure some people have been liked who never flattered: I knew one person at least whom everybody loved, who would not have told a falsehood for the world, and who was all he seemed."

"I suppose you mean your father? Well, without exactly sharing in your filial enthusiasm, I am inclined to believe that he was a superior man."

"Are you indeed? Why, may I ask?" said Anne very timidly, and venturing for the first time to put a question in her turn.

"Why?" he repeated, with a momentary return of the wonderful smile. "Because his daughter has rather more simplicity of mind, rather more purity of heart,

rather more intelligence, rather less frivolity, rather less artifice, rather fewer coquettish tricks to flatter the vanity, and entrap the admiration, of silly men—in short, rather more *sincerity* than one meets every day: I guess she must have had a father somewhat above the average." Mr Bolton spoke in a low tone, and there was in his voice a depth and a softness that struck his listener's ear as being altogether different from its wont. Whatever this difference might be, however, it was not lasting, for when, after a moment's pause, he spoke again, it was with an exaggeration even of his ordinary harshness both of voice and manner: "But you need not fancy I am paying you a compliment. You are no angel; and even during our short acquaintance, I have discovered in you some faults and follies, and doubtless there are others behind. In some respects you are very childish, or perhaps it would be as correct to say *womanish*." With this rude speech, Mr Bolton concluded, drawing back with an air of having nothing more to say, and assuming a look which seemed to forbid any one to speak to him.

But this wild man chooses her for a wife, proposes for her hand—and is refused. Why so? Because she was an every-day young lady. He was rich; he had good points—nay, great ones, in his character: but he was an uncomfortable man. She could not love him, and she could not think of marrying a man she could not love. Had it been the young clergyman, the case would have been different. A nice young man was he; and, like all other young ladies of her class, Anne had her dreams of gentle happiness, and congeniality of temper, and poetry, and flowers, and sunsets, and a genteel cottage. But the young clergyman could not afford to think of an almost penniless girl for a wife; and so poor Anne's episode was ended before it was well begun; and the affair would have assumed in her solitary heart the enduring form of a Mystery, if exigencies had not arisen to call forth feelings and resolves that brook no such unsubstantial companions.

This every-day young lady had a brother in Edinburgh, and the brother fell into folly, and misery, and sickness, and desperate poverty. He wanted a friend, a nurse, a servant, and she knew that his bedside was her natural post. The difficulty was to get so far with her poor little funds; but this is accomplished, and instead of the outside of the mail on a wintry night, she has even had the good-fortune to enjoy an inside seat, some gentleman being seized with the caprice of encountering the frost and snow. This gentleman, she discovers afterwards, is her discarded lover; and he—how many discoveries does he make! The every-day young lady, thrown into the battle of circumstances, rises with the strife. She who had been accustomed to sit silent, seeming to agree with others in what was untrue, merely from want of courage, now endures without flinching the extremities even of actual want. Now come out, one by one, obvious to the sight, the thousand beautiful things in the depths of her quiet mind; and the eyes of the odd gentleman are dimmed with emotion as he looks at them. Already had she begun to wonder at this man, to call his austerity melancholy, to grieve that he was unhappy, to think what he could be thinking about; and now, when she and her darling brother are saved, protected, held up by his strong hand, the hold he takes of her imagination communicates itself insensibly to her heart. His features lose their harshness; his deep-set eyes become soft; his lips relax; and finally, he cuts his hair. What more needs be said?

But we take leave to disagree with this individual in his idea that Anne Dysart has more simplicity, purity, and quiet intelligence than other every-day young ladies. She is, on the contrary, nothing more than a type of

the class; and the fact is proved by the resemblance in her portrait being at once recognised. We do not stand upon the colour of her hair, or eyes, or other physical characteristics, for these are mere averages, and may be very different in our Anne and yours; but her shyness, hesitation, and cowardice—her modesty, gentleness, and truth—these are stereotyped traits, and are the same in all. But when such qualities rise, or become metamorphosed, to meet the exigencies of life, how do we recognise them? By intuition. We acknowledge in others the principle of development we feel in ourselves. Our fault is, that we pass over as worthy of no remark, no careful tending, no holy reverence, the slumbering germs of all that is good and beautiful in the female character, and suffer our attention to be engrossed by its affectations and monstrosities. Let us correct this fever of the taste. Let us learn to enjoy the still waters and quiet pastures. When we see an every-day young lady flitting about our rooms, or crossing our paths, or wandering by our side, let us regard her no more as if she were a shadow, or a part of the common atmosphere, necessary, though unheeded: let us look upon her with fondness and respect, and if we would be blessed ourselves, let us say—God bless her!

L. R.

INDUSTRIAL GLASGOW IN 1850.

To investigate the condition, effective force, and prospects of an industrial population, is a business not only interesting to the philanthropist, but highly useful also to society at large, as acquainting them with the habits and powers of a distinctive class little known out of its own sphere of action (except by its effects); at the same time that such an inquiry serves also reflectively to stimulate afresh the energies of the artisan, and cheer him onward in his uphill road, through trials and privations, to comfort and independence. Such were the works undertaken, and well performed, by Jelinger Symons, Baines, Gaskell, Bowring, and Villermé; and the writer of this article conceives that by describing the results of his own investigations respecting Glasgow and Clydesdale, he may possibly contribute some small mite of instruction as well as entertainment to the readers of this widely-extended Journal; his present object being to do for Glasgow and Clydesdale in 1850 what Cleland did for Glasgow alone at the beginning of the century—that is, to present a descriptive and moral picture of the city and its connected towns (more especially with reference to its artisan population) in the middle of the nineteenth century.

Glasgow may be said to form the centre of an industrial district, including parts of the counties of Lanark (its own county), Renfrew, Dumbarton, and Ayr. It is not in our power to give a minute account of this remarkable region, but we shall notice the chief subordinate places where commercial and manufacturing industry has taken root. These are—Paisley, the first shawl depôt in the world; Greenock and Port-Glasgow, shipping ports; Kilmarnock, eminent in carpet-weaving; Pollockshaws, Barrhead, Johnston, and other Renfrewshire villages, containing large cotton-spinning and weaving establishments; the Vale of the Leven, including Dumbarton, and the villages of Renton and Alexandria; Lanark and New Lanark, Blantyre, Campsie, and Balfour, towns full of cotton-manufacturing industry; Dalmarnock, Tollcross, and Rutherglen, villages close to Glasgow, and forming an intimate part of its own system of industry; finally, the great iron-mining and iron-founding villages of Airdrie and Coatbridge, the rise of which to importance within the last few years has been one of the most interesting phenomena

of its kind which the history of industry in Scotland presents. Eleven of these various clusters of population gave the following results at the census of 1841:—

Glasgow (parliamentary burgh),	255,650
Greenock (parliamentary burgh),	35,645
Port-Glasgow,	6,943
Paisley,	60,487
Lanark,	7,680
Pollockshaws,	5,390
Renfrew,	2,014
Rutherglen,	5,623
Dalmarnock and Tolcross,	4,000
Blantyre Works,	1,700

So rapid, however, and so constant has been the increase of buildings and immigrants within the last nine years, that Glasgow itself was estimated at the end of 1849 to contain 367,000; in which case these towns cannot comprise less than 650,000 inhabitants.

The Clyde, as far as regards marine navigation, is far more indebted to art than nature, for Commissioner Tucker, in 1652, describes the shallowness of the river as 'every day more and more increasing and filling up, so that no vessel of any burthen can come up nearer the town than fourteen miles, where they must unload and send up their timber on rafts, and all other commodities by three or four tons of goods at a time, in small cobbles or boats of three, four, or five, and none above six tons a boat.' Nay, our fathers, only seventy years ago, would have deemed that man insane who should have ventured the prediction that sea-borne vessels of 400 tons, from distant foreign shores, would ever unload their freight on the quays of Glasgow. Yet all this and more has been effected: a broad, straggling, shallow stream has been made a narrow and a deep one by an almost incredible amount of human talent and labour, and at vast expense. Whinstone, ashlar-like embankments, and extensive quays of solid, well-wrought masonry, have been constructed to confine its waters within a channel seldom more than 400 feet in breadth; steam-dredging machines have been for years at work in deepening the channel, and preventing the accumulation of deposits; and beacons have been erected to mark the deep-water channel, where requisite, all the way to the Firth; in short, all the resources of such master-minds as those of Smeaton, Watt, Bell, Rennie, Telford, and Walker, have been brought into play to make Glasgow a first-class river-port, and the Clyde—what it now indisputably is—the pride and glory of North Britain. Upwards of a million and a-half has been spent on these improvements, and the result of the deepening of the river is, that it can now be navigated by vessels of 1000 tons. The harbour now comprises fully 10,000 feet of wharfage, more than half of which is provided with powerful cranes, sheds, and ample weighing-machines, for landing, sheltering, and valuing the goods; and such is the amount of accommodation, that large ships of every flag now come into the heart of Glasgow to exchange the raw produce of the Mediterranean, United States, Brazil, the East and West Indies, and Canada, for the manufactures of Clydesdale. This port likewise, which was the first in Britain to engage in steam navigation, can now boast of a steam fleet unequalled out of London. Large and powerful mail-steamers, in the continental as well as home service, float like leviathans in front of the Broomielaw landing-wharfs. One war-steamer, called the *Simoom*, designed for the Indian seas, sailed about three months ago; a splendid screw steamer, the *City of Glasgow*, has lately commenced an intercourse with New York. Such is the Clyde in the middle of 1850.

Turn we now from the Clyde to the city through which it flows, and we shall see no less marked indications of a wonderfully-rapid progress and improvement. What in the sixteenth and seventeenth centuries was a quaint, shabby old town, straggling down from the Cathedral and episcopal palace to the Trongate, Saltmarket, and Briggate, with a population even at the Restoration of only 14,700 persons, has, within the last

forty years, become a fine, tastefully-built city, covering upwards of 450 acres, and boasting of wide avenues, squares, crescents, and terraces, which may almost vie with the modern squares and streets in the western or court end of London. We here subjoin the population from the five parliamentary returns:—

1801,	77,385
1811,	100,749
1821,	147,043
1831,	202,426
1841,	255,650
1850 (estimated),	367,000

Glasgow is essentially a busy mart, a money-getting place, in which the merchant and the manufacturer—with different, widely-different occupations, but harmonising interests—vie eagerly in shrewdness and wary, but by no means unadventurous trading. The merchant wants manufactured goods to send abroad; and the manufacturer is ready to furnish woven fabrics, or chemical products, or manufactured iron, as the case may be, and these too of a sort and quality just suited to the markets to which they are to be consigned. Thus as respects woven fabrics—separate kinds are prepared expressly for certain parts of the world; for what will please a quaint Chinaman will not suit the gaudy taste of a Brazilian or Peruvian; nor would the articles suited to the refined, sober taste of a German, suit a volatile Frenchman or even a London lady. All these transactions, on a truly gigantic scale, are daily carried on with little bustle and no waste expenditure of time, for a ten minutes' interview will often effect the exchange of thousands on a single bargain.

The following statement, which has been drawn up after much patient investigation and inquiry, but can, after all, be only regarded as an approximation to the truth, represents the textile industry of Glasgow in 1850—first, as regards the firms of master manufacturers; and secondly, as regards the labourers in their mills, factories, and print-works:—

TEXTILE ARTS OF GLASGOW IN 1850.

	Firms.	Labourers.
Cotton, Woollen, and Thread-Spinners,	76	25,000
Power-loom Weavers,	24	3,640
Handloom Weavers,	-	3,200
Calico Manufacturers,	240	4,000
Gingham	37	1,840
Muslin	40	920
Silk	22	720
Lace	16	140
Carpet	5	260
Shawl	10	64
Woollen and Worsted Manufacturers,	14	1,570
Rope and Sail Makers,	45	840
	529	42,194
Dependent Trades.		
Printers and Bleachers,	64	1,300
Dyers,	50	1,400
Calenders and Packers,	40	200
Designers and Block-Cutters,	35	500
Cylinder Engravers,	6	750
Miscellaneous,	150	700
Total,	882	47,924

Here we have about 900 firms, consisting, we will say, on an average, of three partners each; and employing, one with another, twenty clerks, packers, and porters—amounting in round numbers to about 20,000 persons—who keep at work in the production exclusively of textile goods, about 48,000 persons. This makes a total of about 68,000 persons supported by weaving industry within the city of Glasgow; and if to these we add 370 more firms consisting of 9300 partners and dependents, employing about 6000 persons in the conversion to useful purposes of iron, glass, porcelain-clay, chemical products and mineral coal, we shall then have a grand total of 84,000 persons directly supported by the manufacturing industry of Glasgow!

This estimate, however, falls very, very far short of the amount of population supported by manufacturing labour within the circle which owns Glasgow as its

central market. The following statement of the people supported by the spinning and weaving business out of Glasgow is as nearly correct as circumstances will admit:—

Paisley, -	49,000
Barrhead,* -	1,610
Greenock, -	3,400
Kilmarnock, -	-
Lanark and Blantyre, -	-
New Lanark,† -	1,094
Airdrie and Coatbridge, -	-
Glasgow itself, -	88,000

The principal crafts of Glasgow calling for notice, independently of the corresponding arts practised in England, are:—

1. Turkey-red dyeing;
2. Gingham weaving;
3. Shawl weaving;
4. Carpet weaving;

And to these arts we must add specially the wonderful factories for the

1. Reduction of iron ore to pig-iron and steel; and
2. The manufacture of large iron-castings, steam-engines and steamboats; and likewise
3. The sail-cloth works of Greenock;
4. Chemical works.

1. *The Turkey-red dye*, which is of recent introduction, is one of those complicated processes involving many details of operation, of which it would be hopeless to attempt any generally intelligible explanation within a reasonable space. *Red madder* forms almost exclusively the dyeing material; but the brilliant red colour requires for its production much care and many processes; repeated dyeings, washings, and bleachings over and again repeated, till the bright, unmistakable red, with its bright white spots, round, lozenge-shaped, or of indefinite pattern, is produced.

2. *Gingham Weaving* is a far more easy process than almost any followed in the district, except calico-weaving, and consists simply of the admixture in the warp or weft of those of white and coloured thread. Both ginghams and pullicates may be either of linen or cotton, or both mixed, and the work is commonly performed by wretched, impoverished handloom weavers, residing in the close, unhealthy districts of the city, or dispersed in squalid hamlets through various parts of the suburbs.

3. *Shawl Weaving*, which now forms the staple trade of Paisley (employing about 6000 hands, working about the same number of harness-looms, with upwards of 4000 women and children, employed in cotton mills, turning about 80,000 spindles), was introduced into that town about thirty-five years ago by a Mr Paterson, who, although there had been imitations made twenty years before in Norwich, Stockport, and Edinburgh, was the first to make it a profitable speculation. In 1823 China crape-shawls were introduced, and various fabrics have from time to time been manufactured for the English and foreign markets, including zebras for Anatolia,

* This village of Barrhead has no place in history; few of the people of Scotland, excepting in Glasgow, and still fewer of the people of England, have ever heard its name mentioned. It is not a burgh; it does not even give name to a parish. Yet what an amazing mass of industrial energy it is! Besides the large cotton spinning and weaving factories employing the above 1610 hands, it contains nine large bleaching establishments, at which 1800 hands are employed; four great calico-printing works, employing 1370 persons; a flour-mill, an iron foundry, a machine-shop, &c. employing in all about 200 hands. Thus the grand total of working people in this village is 4980.

† The cotton-mills of New Lanark now employ fewer hands than in Mr Owen's time, fewer being required to do the same amount of work. The total is 1056. The village contains 38 hand-loom weavers. The educational system retains little or no trace of its originator. It consists of, 1st, a day-school, at which the ordinary branches of education are taught, together with natural history, singing, and dancing, and which is attended by 300 pupils; 2d, an evening school. There are six teachers, four male and two female, paid immediately by salaries from the proprietors.

Syria, and the caravan trade of the East. The Thibet cloth manufacture, however, and that of Cashmere wool, were not introduced till the year 1830, since which period they have made such enormous advances, that the Paisley fabrics now equal those made some years ago by Ternaux and Girard in France. For some years, what with Morrison's improved Jacquard loom, Vergniai's steam metallic rollers, and the numerous improvements introduced by Messrs Kerr, Roxburgh, and Balderston, the shawl-trade of Paisley may be said to stand without a peer in its own department throughout the world.

4. *Carpet Weaving*—which, according to the methods now pursued, presents striking analogies to the shawl business, deserves a special notice with reference to the industry of Kilmarnock and its dependent villages—must be described at some length. Carpets—once a luxury of the rich, now a necessary to all but the poorest—were once manufactured in Kidderminster, Wilton, and some few other districts of southern England; but we are not far from the mark when we say that, in 1850, four-fifths of all the carpet-loom produce of Great Britain is manufactured either in Glasgow or Kilmarnock. In the latter town there are in all 480 looms for carpet weaving, producing annually 782,380 yards, chiefly of the superfine quality (besides rugs), estimated in all at £118,080. So much for the once-despised value of Scotch-carpeting! In fact velvet-faced, Victoria-patterned, Wilton, Brussels, and, in short, all descriptions of carpets or rugs, from Persian and Turkish patterns down to the lowest descriptions of druggeting, are now made in the west of Scotland, and sent to all parts of the world.

Thus far have we expatiated on the weaving-business of this industrious district, not with any invidious view, but merely to show what may be done by the active industry of a new district. The cotton-manufactures of the Clyde belonged formerly to Lancashire; the great woollen-industry of the West-Riding of Yorkshire, once the undoubted possession of Wiltshire and Gloucestershire, is now fairly domiciled in Lanarkshire; and the carpet-weavers of Wilton and Kidderminster have found more than rivals in the denizens of Kilmarnock and Clydesdale. The annual value of all these textile products can scarcely be estimated, going as they do both landward and seaward; but the total produce must unquestionably exceed ten millions annually of money revenue.

Let us observe, moreover, that the textile manufactures of Glasgow and Clydesdale do not form more than two-thirds of the whole industry of the district, even when we include their supplemental businesses—such as pattern-designing, cylinder-engraving, block-cutting, shuttle-making, &c.

METALLIC RESOURCES AND MANUFACTURES.—The conversion of mineral produce into articles of necessity and luxury constitutes a branch of industry equally important with, but quite distinct from, those hitherto described; but without these as adjuncts and providers of manufacturing power, the textile arts could not possibly have attained the high importance which they at present possess.

The whole of Middle and Lower Clydesdale is, in fact, nothing more nor less than an immense bed of coal and ironstone lying on a substratum of carboniferous limestone, admirably suited and extensively used for building materials; and this itself rests on a vast mass of gray-wacke, which forms, as it were, the bounding-wall of the coal-field. Coal-pits and iron-mines, therefore, dot the country in all directions for five or six miles around the city; besides which, all the knolls about Airdrie, Coatbridge, Garnkirk, Gartsherrie, &c. bristle with shafts clearly indicative of a vast amount of coal and iron-mining industry. There are in all about a hundred firms and companies engaged in smelting pig-iron, turning it into large castings, and converting it into malleable iron, the whole produce thus manufactured from the black-band ironstone, averaging about 600,000 tons

per annum. Some of the principal of these iron-works are the following:—

Messrs Dixon's at Govan and Calder,	13 furnaces.
Messrs Bairds' at Gartsherrie,	16 ..
Mr Wilson's at Dundyvan,	10 ..
Messrs Dunlop at Tolcross,	9 ..
Monkland Iron Company,	6 ..

All these, as well as several others, employ, instead of the cold-blast, formerly in use, the patent hot-blast, invented by Mr Neilson, which, on attaining the temperature of 600 degrees Fahrenheit, enables the iron-master, with three-sevenths of the fuel formerly employed, to make one-third more iron of a superior quality by the use of coal instead of coke. The advantages of this invention, moreover, are not confined to iron-masters; for the founder, by its use, can cast into goods an equal quantity of iron in far less time, and with the saving of nearly half the fuel employed in the ordinary process, while the blacksmith can produce in the same time one-third more work with much less fuel than he formerly required. The number of men employed in iron and coal mining, and in smelting furnaces, &c. may be thus stated:—

Miners and Colliers,	18,000
Carters, &c.	7,000
Weighers, Clerks, &c.	2,500
Total,	27,500

This is perhaps rather under than over the mark, as no data present themselves of any value later than those to be found in the last census.

Steam-Engine and Iron-Ship Factories.—The business of steam-engine making, so necessary both as an agent of the textile manufactories and as an indispensable requisite for the navigation of the port, has been conducted on the most gigantic scale for more than a quarter of a century, although in this respect it has a strong competitor in Greenock. It would be invidious to single out any firms in particular where so many are engaged in one or other of the branches; all having extensive works admirably arranged, and producing first-rate machinery constructed on the most modern and best-approved principles. The works of Mr Robert Napier, however, at the Vulcan and Lancefield Foundries, are of a nature so distinct from the rest, that we venture on a brief description of them and some of their products, being indebted for our information to the liberality of Messrs Napier themselves.

The manufactures carried on by these gentlemen, so far as concerns the steam-engines, are conducted in two immense factories, covering together nearly six acres of ground, well known in Glasgow as the Vulcan and Lancefield Foundries, besides which they have an extensive ship-building yard at Govan, about two miles below Lancefield on the opposite bank, and a gigantic forge at Parkhead provided with steam and tilt hammers, cranes, and other machinery for effecting the 'uses' or heavy forgings of the engine-shafts, cranks, crossheads, &c. &c. The founding business is performed on an amazingly large scale, and may be divided into three branches—loam-moulding, dry-moulding, and green-sand moulding. It is not an uncommon thing for fifty or sixty tons of molten iron to be employed in casting the cylinder-cases of first-class engines. The brass foundry is quite a distinct department, employed in rough-casting those kinds of engine work for which iron is unsuitable; five or six tons of brass being often used at a single operation! The second branch of the business comprises the boiler-manufacture, which employs a great number of hands as fitters up—that is, adapters of the various plates composing the boilers, and piercing the holes for the reception of the bolts, which the riveters hammer in with astonishing rapidity; the calkers following to close the seams firmly together after the riveting. The third branch includes a large number of machine-workers, who, by the aid of powerful and ingenious mechanism, effect, with a facility almost exceeding belief, borings of wondrous calibre,

planings and slottings of large metallic surfaces, screw-cutting, and numerous other ingenious operations indispensable for the nice adjustment of the various parts of the engines, the very same care and minuteness being required in the largest as well as the smallest members thereof. And fourthly, there comes the finishing department, which includes the turning of the minuter metallic portions of the engines, and the just fitting of various parts with reference to each other in the entire machine. Add to these various draughtsmen and pattern-makers, employed in making drawings and models, with forge-smiths, joiners, and painters, the whole comprising from 900 to 1000 workmen, and the reader may possibly form some slight notion (though a just one he cannot, without a personal inspection) of the vastness as well as variety of the works carried on at these factories. Mr Napier, moreover, contracts for every kind of workmanship and material necessary for the entire furnishing of his ships—such as the cabinet-work and upholstery, carving, ornamental painting and gilding, plumbing, and copper-work, internal furniture and bedding, sails, cordage, &c. &c.; and with respect to one department alone of the ornamental work, it may be stated, by way of example, that on the cabin of the *Emperor*, a steam-ship of 1300 tons now running between Hull and Petersburg, he expended no less than L.300 in artistic and decorative paintings. Nor is it at all unusual for sums varying from L.60 to L.100 to be paid for one or two pictures to adorn the cabin of first-class steam-ships.

The above works, moreover, are quite independent of the building-yard at Govan, where the various plates, beams, &c. are put together by ship-carpenters and iron-ship builders expressly devoted to this class of artisan-ship, about 500 or 800 in number, according to the amount of business going forward. Only a few months have elapsed since the splendid war-frigate already alluded to, the *Simoom*, was launched. Her dimensions are: length from figure-head to taffrail, 280 feet; breadth of beam, 42 feet; depth from deck to keel, 28 feet. This noble vessel, which will perhaps be the finest in the steam navy, has received an auxiliary screw engine. It may be stated, in conclusion, that even in cases where the vessels themselves are not built by Messrs Napier, but at Greenock, or elsewhere, this firm is employed to provide the engines; as in the case of the *Niagara*, an American steam-ship of 1830 tons, the engines of which are of 650 horse-power. We lately found the engines designed for the *Asia and Africa* in the course of building at Lancefield. They are each of 800 horse-power, and had a truly gigantic appearance as seen while being fitted together in the workshop. The *Asia and Africa* has since left the place of her nativity, and made her first voyage between Liverpool and Halifax—the quickest passage on record.

CHEMICAL WORKS.—The manufacture of chemical products is conducted at Glasgow on quite as extensive a scale as at Newcastle. There are several large establishments of this kind on the east and south sides of the town; but they all yield the palm to the works at St Rollox, belonging to Charles Tennant and Co., which now occupy nearly fourteen acres, about half of which space is under cover. The premises comprise upwards of 100 furnaces, retorts, or fireplaces, the smoke and effluvia from which are carried up a gigantic stalk rising 300 feet above the floor of the works, which is a landmark easily visible from all the surrounding neighbourhood. The articles manufactured are sulphuric acid, chloride of lime, soda, and soap; and so alive is the proprietor to the necessity of introducing all the recently-discovered processes, that he has been known to give—over and above the liberal salaries paid to resident chemists—the apparently enormous sums of L.1000 and L.1500 for the exclusive use of a single new process or discovery. In fact the establishment of St Rollox may be fairly pronounced as unequalled in the world.

Glasgow has likewise several pretty large glass-houses; but they will not bear comparison with the

vast establishments of Newcastle, St Helen's, and other towns south of the Border.

Having thus concluded our brief description of the leading branches of manufacturing industry in Glasgow, we proceed to offer a few statements that may illustrate the progress of steam navigation in particular, and also of the navigation generally connected with and issuing from the port of Glasgow.

After several fruitless exemplifications by Messrs Miller, Symington, and others, during the last century, of the possibility of applying steam to the propelling of vessels, Mr Henry Bell of Glasgow applied to a boat purposely built for him a pair of paddles set in motion by an engine of three-horse power, made by himself; and after several experiments this first steamboat on British water, the *Comet*, began plying between Glasgow and Greenock, January 18, 1812, when it succeeded; and it was regarded quite as an exploit that it made *five miles an hour* against a head wind! We insert here, as curious, an advertisement from a Glasgow paper, August 5, 1812:—

‘STEAM-PASSAGE BOAT.
THE COMET.

BETWEEN GLASGOW, GREENOCK, AND HELENSBURGH.
FOR PASSENGERS ONLY.’

The first steamers that ventured out of the Clyde into the open sea were the *Britannia* and *Rob Roy*; the former trading to Londonderry, the other to Liverpool, and thence to Dublin; soon after which, the number of steamers gradually increased, though the engines were still of a clumsy and ponderous make, with many parts attached that were subsequently found wholly unnecessary. A curious circumstance, too, deserves mention, as showing how mere accident may lead to great improvements. The fly-wheel of one of these early engines having got out of repair, it was found that the vessel went on just as well without it, owing to its own momentum; and consequently from that time forward this maintaining power was disused.

It forms no part of our present purpose to detail the progressive improvements in steam navigation during the last thirty years. Enough be it now to mention, that at the close of 1849 Glasgow possessed *seventy* steam vessels: four to Liverpool—the *Admiral*, *Commodore*, *Orion*, and *Princess Royal*, all from 350 to 600 tons burthen, and the two latter of iron; four to Belfast—three of which are of iron, and all from 250 to 500 tons; five to Londonderry and Sligo, from 150 to 400 tons, mostly built at Mr Napier's yard; three to Dublin; two to Campbeltown; one to Stranraer; and nine to the Western Highlands (six of iron); besides which, twenty-four steamers were plying up and down the Clyde, varying from 80 to 120 tons, ten of which ran to Gourock, Dunoon, and Rothesay, five to Largs and Millport, six to Helensburgh, and three to Dumbarton: there being also eighteen tug-boats employed in towing large sailing vessels up and down the river. Since then, in emulation of Liverpool, the first steam-packet has begun to ply direct to New York. These vessels are fitted up with engines of four different descriptions, either oscillating, diagonal, side-lever, or what are termed *steeple-engines*—these being now more frequently used than any other. The number of passengers conveyed in various directions by these floating towns cannot be calculated with any approximation to accuracy; but it must be enormous. In the summer season, when the good citizens of Glasgow are wont to ruralise with their families at Helensburgh, Gourock, Dunoon, Rothesay, Largs, Millport, &c. the steam quay at the Broomielaw presents, especially on Saturdays, an amusing scene of bustle, from the vast numbers of persons in every rank, and of both sexes, who are hurrying away from the smoky city to inhale the fresh breezes of the western ocean.

Pleasure, however, forms but a small part of the business connected with the marine navigation of the Clyde, inasmuch as the largest steam-ships engaged on the

Liverpool and Irish stations are extensively employed by the merchants and manufacturers for the transport both of the raw material and manufactured produce, as well as of large quantities of provisions, fresh as well as salt, from the various ports of Ireland.

Having thus presented an outline of the internal industry, trade, and navigation of Glasgow, we shall next invite attention to a subject equally interesting, though in some respects painful—the state of morals and health among the industrial classes in the Clydesdale district.

‘MODERN MYTHS’—THE GENTLEMAN
BAGPIPER.
